There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us $1 with a new name for next year (1901), we will send the new subscriber the balance of this year’s (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey covers. Better send two new subscribers (with $2.00) and get the three pounds of seed. Address

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.

---

**Extracted Honey For Sale**

**ALFALFA HONEY**

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can’t get enough the Alfalfa extracted.

**BASSWOOD HONEY**

This is the well-known light-colored honey gathered from the rich, nectar-laden Basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

**Prices of Either Alfalfa or Basswood Honey:**

A sample of either, by mail, 8 cents; samples of both, 15 cents—pay to order and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box. This is all

**ABSOLUTELY PURE BEES’ HONEY**

The finest of their kind produced in this country.

Read Dr. Miller’s Testimony on Alfalfa Honey:

I’ve just sampled the honey you sent, and it’s prime. Thank you. I feel that I’m something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there’s no denying the fact that for sale in the kind of hot drink, where one prefers the more wholesome honey to sugar, the more the excellent quality of alfalfa honey I have received from you is better suited than the honey of more market flavor, according to my taste. C. C. Miller, McHenry Co., III.

Order the Above Honey and then Sell It.

We would suggest that those beekeepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.
Editorial.

1901—Volume XLI.—The first year of the new century is here—the 20th century. The first number of the 41st volume of the American Bee Journal is also here. The past century has seen so many wonderful improvements and developments, we suppose this new century we are just entering upon will be still more wonderful. That hardly seems possible, and yet it doubtless will be true.

But what of the old American Bee Journal in this 20th century? It also must keep step with the progressive spirit of this rapidly advancing age. And it will do so. We need not make any promises for the future to those who have been reading the old American Bee Journal during the past 10 or more, or even less, years. We mean to keep its standard up hereafter as we have tried to do in the past. We realize that this we can not do alone—we must have the hearty and continued support and encouragement of the bee-keepers themselves. We believe we will have it—at least we will endeavor to merit it.

We can all, then, look forward to the coming years with a strong faith and a high hope, realizing that in a united effort for the right we shall be successful in all that is worthy and true.

The Utter vs. Utter Case in New York State, which has been referred to in these columns several times the past few months, came to trial again, and was decided in favor of the bee-keeper, on Dec. 29th.

Mr. O. L. Hershiser, superintendent of the apiary exhibit at the Pan-American Exposition, being present and assisting during the trial, the following account written by him will be read with great satisfaction by all, and particularly by the members of the National Bee-keepers' Association, whose money helped their fellow member to win his case:

My Dear Mr. York—I enclose you newspaper clippings concerning the now famous case of Utter vs. Utter, and will request that remaining papers containing accounts of the case be forwarded to you by the publishers. In the meantime, let me tell you so you will have no dismal apprehensions concerning the result of the litigation, that the bees were entirely exonerated of the charge of mischief complained of. The case occupied over two days, the jury being nearly all drawn on Monday afternoon, and the jury's verdict brought in at about dusk on Wednesday evening.

For a case involving such insignificant damages, I've seen nothing that has created so much interest to lawyers and sensation to the people, in many a day, as did this case. It seemed to be the only subject of conversation for the people in the hotels, railway stations and stores, and by groups of people on the streets. Besides local witnesses, the plaintiff was able to call Mr. Bee-keepers from New Hampshire; and the defense, besides local witnesses, had several fruit-growers and apiarists from New Jersey, A. J. and E. R. Root from Ohio, Frank Benton from Washington, Mr. Marks from this State, and your humble servant as counsel for the plaintiff.

I understand the jury's first ballot was in 10 votes to 2 blanks for no cause of action, which was immediately made unanimous for no cause of action. They were out scarcely five minutes.

Was not that a complete victory?

Too much credit cannot be given the just judge for his fair and impartial attitude and rulings on every disputed point, and for the great learning and ability of Messrs. Bacon & Merritt. And while passing, I believe that trained counsel which did not know that learned and astute counsel were opposed to us in the persons of Messrs. F. V. Root and W. Sanborn, which were to some extent scholarly and gentlemanly members of the legal fraternity, and while they brought to bear their skill in all things, they were not hand in hand as we were. But as to acumen in this very bitterly contested case, I think that all on the opposite side will admit that they were treated in a gentlemanly and dignified manner.

Of course, you will observe that the scene of this fight was in the village of Anody, which, to say the least, was very ironical, that, metaphorically speaking, one brother fought to kill, or “do up” the other, and that this fratricide might be accomplished according to ancient usage, as recorded in Holy Writ. Kain was brought in to assist one of the brothers in his task, while, however, the plaintiff would not be disposed of in this summary manner, and knowing of a firm of brothers among the witnesses, it is possible he may be said to have been analogous to the Bible, W. Sanborn, who, in the course of the trial, called Mr. Utter his agent, enlisted him in his behalf. These lawyers were sent on (sent to) the actuality, as it were, and appropriately, sent for certain gentlemen from Washington and Ohio to assist him in getting out of the difficulty. However, the plaintiff's claims were made apparent to all observers, after the gentleman from Chapinville had made Marks of his witnesses, by proving to the jury that in their claims that bees puncture peaches they were simply making a counterfeit case for him. And now thinking that the case was fairly made, it was judicially settled that the claims of the plaintiff were too Utterly Utter, I think we are justified in believing that peace will reign in Anody again. Yours truly,

O. L. Hershiser.

From the clippings kindly sent us by Mr. Hershiser, we take these paragraphs, the newspaper in which they appeared being the Middlesex (N. J.) Daily Argus:

The case was opened for the plaintiff by Mr. Sanford. He said he asked only $800 damages; that the case was not one which charged that peaches and trees had been destroyed by stinging. He claimed about as follows: The two Utters lived near Anody, in the town of Garewick, with their peaches, the other is a keeper of bees. William II, owns 4,000 peaches. Forty rods from one of his orchards is a clump belonging to several of his brother's. The bees from these hives acquired the habit of flying over to the orchard and "puncturing" his peaches, seeking the fruit, and making great quantities of it unfit for market. The juice trickling from the fruit would form a substance about the branches of the trees, which, in time, destroyed the branches, and in time 49 trees were totally destroyed.

Wm. II, Utter, the plaintiff, was the first witness. This is the substance of his testimony: On July 5th last, he walked into his orchard and noticed there were many bees among his peach-trees. Every day after that the bees began to get thicker and thicker. He counted as many as 14 bees on a peach, and saw so many others on other peaches that he couldn't count them. He watched their operations. A single bee would come up to the peaches, walk all around it, pick out a good spot, and put its nose in. Then it would wiggle its head one way and then it would wiggle it another. Then it would stand upon its feet and pull out its nose. Then another bee would come and the hole. Then a third and the fourth, and a whole dozen bees would come to that peach, and in less than a week the peach would die.

This is the way he found out that the bees were from his brother's hives: He built a box and put flour in it. Then by another con- trivance he caught a lot of the bees on his peach, put them in the flour-box, and when they had become white he permitted them to escape. Then he followed their line of flight, and in most cases they went directly to his brother's hives.

Next week we hope to have a further report on this celebrated case.

Clarifying of Wax.—It is a good thing to have the same thing viewed by many eyes, thereby reaching it from all sides. Regarding the clarifying of wax, the following kind note is received:

My Dear Mr. York—Have you made any experiments lately upon the Hill about the cooling of wax? The real truth is, that the time taken in the cooling of the wax makes no difference whatever, it is in the length of time it remains in a molten condition. The effect on color will be exactly the same if the wax should be slightly heating instead of cooling all the time it remains melted. And I can not conceive how you could possibly give the meaning you did to the quotation you made from Mr. Hill.

O. O. Poppleton.

Decidedly Mr. Poppleton is correct, that the thing that makes a difference in the clarifying of the wax is the "length of time it remains in a molten condition," altho it is doubtful if any one has express the idea in that exact form before. But is it strictly correct to say that "the time taken in the cooling of the wax makes no difference whatever?" It is true that after the temperature of the wax has come down to the melting-point, it makes no difference whether it is ten seconds or ten years in getting down to the temperature of the surrounding atmosphere, but it does make a difference as to the time of the cooling of the wax down to about 145 degrees, just because the longer time it takes in cooling down to that point the longer time it is in the desirable melted condition.

Having agreed that slow cooling is not per se...
The thing desired, but only desirable because it leads to the right condition, the practical question comes, is it better to say to a beginner, "You must cool your wax slowly, " or "You must keep your wax a long time in a melted condition?" If he is told to cool his wax slowly, he will keep it long enough. If he is told to keep his wax in a melted condition, he will keep it a long time in a proper condition for the foreign particles to settle; at any rate, if any one has been misled by such a direction, it has not come to light.

Suppose, however, we try to be more exact, and say, "Your wax must remain a long time in a melted condition."

One can easily fancy him thinking. "Well, it will remain in a melted condition if I keep it hot, and I can just as well leave it on the stove half a day."

So it remains "in a melted condition" for half a day—not only in a melted condition, but at so high a temperature that the particles are kept constantly in motion, and there is no chance for impurities to settle; and then it is taken off and allowed to cool rapidly, with the result that impurities are mixed all through.

The best of all would be a full explanation. Since the foregoing was written, the Bee-Keepers' Review has come to hand, and Editor Hutchinson says:

"The trouble with Bro. York's argument, as I understand him, is that he is confusing purity, or freedom from dirt, with that of color. That is, he assumes that the dark color is due to the presence of dirt. We have found that this is not the case, and the brighter, yellower wax fairly loaded with particles of dirt. If kept a long time these particles settle to the bottom, but the color of the wax is not changed one iota."

There is no desire whatever to deny that two specimens of wax entirely free from impurities may be very different in color. But it is also true that a very large part of the beeswax thrown upon the market is of a very dirty nature, and that it is true that, even in the purest wax, there are "fairly loaded with dirt."

Now does Mr. Hutchinson mean to tell us that that dirt is of the same bright color as the wax when it is cleaned? Does a cake of it look just the same after cleansing as before? If the answer is in the affirmative, then there is something strange about the color of wax found in his locality. If a white handkerchief is covered with soot, we don't say it is white, but black.

Reformed Spelling. A correspondent writes that he would be a subscriber for life if it were not for the spelling which follows the rule: "Change it and of final t when so pronounced, as in baked (look), etc., unless the e affects the preceding sound, as in chafed, etc." He thinks until our lexicographers change the rule that makes the past tense and perfect participle of regular verbs end in ed there should be no change, and that it is a further injury to children who are learning to spell to read this journal.

It would be hardly worth while to refer to the matter except for some who are recent subscribers. To them some explanation is due for departing from the general custom. This departure is not a whim of the American Bee Journal, but it is the practice of all the best lexicographers of the world.

It is because our lexicographers, the ablest and best lexicographers of the world, have changed the spelling of a fact of which our correspondent does not seem to be aware. If he will turn to page xxi of the Standard Dictionary, he will find the matter treated somewhat extensively. The change is endorsed by the Philological Societies of England and America, and the Modern Language Association of America, the members of which include most of the recognized authority in linguistic science in England and America among them. Wm. K. Harris, LL.D., who for years has been the United States Commissioner of Education, and the late very able Max Muller, of England, with professors from leading colleges in both countries. There is no law compelling people to obey these rules, no more than there is to compel people to talk good English, but reforms having such strong arguments in their favor and urged by such high authorities, will surely prevail in the end, and it is the part of wisdom promptly to fall in with them.

If the father and grandfather of our correspondent had been of his mind, very poor would have been his chances for much modern literature, for they would not have allowed him to read a book that did not continue the spelling to which they had first been accustomed, such as honour, labour, Atlantic, arctic, etc.

Mr. Thomas G. Newman, for so many years editor of this journal, and also general manager of the National Bee-keepers' Union (a year ago united with the National Association), has this personal paragraph in the issue of his Philological Journal for Dec. 22, 1900:

The editor, in response to many requests for a public statement concerning his vision, would say that his sight is much improved, but his sight has not yet returned sufficiently to allow him to read or write. This condition has prevailed now for a year or more, than he has been taking daily magnetic or mental treatments the whole time, but he feels sure that full sight would soon return, if he could take a much-needed rest, the optic nerves being only partially paralyzed, thru excessive strain and overwork, which makes a need of rest, after the extra labor and care of the past year. Thomas G. Newman.

Mr. Newman's many old friends will all unite in the hope that he may soon have that necessary rest so that his eyes may recover. Also that Mr. Newman may join in the vacation.

Mr. Dady's Paris Credentials, which he mentions in his article this week, read as follows:

Mr. C. F. Dady.

Dear Sir,—I am pleased to inform you that the Board of Directors of the National Bee-keepers' Association, thru its chairman, Mr. F. A. White, has granted you this certificate of credentials, appointing you as their delegate to the International Congress of bee-keepers at Paris, or any other meeting of bee-keepers which you may be able to attend during your trip abroad. On behalf of the Association I wish you success in your trip.

Mr. Newman, we seriously wish that we could have it in your person of all these others the best fitted to represent American bee-keepers in Europe. It is a fact that only recently we have received a letter from a man in the United States saying that he had been working in the country for several years, covering many years of successful management with bees: your thorou acquaintance with the beeys of this country and Europe, your familiarity with the French language and customs, will all be a distinct advantage to you in the country and in Europe; and we shall be pleased to have you with us.

A. M. B.,

Mr. Newman, we are pleased to inform you that the Board of Directors of the National Bee-keepers' Association, thru its chairman, Mr. F. A. White, has granted you this certificate of credentials, appointing you as their delegate to the International Congress of bee-keepers at Paris, or any other meeting of bee-keepers which you may be able to attend during your trip abroad. On behalf of the Association I wish you success in your trip.  

Mr. Newman, we seriously wish that we could have it in your person of all these others the best fitted to represent American bee-keepers in Europe. It is a fact that only recently we have received a letter from a man in the United States saying that he had been working in the country for several years, covering many years of successful management with bees: your thorough acquaintance with the beeys of this country and Europe, your familiarity with the French language and customs, will all be a distinct advantage to you in the country and in Europe; and we shall be pleased to have you with us.

A. M. B.
Convention Proceedings.

BY DR. A. B. MASON, SEC.

(Continued from page 82.)

FEEDING BEES RIGHT OUTDOORS.

Suppose your colonies were away from other bees, wouldn’t it be safe to feed right outdoors to them, and let them carry it in?

Mr. Fixter—No.

Mr. Fixter—I have fed by placing the feeder on top of the colony I wish to feed in the evening about sundown, and by morning they would have it all taken down. Put in the syrup lukewarm.

Mr. Wood—I have had experience in feeding; after the bees are all thru breeding the best time to feed; then feed all at once. If it is cool weather warm the food. Con- fine the bees to the combs they can cover, don’t let them scatter, put the feed on top, and keep them warm.

FEEDING SUGAR SYRUP TO BEES.

Mr. Moore—Is there any particular danger in feeding granulated sugar from its solidifying in the combs? How can that be prevented?

Mr. Root—We never have any trouble, and our scheme is always to feed syrup thin, about half sugar and half water. If you make it a third water and two-thirds sugar you are liable to have some sugar solidify; you can avoid it a good deal by putting in water or some sort of acid. I think it is better to make it thin.

Dr. Mason—By adding honey you never have that granulated.

Pres. Root—You want to make it thin; make it about half and half; if you make it thin enough it won’t granu- late.

A Member—How early do you feed it?

Pres. Root—In September and October, in our locality, when the days are warm.

Dr. Mason—if you use much water the bees will have a great deal of work to do.

Mr. Fixter—Take 15 pounds of syrup, by the time that is in the cells when you have two parts sugar and one water, you have over 10 pounds of food left.

Pres. Root—You have to figure according to that when you feed that thin syrup.

Mr. Fixter—I have tried that, and weighed the hives before the bees were fed, and weighed them afterwards.

Mr. Green—Don’t you have trouble in feeding this thin food rather slow?

Mr. Fixter—I ask Mr. Root in feeding this thin syrup and feeding it rather slow (as I supposed he would have to), if he did not have trouble with getting the bees started to brood-rearing.

Mr. Root—Sometimes we feed 10 or 15 pounds at a time. The main idea in feeding thin syrup is to have the bees convert that syrup into honey.

Mr. Green—Sometimes it becomes necessary to feed bees in rather cold weather, and at such a time we must either mix it with honey, as has been suggested, or boil with tariaic acid and feed it then at a proper consistency, nearly the consistency of honey, and feed it rapidly.

Dr. Mason—If I understand you correctly, I think I have learned something, Mr. President. You say, “The main idea in feeding thin syrup is to have the bees convert that syrup into honey.” By adding white of water do the bees make the sugar syrup into honey? Is that so?

Pres. Root—I want to qualify that a little.

Dr. Mason—I guess you would better.

Pres. Root—Feeding it thin, one-half sugar and one-half water, the bees have an opportunity to invert it. Prof. Cook calls it “digest.” If you feed it too thick they won’t digest it and convert it into honey.

Mr. Abbott—I want to offer my protest so that the stenographer will be sure to get it, and the bee-keepers as-

sembled will be sure to understand it; that you can’t feed sugar-syrup of any kind, to any kind of bees, and have it converted into honey [Applause], Prof. Cook to the contrary notwithstanding.

Pres. Root—What I mean by that is, it is not the same you get from flowers. What I mean by honey—real honey— is nectar from flowers stored by the bees in the comb and converted into honey; but nectar in cane-syrup is a good deal like we feed. What I am afraid of is that, when written of now is chemical honey, and not commercial honey.

Mr. Abbott—Either chemical or commercial honey. If you feed them cane-syrup you reap cane-sugar when you eat it.

Pres. Root—It will be inverted, too. Mr. Abbott—No, it won’t be inverted; it will simply be cane-sugar.

Pres. Root—Where is President Abbott?

Mr. Taylor—There seems to be quite an issue between Mr. Cowan in his paper and Mr. Abbott.

Pres. Root—Mr. Abbott speaks of chemical honey or commercial honey. I don’t care whether they have nectar from flowers or sugar-cane; if you give them time enough they will make it to honey.

Mr. Moore—I will have to enter an emphatic protest against the use of this term “chemical honey.” You might as well say “glucose honey”; it is the same thing in the eyes of the public. I have handled a family trade for 15 years and I am one who would hold that lots of people have said to me, “Do you feed your bees sugar to make honey?” I say even a bee doesn’t make honey; she gathers honey from the flowers. You can’t give it to people in this dialectic way; if you do you won’t understand it. I tell them bee-keepers don’t practice that sort of thing. First, it doesn’t pay us. I state here, you can take lots of bees and produce honey cheaper than you can get it from sugar-syrup and other things. I tell them this.

Pres. Root—I can’t get your sugar-syrup into the combs; if you got it into the combs it wouldn’t be honey—it would be sugar-syrup in the combs; it wouldn’t pay. I am protesting against using terms that are misleading to the people who would understand them. They are asking me these ques- tions every day, and I must enforce personality on that party before I can get his confidence. For the benefit of our pursuit, and for bee-keepers generally, I think we must avoid the error of speaking in misleading terms, and thus leading to misconceptions of our pursuit. [Applause.]

Mr. White—When we talk about sugar-syrup let us talk about it as only feeding to winter our bees; that we never sell any of it; it is simply to live on; it is just as good. I believe, when it is “tinted” as you call it—I don’t want to know the term, anyhow—but it is just as good to winter our bees. I believe we can winter the bees on it all right, but let it go out that it is for feed and not for family use.

Pres. Root—If you feed the syrup too thick it will candy and go back to sugar. If you make it thin enough the bees will invert it.

Dr. Mason—Don’t use the word “honey” in that con- nection.

A Member—I always heat the syrup hot. I think that is one reason why it does not candy in the comb.

Mr. York—I want to emphasize what has been said about feeding sugar, and saying what it is used for when you feed it to bees. I am very careful what is said on this subject in the American Bee Journal. I help my corres- pondents to say what is used, as you call it—I don’t want to know the term, anyhow—but it is just as good to winter our bees. I believe we can winter the bees on it all right, but let it go out that it is for feed and not for family use.

Dr. Mason—This is really a serious matter; if it should go out to the public that our honored president has been advocating anything of that kind, it would be a great dam- age to our fraternity. We say we ought to keep this side—not to say it at all in the first place. I am in dead earnest about this. Mr. Moore knows what it means. If our president goes out on the market and peddles it from house to house he will find out he would better not say sugar-syrup any more.

Pres. Root—I concede the point Dr. Mason makes, and the point of Mr. Moore and Mr. Abbott, and all these others. I am willing to be corrected on that. I will, if you please, use the word “inverted.”

Mr. York—We should always say that we feed the bees for winter stores, or to keep them from starving. If the general public only did know, it wouldn’t do any harm. But it is hard to get them to comprehend the matter correctly.

Mrs. Dunne—I think in speaking of storing sugar for winter use, we should confine ourselves to the bare fact,
and say it is given to stimulate the bees for brood-rearing, to store for winter food, and give none of them to understand it is to be converted into honey for any purpose.

Mr. Abbott—I was writing a resolution, and don’t know as I just understood what was said, but I infer that you meant to use the bees to eat it or given it, it would go back into sugar; that syrup couldn’t be made to do it.—wouldn’t go back into sugar without the bees did something to it. I feed my bees sugar-syrup to winter them; they eat sugar-syrup, and live on sugar-syrup in spring. I carry them in sugar-syrup, when I feed, and when a bee eats it it is never anything else but sugar-syrup, and I don’t see any reason for calling it anything else.

Pres. Root—It is not chemically the same as it was before.

Mr. Abbott—It is absolutely the same as it was before, chemically; I can demonstrate clearly that it is so.

Pres. Root—I am only stating it as have Cowan, and Cheshire, and Dr. Headon of the Colorado Experiment Station, and other scientists—they called it “inverted.”

A. F. Morley—I have been reading that when bees are fed sugar-syrup they will fly out into the air and manufacture it over to some extent before they store it.

Mr. Fixter—if you allow the bees to store 25 or 30 pounds of syrup in the brood-chamber, aren’t they going to carry that over into the colony? That is how the sugar is converted. How are you going to separate the sugar-syrup from the honey?

Pres. Root—Not very liable to after that length of time.

SUPERSDING QUEENS.

Why should a colony refuse to kill the old queen when she has stopped laying, and a young queen has emerged, the colony finally swarming with the old queen that was clipt, there being no eggs or uncapt brood, and but little capped brood, the cell empty?

Mr. Aikin—For my part, I think there is a mistake somewhere; such things do not occur except as a freak, in all my experience.

Mr. Green—They occur pretty frequently.

Dr. Mason—You must be in a freak country; localities differ.

Will a colony superseding a queen swarm with the old queen after the young one is hatcht and in the hive?

Mr. Aikin—It is possible that the presence of two queens in the hive, the old and the young, might cause a disturbance; but where the colony would come out I should most certainly expect them to come with the young queen rather than with the old one.

REARING QUEENS.

How often would you put queen-cells in the same hive?

Mr. Aikin—I suppose this is intended for queen-breeder.

Mr. Hutchison—I put in queen-cells as often as I take out a queen.

Mr. Holdren—That isn’t the idea; I want to know, when you are making brood, how often would you put cells in the same hive to rear queens for sale?

Mr. Aikin—Isn’t your thought this: How many cells would you cause one colony to rear?

Mr. Holdren—Yes, sir; without giving them a rest.

Mr. Hutchison—Perhaps two or three—somewhere in that neighborhood. They will rear one batch of cells in ten days.

NUMBER OF COMB-SPACES WITH BEES FOR WINTER.

Taking the Langstroth frame for a standard, how many spaces between combs should be occupied by the bees for good wintering?

Mr. Aikin—I don’t know the number of spaces; that will depend upon the temperature, largely, and it varies so much the first of October that probably six or eight spaces would be right.

Mr. Burton—Five in sharp weather.

Mr. Abbott—I believe that would be pretty close.

Dr. Mason—Six makes a good, solid colony.

FORMING LATE NUCLEI.

How late can a nucleus be formed in northern Illinois, using a virgin queen, and build up strong enough to last until spring?

Mr. Aikin—That is out of my territory. I should say it depended largely upon the weather and the honey-flow—particularly those two things—and the man who is handling them.

Continued next week.)
right along with one-story ones, and the two-story hives have rousing big colonies when the June flow comes, plenty of honey and far more bees than the one-story ones. The big two-story colonies will be storing surplus when the other ones are barely started. This summer my large hive gave comfort to the Dadants, and I am sure that for outdoor wintering they are right, that the big hive is the better. I believe the net results to be better from such.

In producing comb honey it is true that a very large brood-comb chamber colony may get ready to downswarming before they do section-work, but this does not apply so much to extracted-honey stock where a set or two of combs above, ready to store in, attracts the bees to them.

Conditions that “locality” sometimes make a great difference. I call the reader to note carefully what I am just now to put before you, for these matters must be understood or you will say the doctors do not agree.

I have been for several years in a field in which the few weeks just preceding the June flow, were weeks of an absolute dearth of nectar. Now, reader, suppose you were here with your bees under such conditions. Suppose they were in 8-frame hives, and the last half of May and first half of June there was practically nothing for them in the fields, and the stores at home very low. Do you think you would have any swarming? Or even a proper amount of breeding? You would not need to bother your head about how to keep down swarming—I will guarantee no swarming-fever and no swarming.

Now, suppose your bees, instead of being in 8-frame hives, single story, were in two-story or 16-frame ones, stores to be in proportion, with a larger brood and other conditions favorable, you would have some swarming before the flow, and much more after it began. You could, by a careful and judicious management, handle your one-story hives so as to have good colonies, but it would have to be done in flow-watch and never at any time very anxious to get out of stores, and while they would have very little ahead make them handle what little they do have. One principal factor in inducing free laying by the queen, is to have hives full at the time.

Thus it is possible to have bees carried thru the spring in a dearth of nectar, bringing them up to a honey-flow in good condition and no swarming-fever. Such colonies will go into the sections and work for some time without swarming, many going thru a flow and not swarm if care is used to give and keep plenty of room in supers. But, should there be a little nectar from the fields for two or three weeks just before the flow, and at no time a scarcity of old stores, some would no doubt be ready to swarm at or about the beginning of the June flow.

Your two-story hives having a great abundance of two things (yes, three)—stores, empty comb and house-room—will breed just as rapidly under the complete-let-alone plan as will the other with the coaxing and encouragement. They will be ready for the next season for several reasons: 1st, because they go into winter with a host of bees, and can endure the cold, and so have more bees in in spring to start and care for brood; and 2d, because there is a plenty of feed at all times, both winter and spring. As before stated, I find my two-story hives build up faster in the spring, and make great rousing colonies by the time the others are in fair condition. I cannot account for it in any other way than the great amount of brood and bees in the fall being cared for by the bee-keeper and more rapid spring breeding from some cause; and a courage and ambition because of the much empty comb to occupy, and back by a rich store of honey.

Of course there is another probable reason—perhaps I should leave out the “probable.” When a colony is wintered in two chambers, that have been under conditions that find the brood and cluster low down or in the beeskin, they are bound to apply, have no place to go in winter and start breeding in the top hive in the spring. This leaves honey below the cluster in lower outer combs, and this they will from day to day carry up and store above and the bees act as a constant flow, which causes the workers to handle honey, have full succs, open stores and a well-fed queen and brood. It all conduces to the welfare and prosperity of the colony. It is a condition that is very like a flow of nectar, and is obtained with the same general care and the same la plus apiap.

Now I think I hear E. K. Root hurrahing for two-story 8-frame hives, and I think he is not far amiss as to the result to be obtained when they are rightly managed. If you winter bees outdoors, use a larger hive for the cellar.

If you produce extracted, use larger hives than for comb honey. If you use 8-frame hives, use two of them for a brood-chamber in very many cases; but you can contract if you choose, when the flow comes on.

Larimer Co., Colo.

**Flat-Bottomed Foundation—Securing Drones in the Fall.**

BY G. M. DOOLITTLE.

A correspondent writes thus: *"I have always used foundation having a natural septum or base, but I am thinking of using the flat-bottomed foundation next season. Will you please tell thru the columns of the American Bee Journal whether the flat-bottomed foundation before drawing it out? Or, after drawing it out, will they fill out the corners with wax, or let it remain with a flat base?"

Thus I have never leave the base of the cells as they come from the foundation-mill making foundation with flat-bottomed cells. This is one reason why there is never a base of yellow wax apparent with flat-bottomed foundation, where such is used in producing comb honey. With foundation having no natural base, the bees often, in times of an excessive honey-flow, add their own wax right on to the raised part of the foundation, so that this added part can be scraped off with the honey, the foundation washed, and the same perfectly clear and ready necessary in taking it bees. This gave rise to the “fish-bone center” in comb honey, complained of when comb foundation was first used in sections, and the flat-bottomed process of making foundation is invaluable to overcome this “fish-bone.” I am correctly informed.

When bees are given the flat-bottomed foundation, the first thing they do is to go to work to change the base, and in doing this the side-walls are manipulated also, but just how this work is accomplished I have never been able to tell, after all the close watching I have been enabled to do, for when the work is being done, the bee has his head in the cell, hence the vision of the would-be investigator is cut off, so long as the bee is at work.

While I prefer the flat-bottomed foundation to all other makes for section honey, it has two drawbacks, as I look at it, which are that this manipulation of the base of the cells takes time, so that sections filled with such foundation are not completed quite as quickly as is the case where the natural-shaped base is used; and where the sections are placed on the hive before the honey-flow is fully on, the bees will mischievously work at it far more than they will that with the natural base. As a result, when the honey-flow is what the honey-flow we expected does not come, so that it is necessary to look after the sections to see that they are all right when the bees are about to enter them to fill with honey, after a period of scarcity, or before putting them on for the next season.

I have had scores and hundreds of sections which were filled with this foundation, and which had been on the hives during a period of scarcity of honey, the foundation of which was eaten or gnawed away so that only a neck of foundation of from a quarter to a half an inch wide, remained next to the tops of the sections, while the lower half of the foundation was very nearly as it was when first put in. When honey commenced to come in the bees got to work on the foundation, it would twist about so that it would touch the separators, and be fastened there. And at the end of the season, when I expected to take off nice comb honey, the whole thing would be spoiled by the dust, and mud, and dirt left from the separators. This is the worst trouble I have with the flat-bottomed, and were it not for this, I would not think of using any other make in the sections. Of course, in good years this does not occur in years like the past has been, when fully ten percent of the sections have the foundation badly gnawed in them, it is quite an item.

For brood-frames, I can not see where the flat-bottomed has any advantage over that having the natural base, while it has, I think, disadvantages, and it is very important to use the foundation for the brood-frames.

**GETTING GRIMES FOR FALL QUEEN-REARING.**

Another correspondent writes thus: *"I wish to rear a few queens nearly every fall, but when I wish to do so, I find that the most or all of the drones have been killed off. Can I coax the queen to lay in drone-cub, if the same is..."*
placed in the middle of the brood-nest of a strong colony during the fall months.

Drones are the male eggs, which have puzzled many a queen-breeders, and while some say they can secure drone-eggs whenever they desire, the trying to rear drones after August 25th, by myself, in this locality, in an average season, produces me to think it would be quite an entire failure.

The only sure way that I know of, after trying nearly every experiment given, to have drones during September and October, is to mass what drone-brood (the drones from which are to our liking), can be found at the end of our summer honey-flow, placing the same in a large hive which will accommodate all that we may have, making the colony contained in this hive queenless, so they will keep these drones as long as you wish them, which they will do, provided no queen is allowed to hatch in the hive.

Drones do not live as large as you wish, you can make one of any proportions you may desire, by tiering one or more on top of each other. Worker brood must be given every ten days or two weeks, in order to keep up the strength of the colony, else they may be liable to be robbed when an entire scarcity comes in the fall. This hive must also contain a large amount of honey, as a hive having many drones in it grows light as to honey quite rapidly, and if, not properly fed, drones do not fly as freely as they should. As our beekeepers keep in bloom until August, the drones which are in the egg form, when the combs are mast, will not wear out because of old age before it will be too late to rear queens, say from the first to the tenth of October. We have had nectar in our hives live over, so as to fly quite plentifully on warm days in March and April, tho they are soon gone after the bees begin to have general flights.

After all other drones are killed off, if we wish to secure the very best results, this hive of drones can be exposed on some day when it is cloudy, and the mercury stands at from 55 to 60 degrees (at which temperature the drones are not likely to stampede off the combs), and all of the undersized and weakly drones can be removed, a full suit of combs can be almost sure that our queens will mate with the desired drones. This hand-picking of drones is quite a tedious job, but pays well where we have the object of the improvement of stock in view.

I have practiced the above plan for the past ten or twelve years, so I am not entirely ignorant in the matter, and am quite sure I have made much advancement as regards the quality of my bees by so doing.

Onondaga Co., N. Y.

No. 10.—Interesting Notes on European Travel.

BY C. P. DADANT.

T HE International congress of bee-keepers took place at Sept. 10, 11, and 12, 1900, on the Exposition grounds. Each of the delegates was provided, by the secretary, with a pass, for the duration of this congress, so they could go back and forth without having to pay any entrance to the grounds. The passes were called "service cards" as they were called, for I had been appointed delegate from Illinois to the Exposition, and about all the advantage I derived from it was the grant of two service cards, one for myself and one for my daughter, by the management of the American exhibition. The fee for entrance to the grounds was very low. It had originally been put at one franc (20 cents), but the issue of shares of stock had been suspended, and each person purchased his tickets, so that each purchaser of stock had the value of his stock in the Congress. In this manner, 65 million tickets had been issued, and as there were only 50 odd million of these used, the holders sold, in an eruption of their inferiority, have to fall. But it fell below reasonable prices. When we arrived in Chicago, the tickets were selling on the street at 7 cents, and when we came back to Paris, in August, they were at 6 cents (30 centimes).

Altogether, this International congress of bee-keepers was very interesting. I think more beneficial results have been achieved in many of our national meetings; but the most interesting feature to me was the opportunity of being among the leaders of science and practical bee-keeping that I have had. If I am not mistaken, there were 15 different nations, 24 foreign associations, and 35 French associations, represented. There were bee-keepers present from South America, Spain, Italy, Russia, Spain, Austria, Germany, of course, and 100,000 in England, and other countries. All but two or three of these men understood the French language, and all the discussions were in French, but the handling of different topics was placed in the hands of committees with foreign personnel, so that there was a juggling about by French languages, and it was quite interesting to notice the different accents of these men who occupied the chair in turn, and who, altho very familiar with French, still showed in their speech and elocution that it was a tongue foreign to them.

Having long known the energetic and amiable secretary of the congress, Mr. Caliaus, by reputation, I had paid him a visit a few days previously, at his home, to get permission to speak at the closing session of the congress, my credentials, written with a great eulogy, by Pres. Root of our National Association. He received me with the greatest cordiality, and when I offered to pay the membership fee, he accepted it, and all the foreign delegates were admitted as honorary members, free.

So much for French hospitality.

When I arrived at the congress hall, I was stopt at the door, the regulations, and I was told that I do not have a foreign passport, and was not permitted to enter. I rather felt then to criticise the French love for rules and regulations, which is so conspicuous, not only in France, but throughout Europe. But they took the pains to explain to me that I must register, which seemed to me rather vexations, was the only method that could be used of compelling members to help sustain the institution by paying their membership fee. Otherwise, they said, a number of those who could not possibly pay the membership fee, nor even would, and even discuss and vote, and would go home without having subscribed as much as a single cent towards defraying the expenses incurred. I could not help thinking that this was a good lesson for our leading bee keepers in the United States to deplore the fact that there were bee-keepers at each congress who took advantage of the meetings without helping their success in a pecuniary way. By compelling foreigners without expense to them, we must expect our local men to help us, and a bee-keeper who thinks enough of a congress of this kind to travel a number of miles purposely to attend it, ought to be willing to help defray some costs.

The number of delegates present must have been 150 or more, I have not yet received the report of the secretary, so have none of the proceedings to refer to, and can only speak of what I recall to memory. I was appointed by the number of doctors, teachers, and clergymen, whom I met. It seems to me that they must have composed fully a third of the attendance. The peculiar clothing of the Frenchmen make them much more conspicuous than our Protestant ministers. But a pleasant sort of men I never met.

Among the subjects toucht in the discussions, I will mention the "Role of the drones in the hive," and the "Olive opinion of the destructive work of drones," and the destruction of drone-comb and replacing of these by worker-combs, in inferior combs. Was desirable, for a motion to recommend this was past, but there was considerable opposition. One member came with a report showing that he had experimented on two hives, the one with many drones, the other with few. I will quote a part of his report:

In a hive I obtained many drones by placing in it, in the spring, some drone-combs already built and some unframed frames with guide, in which, as you all know, the bees would build more drones than worker combs. In another hive I placed comb built with worker-cells, so as to have but few drones. The definitive gain of the hive with drone-combs in which I worked was about a pound, on the other hand, I weighed five hives with many drones, and five hives with few drones. The five hives with many drones increased 116 kilograms. The five hives with few drones increased 125 kilograms.

This shows a difference of seven kilograms, or 16 pounds, in favor of the hives with few or no drones. But this gentleman does not think that this difference is sufficient to condemn the drones, and thinks they are advantageous in keeping the brood warm. He did not stop to note that before these drones took the bee-comb, they had to be kept warm themselves while in brood, and that, too, at a time when the bees are not numerous and the weather is cooler than during the honey crop; and that if there had been workers reared instead of drones, they would have been likely to get the same cold to the bees at that time, as it is well known that they will not harm if the weather became cold enough to necessitate this.

But one thing I heard asserted by a number, and which I entirely disbelieve, is that the bees change worker-comb to drone-comb, when all the worker-combs are full. This is not the case. I do not mean to contradict any one, but I believe that the asserted change from worker to drone com was not the
work of the bees, but a sagging of the cells in combs of foundation caused by heat. I have seen this in a few instances. But in order to convince me that the bees actually tore down worker-comb to rebuild drone-comb in its place, it would be necessary that the test be made with old worker-comb, in which there could be no prospect of sagging.

But I am running away from my task as narrator and falling into arguments.

Another subject, which is of great interest to the world over, is that of foul-brood, and it appeared to me that, in Europe as well as in America, many so-called cases of foul-brood are only accidental cases of chilled brood. I say this because I was told by a French bee-keeper that he had had foul brood among his bees, but it had disappeared without his having to do anything for it. And two or three bee-keepers got up in the meeting and asserted that foul-brood was not so dangerous a disease as had been reported to be, and one man ridiculed all the writers who advise such strong measures against it, but the interruptions and laughing of the majority showed him that he had no hope of convincing them. Several leading men, on the other hand, advised fire and boiling water as the only sure remedies for the true foul-brood, which is evidently a scourge the world over.

Another subject, which has perhaps more importance for the European than it has for us, was the creating of apiarian classes in schools and colleges. I say that is has more importance over there, because so great a proportion of the population does not seek information, as our farmers do here, thru the daily papers and agricultural press. But it has importance for us, nevertheless, for it would be useful to have, not only our bee-keepers, but all classes, informed, superficially at least, upon the natural history of the honey-bee, its role in nature, and the need of its cultivation.

I had an occasion of ascertaining the total ignorance of some of our average American citizens on this subject, during our return trip to America, on shipboard. To pass away idle hours, the passengers got up an evening entertainment at which each one was required to say, or sing, something for the entertainment of the others, under penalty of the payment of $1.00 into the sailors' orphans' fund, and they had me down on the program for a talk on bees. I did the best I could, and the few words that I spoke led to more questions than I could have answered in a week, and some of these questions were decidedly foolish.

Mr. Editor, I hope you will excuse me, but it seems I cannot avoid tumbling out of my subject. I was quietly taking notes among bee-keepers, at Paris, and here I am, on the ocean, sailing home before time.

This questions of teaching bee-culture is fast being solved everywhere. When I visited the old city of my birth — and I may tell you something about this by and by — I entered the doors of the old college in company with the treasurer of the college, who was also entrusted with a school of apiculture in this institution, and on his desk I found a French copy of "The Hive and Honey." It seems that everywhere they are trying to push the education of the peasants on all agricultural subjects. This is sure to bring results sooner or later.

A Summer of Bee-Keeping in Nevada—Alfalfa.

By J. T. Hammersmark.

It was on a dark, dismal evening in June that I stept off a train in the cozy little city of Reno, situated in the mountains a few miles east of the border-line of California. Altho we are in mountains, so to speak, still we are in a valley 10 by 15 miles, entirely surrounded by mountains. This and some of the neighboring valleys are very fertile, where water is to be had, but where it is lacking sage-brush and jack rabbits hold the fort. Some few scattering scrub pine trees are to be seen on the mountains. This is all that is left of what used to be a great forest some years ago. The valley is well populated with thrifty and well-to-do ranchers, cattle and sheep men, and bee-keepers. It is about the latter class and their industry that I will give a short sketch.

The bee-keeper's calendar here is just the same as in the Eastern States. We begin our work about the 1st of April and finish up about Oct. 1st, or as soon thereafter as possible. We are not troubled here with the wintering problem, as bees winter well on the summer stands. A great deal of alfalfa is grown here. Two crops of hay are cut each season from this source and the third crop is sold for fall pasture to men who turn their herds on these fields, which are in a few days grazed to the ground. Our source of honey is alfalfa. It is a very prolific yielder when the conditions are just right. It is something like white clover and basswood in regard to the amount of nectar it secretes; some years it yields more nectar than others, but it is not so subject to short and uncertain crops as the above-mentioned, and many other nectar-yielding plants of the East. One is always sure of a crop altho it may not be more than 40 to 50 pounds per colony some seasons. The average yield for 20 years, I feel safe to say, would not be less than 100 pounds per colony of comb honey. This is judging from past records.

The past season Mr. Hash's crop was 30,000 pounds of comb and extracted honey, being the smallest yield per colony he has had in 20 years, and this was an average of 50 pounds per colony. Some people have asked me since my return to Chicago, if their alfalfa honey is of good flavor. To this I say, yes. The alfalfa honey of this region is preferred to that of California by buyers. In my estimation it comes next to pure white clover honey, if I have any preference at all.

But we have our troubles here, even if we get lots of the best honey produced. Think of a ride on the cars from Chicago, for instance, from three to four days, first thru our fertile neighboring States, then over the vast desert of waste land and mountains of the far West. However, this would not be so bad if the railroad company did not charge you a small fortune to get there. Then, our freight charges are something awful. Suppose I order a carload of bee-fixtures from the East to be laid down in Reno, Nev. My goods go no further than Reno, but the company wants me with freight to San Francisco, and back freight again to Reno. Of course, they are the big fish and I am of the little fish and during the present state of political corruption, as long as the men who make our
laws can be bought and bribed to do as the big fish dictate, regardless of the rights of the people, the little fish must either submit to their robbery and be swallowed alive, or keep out of their way. There are hopes, however, that such things will some day be modified, for the people will not always be silent. Pardon me for switching off on politics, for I intended to write about bees, but you see it naturally came into the subject of our drawbacks in the West, and as this is my view of the matter, if I should not speak of it for fear of offending some one I would not be doing right.

Then, to be isolated in a new country, away from all one's friends, is another thing you have to contend with if you care for society, but if you could make friends in the East you can do so in the West. The climate of this high altitude is simply fine. Reno is 4479 feet above sea-level. Snow can be seen on the tops of the highest mountains nearly all the year round. Bee-keepers at Reno are now suffering from the fact that the place is overstocked with bees, for there are many fine locations in the West, especially if a man has two or three thousand dollars to buy out a well-started place—a man with $400 or $500 could get a good start, but of course he would have to depend on other in-

come aside from his bees for a few years until his stock in-
crease to from 500 to 500 colonies, at which time he could de-
pend on making a good living, and most likely accumulate a
nice little bank account from the product of his bees be-
sides.

There is another thing I have not mentioned: Alfalfa, I am sorry to say, is cut in its best bloom for honey. I no-
ticed that the bees did not, the past season at least, work
more than 7 or 8 days on each crop before it was cut. It is
of the sweet clover order. It commences to bloom about July
1st, and will bloom another 10 weeks or more if not cut.
What a lot of sweet could be produced from 1,000 acres of Alfalfa raised for seed!

Taking it carefully into consideration, it is a question whether one can live on alfalfa with the bees.

I have given a fair view of both sides of the question, so no one will be misled, I hope, thru the reading of this ar-
icle. Cook Co., Ill.

P. S.—Referring to the picture of the apiary, I may say
that one afternoon a traveling photographer came by our
place, and those seen in the photograph came out and lookt
towards the camera while the man pressed the button. Mr. Has-
hemia was away: I am sorry he was not at home for with his presence the picture would have been complete.
The sun was just going down over the Sunset mountains, which we stood facing; that's why we are all squinting so
admirably.

The young lady with the white waist is Mr. Hash's
niece, who helps him at times during the honey season. The
lady at the left in the picture is Mrs. Guthrie, who

came out to cook for us for a few weeks. Her daughter and
son are the one who will be there right away, and Mr. Guthrie is himself—myself. Miss Guthrie has helpt Mr. Hash in the
bee-business for the past three seasons. She is a splendid
"hand" and can scrape sections like a machine—so fast and

clean.

J. T. H.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller
direct, who will answer them and then ask the
Doctor to send answers by mail.—EDITOR.)

Moving Bees on the Cars.

I have been thinking of moving to Colorado. Could I

take bees that distance—900 miles? If so, how should I pack them to move on the train? Can I make the change, say the latter part of February?

NEBRASKA.

ANSWER.—In moving bees on the cars the two things to

fear are the breaking of the combs and the smothering of

the bees. There ought to be little danger as to the last in

the month of February. See that each colony is well cov-

erted at the entrance or elsewhere a space covered with

wire-cloth equivalent to 10 or 12 inches. If the frames are

fixed-distance frames they are all right, but if they are loose-

hanging frames, fasten them in place either by driving a

nail partially into the end of each top-bar, or by putting in

little sticks between the frames. Fasten the hives in the

cars so they can not move about, and let the frames run

parallel with the rails of the railroad. The excitement of

the journey will be a little hard for the bees in February, and

will make them eat more than they otherwise would, so

they will need a flight sooner than if they had been left in

quiet.

Transferring and Dividing Bees.

Suppose we have a colony of hybrid bees in a hive not

standard, but full of comb and brood. We can transfer

those old combs, but will have to tie or wire them in our new frames. Now, we have eight new hives in the

foundation; and we have coming in the spring—say the

first of May—one strong colony of pure Italian bees without a

hive, one queen in April, and two more in May and June.

We want to increase all we can, and have way more stock

colonies in the fall. If we had our colony in an improved hive next

spring, full of bees, comb, and brood, we would know how to

proceed, but if we transfer them we can't expect much

increase.

Don't you think it would do to transfer the bees (as they are hybrids) into a new hive, then put the queen that is

coming in April into the old hive, then put the colony that we are going to send for, in a hive with full sheets of foun-

dation? Then how are we to get drones to breed from next

summer? I do not know whether our old queen is a hybrid,

or a daughter of a hybrid.

You might infer from the tone of our letter that we are

running this bee-business alone, but we are not wishing to

mislead you in the least. We have a good papa who helps

us, or rather we help him, but the bees belong to us.

TWO WASHINGTON GIRLS.

ANSWER.—You are mistaken in thinking that transfer-

fing will make any great difference in the matter of in-

crease. In the present case it is merely transferring from

one set of frames to another, and you can have the brood

just as compact after transferring as before, in which case

the bees will go right on as if there had been no trans-

ferring. If I understand you rightly, your plan contem-

plates dividing your old colony in April and forming a new

colony to which you will give the queen received. It is very
doubtful that your colony will be strong enough to divide

in April to bear any depliction. The first thing is to have

it build up good and strong, and if you take anything from

it before that time you will lose by it. You can transfer in

fruit-bloom without any loss, but unless the colony is very

strong don't divide at that time.
As the colony of Italians you are to get will be without hives, it will be necessary for you to have a good plan to have the transferring done before you receive the Italian bees, and then you can give the Italians the larger share of the brood in the old colony. That will make at first a mixt lot of workers in the colony with the Italian queen, but that will be no harm. A week after any queen reared from brood taken from the Italian queen will be of the right stock. Having now the two colonies to draw from, you can form new colonies by taking a frame of brood and bees from each when you want to start a new colony.

By keeping the Italian colony strong, you will be sure to have drones therefrom. When you give brood from the old colony to the Italian, see that you take combs that have some drone-comb in them, but if any drone-comb is in them at the time destroy the slats by shaking off the heads of the sealed brood and sprinkling fine salt on the unsealed.

Transferring Bees.

1. Which would be the best month or time to transfer bees from common, rough redwood boxes to regular hives?
2. Is it not a rare thing for a few bees (I could not see more than 10 bees), at about 4 p.m., and about half a mile from the seashore, to commence building a comb on the edge of the same redwood box (a bed four years old, the brand being only about two or three feet from the ground)? I could see no other bees but the few workers I mentioned. I was looking at them about ten minutes.
3. I would like to know if it is possible to hive the above bees, and also, how and when to do it. Also, suppose they were hived, would you put the hive on the ground in the same place or not?

Answers.—1. Probably 21 days after casting a swarm. If you prefer it earlier, take the time when the combs are as light as possible and bees working at the same time. In the North this comes at the time of apple bloom.
2. Decidedly a rare thing for so small a number as 10 bees to be engaged in comb-building anywhere. Are you sure they were not carrying away wax that had been left there by a swarm that had been clustering there? Sometimes it happens that a swarm starts to build comb on a limb, then leaves, and a few stray bees get left.

3. It is doubtful if you could hive 10 bees and get them to stay, and they wouldn’t be of any value should you succeed.

CAGING AND MAILING QUEEN-BEES.

Forty bees in a very big cage, with both cold-wetheroom and hot-wetheroom—the way Doolittle sends queens to the Boers. If he would only contrive some way to send them, there is another brother (as green and innocent) who would crown him “king of men.” Sixty-five degrees of temperature for your caged queens, whenever you can boss the thermometer. Most of us would have jumped conclusions for a much higher temperature, and Mr. Doolittle deserves many thanks for a valuation of his bees. Also, who has no experience in caging queens during harvest are glad to be assured that the bees can be depended upon to feed them. Page 742.

NECTAR AND CANE-SUGAR.

It seems to me that Editor Cowan, on page 758, makes a little slip where he says that the sweet of nectar is “almost entirely” cane-sugar. Unless my memory is greatly astray, we had, not many years ago, the exact determination of the different kinds of sugars in several samples of nectar produced by scientific hands and gathered artificially. One or more of the samples showed more than half cane-sugar, but most of them less than half—composition varying greatly according to the species of plant the nectar came from.

ACID TO PREVENT GRANULATION.

I should have used over so much excess of acid if I had been asked to make bee-feed with vinegar to prevent granulation. I make a note. Tablespoonful will do for 10 pounds of sugar, if the vinegar is sharp. Page 751.

INTERNECINE WAR ABOUT PURE FOOD.

Mr. Abbott’s speech is quite a refreshing change from the formal tone of the ordinary convention paper. And so there’s internece war between friend and friend among the friends of pure-food legislation. Sad. And all because the butter-folks are set in the resolution to subject imitation butter to additional disabilities, beyond being said under its own name—disabilities more or less inquisitorial. Stated in that way, it sounds as if the Brosius folks are altogether right and the others altogether wrong. But no justice will be done by staling the other side. I suppose the other chaps will say that people are fooled with bogus butter more frequently than in almost any other way—and more to their disgust; that the person who eats butter is of a disposition not permitting the present methods inform the buyer what he buys, but not the eater what he eats; and that therefore it is right to protect the eater by forbidding the imitation to be colored like the genuine. That sounds quite fair, too, but when you add that under infant industry honesty infantile altho the industry is not seeing that no one will eat as a relish a new stuff that looks queer, but the boy that must have absolutely all the candy he calls for, else the prop will all the candy designed for that class will be wasted, I feel the most kindly friend of naughty boys would find it hard to say anything mitigatory for him. Page 753—5.

The “Old Reliable” seen thru New and Unreliable Glasses.

By E. E. HASTY, Richards, Ohio.

FRENCH ANTI-PROGRESS—BEES AND PLANTS.

I think most of us were interested in reading how, for the French-speaking portion of the world, the anti-progressive monster intrenched in the columns of the only French bee journal was bought and conquered by Messrs. Dadant and Bertrand. We are glad Mr. Bertrand has the beautiful home we read of, looking out upon its beautiful scene. Rather in the nature of news that Mr. Blanc is of three different colors at three different times of the day.

Yes, now editor Bertrand calls our attention to it, it is getting apparent that plants (for their own look-out-for number one profit) have three ways of securing the attendance of bees—nectar, pollen, and more or less mysterious dainties, very small in bulk, and of which the bee never gets a load to carry home. (This doesn’t prove that the bee never carries home any of these minute secretions.) Mr. Bertrand’s experiment of making a bee at work on his “bar-room plant,” and watching it for five hours consecutively, and noting that the little dupe had nothing to show for its work at the end of the time—that experiment deserves a great deal more attention than it has received hitherto. All of us who pay any scientific attention to forage plants need to be on the lookout. I feel pretty sure that poppies, altho they may furnish some of both pollen and nectar, furnish something else also, and that it is this "something else" that gets the bees so excited. And I wonder a little if the American garden club is not another of the same thing. I had never heard before that the Chapman honey-plant was of this character. It seems Mr. Bertrand had discovered that before its home in this country. I fear we will find that "all plants that attract bees are of this kind, and that all plants furnishing large amounts of nectar have occasional times of barrenness when bees ignore them. Don’t let any one tell the man who wastes his time hovering around our horrible Eryngium that this most of model of industry, the bee, does the same thing.

Do we understand that it was an American plant that scored in Mr. Bertrand’s garden the record of rapid growth—an old hop vine, that would have been saying that Mr. Dadant writes nice travel letters with the bees left out, they must admit that he has redefined himself this time. Page 761.

ACID TO PREVENT GRANULATION.

I should have used over so much excess of acid if I had been asked to make bee-feed with vinegar to prevent granulation. I make a note. Tablespoonful will do for 10 pounds of sugar, if the vinegar is sharp. Page 751.

INTERNECINE WAR ABOUT PURE FOOD.

Mr. Abbott’s speech is quite a refreshing change from the formal tone of the ordinary convention paper. And so there’s internecine war between friend and friend among the friends of pure-food legislation. Sad. And all because the butter-folks are set in the resolution to subject imitation butter to additional disabilities, beyond being said under its own name—disabilities more or less inquisitorial. Stated in that way, it sounds as if the Brosius folks are altogether right and the others altogether wrong. But no justice will be done by staling the other side. I suppose the other chaps will say that people are fooled with bogus butter more frequently than in almost any other way—and more to their disgust; that the person who eats butter is of a disposition not permitting the present methods inform the buyer what he buys, but not the eater what he eats; and that therefore it is right to protect the eater by forbidding the imitation to be colored like the genuine. That sounds quite fair, too, but when you add that under infant industry honesty infantile altho the industry is not seeing that no one will eat as a relish a new stuff that looks queer, but the boy that must have absolutely all the candy he calls for, else the prop will all the candy designed for that class will be wasted, I feel the most kindly friend of naughty boys would find it hard to say anything mitigatory for him. Page 753—5.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy card and mounted on heavy card and posterboard. It is a picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.
Best Honey Season in Years.

The past honey season has been the best we have had for years in western Massachusetts. I secured 153 pounds per colony, and the quality cannot be excelled.

I much regret the almost total failure of the honey crop in many sections of the country, as reported in the Bee Journal, but I trust that we all realize that there are ups and downs in the bee-keeping business as in all other occupations in life, yet if we persevere reward will surely come.

Jos. Blake

Report for the Past Season.

I have 9 colonies of bees in winter quarters. I wintered out one colony, and now they are settled, and secured no increase, but they stored 35 pounds of nice section honey, which I sold for 15 cents per pound.

H. J. Cooley
Kane Co., Ill., Dec. 19.

Bees Didn’t Do Very Well.

My bees didn’t do very well this season. They were wintered in a cold, damp cellar, the temperature sometimes going down to 10 degrees below the freezing point, so they were very weak in the spring.

I secured only 500 pounds of comb honey from 10 colonies, spring crop, and increased to 15. I use nothing but the tall sections of 4×5×56,”—with separators. Honey sells more readily in them, and I can get a better price for it.

Will Enlert
Wood Co., Wis., Dec. 20.

Poor Season for Honey.

This has been a poor season for honey in this locality, on account of the dry weather in May and June, but I feel that I can not get along without the American Bee Journal.

Lewis Lloyd, Jr.
Columbia Co., Wis., Dec. 18.

Cotton Honey—Swarming.

I notice on page 76 (1910) a report headed “Cotton as a Honey-Plant.” In answer to R. P. Davis’ letter on page 78. Mr. Carr says he doesn’t think that cotton is anything extra as a honey plant, but that we have a variety of prairie-flowers which are our main source for surplus honey. He may leave Lamar county out when it comes to prairie-flowers. When cotton fails to yield nectar the bee-keepers of this part of the state wear a long face. I extracted 760 pounds of cotton honey secured from 11 colonies, spring crop, and increased to 25. Davis is mistaken about the bees gathering surplus from the cotton bloom. They get the nectar from the middle stem of the leaf, and from the square and bolts they get pollen. They do some honey from the bloom.

On page 77 is an article headed, “Do Bees Select their Future Home Before Swarming?” In my opinion this question will never be settled, so I believe I should take the nectar and pollinate plants with the results of the bee tests. I shall take the nectar and pollinate plants with the results of the bee tests.
SPECIAL NOTICE!

Last winter's cut of basswood is the whitest it has been for many seasons. We are now making sections of this new stock and therefore are in a position to furnish you with the very finest quality in the market.

LEWIS WHITE-POLISHED SECTIONS

Are perfect in workmanship and color. Orders should be made immediately. We will ship immediately upon receipt. A complete line of everything needed in the apiary. Five different styles of Bee-Hives. Lewis Foundation Fastener simplest and best machine for the purpose. Price, ONE DOLLAR, without Lamp.

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sickness, Headache, Insomnia, “the Blues,” and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for “Health” booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin FREE!

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

If, instead of sending for a sample, you send us 25c we will send you “Health” booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.
The Novelty Pocket-Knife.

Your Name and Address on one side—Three lines on the other side.

HOWARD M. MELBEE, HONEYVILLE, Ia.

(THE KNIFE IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the knife.

The Novelty Knife is a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass: the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty Knife is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelty Knives, your Pocket Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this useful knife, as the Novelty Knife must be seen to be appreciated.

How to Get This Valuable Knife.—We send it post paid for $1.25, or give it as a Premium to the one sending us one new subscriber to the Bee Journal (with $2.00). We will club the Novelty Knife and the Bee Journal for one year, both for $1.50.

* * * “Please allow about two weeks for your knife order to be filled.

To Exchange—Bates & Edsmonds 1½ and 3 pipe carbon engines. Wanted: foot-power saws, lathes and machinery of all kinds.

ROBERT B. GEDEE, La Salle, Ill.

1A21 Mention the American Bee Journal.

Machinery FOR SALE.—Tensol machine, Ford-ite admirable machine, two-spindle shaper, saws—Ehle, grooves and saws, shafting, pulleys and belting. FRED DALTON, Walker, Mo.

1A24 Please mention the Bee Journal.

The Ohio Farmer

AND THE

American Bee Journal,

Both One Year for only $1.40.

THE OHIO FARMER is clearly one of the leaders of the agricultural papers of this country. It is a 20-page weekly, often 24 pages, handsomely printed on good paper, and CLEAN in both reading and advertising columns. It has the largest actual staff of editors and correspondents (all farmers) of any farm paper published, and is practically progressive in defending the farmer's interests.

IT WILL HELP YOU MAKE "THE FARM PAY." Send to Ohio Farmer, Cleveland, Ohio, for a free sample copy.

REMEMBER, we send both the Ohio Farmer and the American Bee Journal, both one year for only $1.40. Address,

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.

20 cents Cash ★ ★ This is a good time to send in your Beeswax. We are paying 26 cents a pound—CASH—for best yellow, upon its receipt, or 28 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
AMERICAN BEE JOURNAL

Jan. 3, 1901.

supply our own table, besides selling $38.00 worth, thus keeping our "toot-hide" replenished to the extent of another year's subscription to the American Bee Journal. As long as the editor keeps the "Old Reliable" up to its present standard, we won't kick. We wish to add a larger number of new subscribers, and a merry Christmas.

M. P. LOWTY.

[Thank you, Mr. Lowty, for your good wishes—yes, and the same to so many other good friends who have sent us numberless kind words of encouragement. —Editor.]

Good Instruments.

Don't confuse these instruments with cheaply "bargain hunter" offerings. They are highly accurate, guaranteed, instruments. For WARTS.

VIOLIN.—Small model, choice of 3 strings, fine, $1.25; $2.00, light, regular, $1.50. Steel strings, $1.00. Full feathered bamboo canary, extra set of strings, $2.00. $3.00, 3.

My Price $1.25.

QUALITY VIOLIN.—Solid wood, nicely finished, Spun corderoy, full feathered bamboo canary, extra set of strings, $3.00. My Price $4.00.

My Price $1.25.

My Price $1.25.

Piano.—Consists of a redwood fingerboard, varnished finished, $1.00. My Price $1.25.

My Price $1.25.

Langstroth on...

The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, with large, practical bee-keepers, so well known to all the readers of the American Bee Journal—Chas. Dadant & Son. Some errors are stated to have been clearly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for $2.15, or club it with the American Bee Journal for one year—both for $1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with $3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Please mention Bee Journal when writing.

Sections—A Bargain.

We have 10,000 ¾ x 5½ x 1½ inch plain sections, and as our call for them is light, we will sacrifice them. Prices very low. Write.

Apliances—Glen Cove, L.I., I. J. STRINGHAM, 105 Park Place, New York, N. Y.
Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of these buttons to attract people to ask questions about the honeybee and, by a conversation that started would wind up with the sale of more or less honey at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cents; 2 buttons, 6 cents each; 5 or more, 5 cents each. (Stamps taken.)

Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
Mr. C. P. Dadant and Daughter Among the Swiss Bee-Keepers.
The Bee-Keeper's Guide
Or, Manual of the Apiary,

By Prof. A. J. Cook.

460 Pages—16th (1899) Edition—18th Thousand—$1.25 postpaid.

A description of the book here is quite necessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without The Bee-Keeper's Guide.

This latest and edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to present subscribers only, and no premium is also given to the new subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal with $2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for $1.25, or we club it with the Bee Journal for a year—both for only $1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it. Will you have one?

GEORGE W. YORK & CO.,
118 Michigan Street,
CHICAGO, ILL.

Yellow or White
Sweet Clover Seed
Free as a Premium
For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us $1 with a new name for next year (1901), we will send the new subscriber the balance of this year's (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey clover. Better send two new subscribers (with $2.00) and get the three pounds of seed.

Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.

Best
Extracted Honey For Sale

All in 60-pound tin cans.

Alfalfa Honey......
This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough the Alfalfa extracted.

Basswood Honey......
This is the well-known light-colored honey gathered from the rich, nectar-laden Basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:
A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for packaging and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxy. This is all absolutely pure bees' honey, the finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:
I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.
We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.
Editorial Comments.

A Big Fire—Our Office and Stock Flooded.

On New Year’s day the office and floor occupied by the American Bee Journal, bee-supplies and honey business, was made almost a complete wreck by floods of water coming down from the upper floors where a big fire broke out about two o’clock in the afternoon. There were something like 20 fire-engines throwing water thru and on the top of the building in an endeavor to put out the fire, and of course practically all of that water came down thru our floor.

Fortunately the issue of the Bee Journal for mailing on Wednesday, Jan. 24, was still in the office of the printer, and thus was saved, as were also the forms from which it was printed. Thru the kindness of one of our former partners we were able to mail the Bee Journal in his office, thus preventing any delay in getting that number off.

We are writing this Thursday evening, Jan. 3d, and are not sure but that this number of the Bee Journal may be delayed. If it is, it will likely be the first time in 20 years, on the publishers’ account, that it has failed to be placed in the Chicago post-office on time. Also, it may be that we will be unable to get out more than 8 pages instead of the 16. If so, we feel very certain that bee-keepers will not complain, knowing that in case of a fire no firm can do exactly as they would under other circumstances.

We do not know just yet what our loss will be on printing-office, bee-supplies, and honey, but feel very sure that it will be sufficiently large. Of course, we had everything fairly well insured, but as all know who have had experience with insurance companies, it will be understood that there is no likelihood of getting the full amount of the loss. This misfortune comes at a time when it is not easily borne by the publishers of the American Bee Journal, so that we would like to suggest that all who are owing on their subscriptions please send it, and also a renewal for 1901. While the loss on account of the fire will be a good deal, it of course will not interfere with the continuation of the Bee Journal. However, everything sent in on arrearages, renewals, and new subscriptions, will be gratefully received at this time.

The fire in our building was one of the fiercest that the fire companies of Chicago have had to fight in a long time, and the weather being extremely cold on New Year’s day, it was really very remarkable that the building and contents were not totally consumed. The daily papers spoke in high commendation of the excellent work done by the Chicago fire department. To prevent the total destruction of a 7-story building, 100 feet square, when a great fire is raging at its top, is certainly a wonder. The Chicago fire department did it, and deserve great praise for their bravery and success.

If any of our readers or customers do not receive prompt response to their letters or orders they will now understand the reason for the delay. Just as soon as the insurance companies have adjusted the losses, we expect to get things in shape so as to be running again as usual. This may take a week or two for the bee-supplies and honey business, but we expect to be able to have our printing office in running shape again by the end of this week.

The total loss occasioned by fire and water, on building and contents, will likely be anywhere from $50,000 to $100,000. There were perhaps ten firms in the building, and all suffered more or less loss.

George W. York & Co.

Bulk or Chunk Honey—that is, comb honey filled in tin cans, and the empty space filled up with extracted honey—has been highly recommended by some bee-keepers, especially in the southwest, but according to E. T. Flanagan, in the Bee-Keepers’ Review, it is not wise to put up honey in that form. He seems to think it will be better to keep the two kinds separate, either kind alone bringing more than the two mixed. With such diametrically opposite views it is hard to tell just what to believe, unless it be that local preferences may have a bearing. As a bit of experience in the matter, Mr. Flanagan says:

Some years ago, having sold all my own crop of comb honey, I went to St. Louis to get a supply. At one of the largest commission houses in the city, where, I frequently dealt, I inquired if they had any comb honey on hand. “Yes, a very fine article; come and take a look at it,” I did, and found over 100 cases containing 120 pounds to the case. I supposed the one showing me the honey had made a mistake, for I thought the cases contained extracted honey, but I found the 120-pound cases filled with as fine comb honey as I ever saw, but in 60-pound cans. I asked the price, and was more than surprised to find it only 50 cents a pound, when I had come prepared to pay from 12½ to 14 cents for good section honey. I asked them to remove a portion that I might examine it more closely, but it was impossible to do so without breaking and tearing it all to pieces. Of course, I did not buy a pound of that honey, for I could not use it. I could not sell it to my customers for as much as clear extracted honey. Now, that was A No. 1 comb honey originally, and it would have brought 15 cents per pound at wholesale readily had it been in sections. I was there to give that much for as much of it as I needed, but I would not give the fire cents per pound that they subsequently offered it to me for, and I believe they sold it later for 4½ cents per pound. How much the poor fellow netted on that fine lot of “chunk” honey I leave you to figure out; I only know I was sorry for him, and glad I was not in his place.

Building Up Weak Colonies for the honey-flow is not advisable in many cases. If it be done at the expense of colonies only fairly strong in a region where the honey-flow closes rather early in the season, it will be at a loss, and a reversal of the practice would be advisable, that is, drawing from the weak to help the strong. But where the season is sufficiently long—possibly in any case where colo-

nies become very strong—it is possible that the very strong may be made to help the weak so that the total harvest may become increased. With regard to weak colonies, Wm. McEvoy has struck a new thought, which he gives in the Canadian Bee Journal. He says that larvae in weak colonies are not fed as well as they should be—a thing not so hard to believe by those who are familiar with the fact that larvae are not always fed alike. So he has thought out a plan by which he kills two birds with one stone—he secures the feeding of a part of the larvae in strong colonies that left to themselves would have been fed in the weaklings, and at the same time gets the weak ones strengthened. Here is his plan:

Just as soon as the strongest colonies are in shape to put the combs out, I lift up a comb full of brood that is about ready to be capped, and place it above the queen-excluder, and leave it there for nine days. I do this with every strong colony.

During the nine days the bees in these strong colonies will feed the larvae extra well, and all that was in the egg form when I placed the combs above the queen-excluder will be capped brood at the close. At the end of nine days I take all the combs out of the brood-chambers of these weak colonies and fill the brood-chamber with capped brood from these top stories, and in a few days after this is done the capped brood will be hatchet out, and these weak colonies will be full of bees.

The combs that I take out of the brood-chambers of the weak colonies I put in the top stories where I took the capped brood out of, and let them have that in place of the brood I took from them. The bees in the strong colonies feed the larvae given them from the weak colonies well as before.

Locating and Starting an Apiary.—Mr. G. M. Doolittle works up some very interesting and profitable apiarian conversations with himself in each number of Gleanings in Bee-Culture. In the issue of Dec. 1st, it happens to be about locating and starting an apiary. His responses to questions may be summed up something like this:

Unless a prospective bee-keeper has some knowledge of the business, 25 colonies would be too many to start with. He recommends reading one or two of the standard bee-books, and the taking of one or more of the best bee-papers. So much for necessary literature on the subject.

As to placing hives, Mr. Doolittle would have them level from side to side, and slanting just a little toward the front, providing the frames run the usual way of the hive—from front to rear. If the frames run from side to side, then the hive should stand level both ways.

Mr. Doolittle recommends placing the hives three inches from the ground—to prevent the bottom-board from warping, and also to give the bees a better chance to get in on cool, windy days in early spring, thus preventing loss of bees at a time when one is of more value than a hundred afterwards.

On the nearness hives should be together, Mr. Doolittle says his apiary is laid out on the hexagonal plan, the hives being ten feet apart in the rows from center to center, and the rows ten feet apart. This is how he would proceed to arrange the hives, supposing, as suggested by the apiary finally to contain 100 colonies:

"To get the hives arranged in the hexagonal form, get a line 100 feet long, having a pointed stake tied on each end. Five feet from the stake at one end tie to the line a white thread or string, four or five inches long. Five feet from this white thread, tie a red thread or string, and likewise five feet from the red, and so on until you have red and white threads alternating at five feet from each other the whole length of the line.

"The line is to be stretched where you wish the first row of ten hives to stand, then you are to stick a little stake at every white thread. Now move the line ahead ten feet, when you will stick the little stakes at the red threads. Then move ahead ten feet again, sticking the stakes at the white threads, and so on until you have stuck the 100 stakes for the stands for your 100 hives or colonies you expect to have in time. Having your stakes all stuck, level off the ground about each stake until you have a nice broad level, and then ready to put your hives on them any time. Having it completed, and each stand occupied with a hive of bees, if you are like me you will consider that for convenience and beautiful appearance this plan is superior to any other."

On the facing of the hives, he prefers to have them toward the south, so some of the best bee-keepers in New York State advise southeast, for then the morning sun will cause the bees to gather earlier in the day. He comes out very strong against facing hives to the north in a cold latitude.

Next—A Machine For Uncapping Honey, BY "OLD GRIMES."

THERE seems to be some stir in the busy world of bee-keepers, and the ingenious fellows are determined to place obstacles in the path that has been beaten by us old fellows. We must needs use them, stumble over them, or make new paths around them.

Just now the uncapping-machine is rocking the brains of these geniuses and Old Grimes wants to have his say about the matter. Off and on for a number of years I have wielded the Bingham knife, and quite successfully too, and I expect still to wield it for an indefinite period, but if we are to have a new-fangled way of uncapping, the Grimes family wants a practical, up-to-date machine.

The first idea that enters the brain of the uncapper inventor is to shave off both sides of the comb at once; but looking at such a machine from a practical point of view, how much time will be gained? For a slicing machine to work nicely the combs should be quite uniform in thickness and with a smooth surface, but the average bees will make more or less hills and hollows upon the combs, and these defects are more or less according as the season is a good or poor one, or as the honey-flow is slow or rapid. With many combs the machine would have to be set to take off all down to within a quarter of an inch of the bottom of the cells, and that would never do, for it would be taking away too much of our combs, and the tank would have to be placed under the uncappping-box instead of under the extractor.

If we try hard to get really nice combs for the machine, this is equally nice for rapid work with the knife. To get nice, fat combs for extracting, the Grimeses use 8 combs in a 10-frame super. It does not take an expert long to uncap nice combs; then we save much uncapping by extracting when the comb is one-half or two-thirds capped; two strokes to a side usually finishes it. From actual timing a comb can be uncap in from five to fifteen seconds, or an average of five combs per minute.

We must take into consideration the time for adjusting the machine, and the time to change the knives for a water-bath, for no form of knife will run long without getting that gummy edge; then there is bee-thread to clog the machine, and more or less broken in the way. Perforated, I would prefer the latter.

But let us figure a little. A machine would necessarily cost from $15 to $20. There are but few of our extensive bee-keepers who use perforated metal. In order to use the $20 machine a hundred dollars or more will need to be spent for exclusors. The large apiarist would be the one having the most interest, and a machine to become a success with him should be a very radical improvement.

A new paper came out of the California Bee Keepers' Association by "Rambler", and afterward published in this journal, it seems to set the pace for a machine to uncap several combs at once. That is a radical improvement in the right direction, and while we are inclined to say that it can't be done, it is very unsafe to say it, for more wonderful things than that are being done every day in this age of improvements.

I hope inventors will not take the above comments in the nature of a wet blanket. They are intended to lead
DURING one of the sessions of the International congress of bee-keepers, a French bee-keeper, Mr. Giraud, exhibited a frame containing dipt queen-cells, reared by the Doolittle method. This was a new thing for many present, and I wish that Mr. Doolittle had been there to take a little of the praise that was bestowed upon this practical demonstration of the success of his teachings. Mr. Giraud and his three sons are practical, wide-awake apiarists, and have been for several years readers of an American bee-paper, and it was in this that they found the Doolittle method. They stated that they had reared 314 queens during the season of 1900, in the best one of their colonies, while the queen was laying and the bees working in the customary way, and they reared them in the same frames that were used, except that zinc was substituted for the lead, and the dipt cells were covered with two, or three frames of zinc, and the queen was placed between them and the frames above and below to make them out of the outside of the hive. The queen was enclosed in the dipt cells, and kept adding more queen-cells as they removed the ones that were reared, and which were from a minute made by our method. An account of their doings so interested Mr. Calvert that he gave them two photographs of the artificial cell-breeding, and furnished him with a statement in French that I translated for him.

On the last day of the session the secretary of the committee on Apicultural Statistics made his report on apicultural cost throughout the world. He had received so voluminous a correspondence from the different countries of Europe, and from America, on this subject, that it was impossible for him to get it all into the report of the committee. But the detailed report will certainly be very interesting, and I hope to be able to give extracts from it to the readers of American Bee Journal whenever the printed report reaches me. The most interesting bit of the report, from our own country, sent by the Department of Agriculture at Washington, was quite extensive. He also had reports from some of the States of South America.

During the afternoon session of the last day, the congress decided to hold its next meeting at Bois-Le-Duc, Holland, in 1901. Mr. Secor was elected the executive committee as for this congress. Messrs. Bonnier, president; Sevalle, vice-president, and Calais, secretary.

That same afternoon, as the business of the congress was about over, and the sky was clear, as it had not been since our arrival at Paris, we ascended to the top of the Eiffel Tower—Mr. Calvert, my daughter, and myself. Going up into a monument a thousand feet high is not a thing of very great interest after one has been on mountains eight or nine thousand feet above sea level, but there is certainly no mountain in the world from which one can see as great a gathering of civilized people, as many mountains, or as many houses. The ascent may be made either in an elevator or by a stairway, but we selected the former with our money. The view from the top is rather pleasing, but the stairway was not enough to make us dizzy, and it costs just as much to walk as it does to ride. The elevators are large enough to contain some 60 persons, and they were full entire time. And they are run very smoothly, and start with a jolt, which is not unpleasant at all, the sensation of falling down into a bottomless pit, as one feels when let down with a jerk from some of Chicago's sky-scrapers.

From the first platform, 230 feet up, one can view all the city of Paris, some 50 or sixty of them being very conspicuous because theyloom up above the houses. The H shape of the Exposition grounds also shows itself plainly, and in the background, on one side, the heights of Mont-Magny, and on another the fortress of Mont Valerian stand in full view above the sea of houses. But when one attains the third platform, at a thousand feet of elevation, everything flattens down—the monuments, the hills, the white ribbon of the Seine, the Bois de Boulogne, the dozen villages, seem only like a living map. A trip in a balloon would probably give a similar impression. The houses make a sea of red tiles, the river is a silver thread, and the parks are green spots here and there.

Speaking of parks reminds me that I failed to mention my visit to the experimental apiary of the Garden of Luxembourg. It was a disappointment. The spot is unique, for it is the only apiary in the heart of one of the largest cities in the world. It is a very quiet corner, among the trees, and the shrubs and flowers, in the aristocratic garden of the palace of the French senate, and the bees fly back and forth untroubled and busy. But the hives were in a rather dilapidated condition, and it is evident that no pains are taken with them. The keeper very kindly permitted us to look at everything. We found half a dozen practical hives, roting without occupants, while a half-dozen straw hives with two or three occupants seemed the only experimental feature. I enquired for an observation hive, and he showed me a hive with eight or nine frames with glass all around. What one could observe with such a hive is more than I could say. I was told that some new culture were given every two weeks, in this place, during the summer. I doubt that any experiments of value are ever made there. France can afford something better.

In the evening of the last day, the apiarists of the congress were gathered at a banquet, in one of the restaurants of the exposition grounds, and numerous toasts were offered to the visiting delegates, who returned the compliments as best they could. On leaving, we opened our purses to pay our share, but the secretary, Mr. Calais, informed us that the luncheon delegates were given and that their expenses, even to the tips for the waiters had been paid by the management.

The following days' excursions were arranged with special pains for the delegates to visit the apiaries of two of the members, all expenses paid by the association, and I regretted very much that I could not take advantage of this; but my time was limited, and I had to leave Paris that very day.

If the Europeans are behind us in the matter of convenience of railroad cars, they are certainly ahead of us in securing cheap transportation. If I remember rightly, the amount paid by the association for these two excursions was less than a cent per mile, per person. Perhaps we will also get cheap transportation here, by the end of the season. But if we need not be afraid of the cost of traveling in Europe, after we are accustomed to travel in this country. But I earnestly hope that we are not going to take the habit of 'tipping' the waiters and servants as they do over there. It is sickening. You eat dinner—tip. You ride half a mile and discharge the cabman, pay—and tip. You go to the theater, buy your ticket, and tip the ushers. You leave the hotel, tip the servants, the bell-boy, and the bellman. The European is not afraid to do what we do not expect silver in every case, and this is the principal use of coppers. Two cents, three cents, make a very passable tip. If you give a dime, you get a smile. If you give a quarter, you get a bow. But if you give a dollar, there is no use looking behind, for a look of contempt will follow you till you are out of sight.

The Hum of the Bees is the Apple-Tree Bloom is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best composition written by Mr. Secor and Dr. Miller. It is, indeed, a hummer. We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journal can be issued to your subscription address; and it is thus preserved for future reference. Upon receipt of $1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

Please send us Names of Bee-keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.
CONVENTION PROCEEDINGS.

(From page 4.)

COMB FOUNDATION—EXPERIMENTS, ETC.

Prof. Gillette—I have been experimenting some the last three years with the British foundation sold by the company at Fort Collins, to determine the manner in which the bees handle the foundation that is given. It seems to me on so very important a question we ought to have more light. What weight foundation is best, for example, to use in the brood-chamber, and what is the best weight to use for comb honey? and to what extent does the giving of the foundation lessen the wax secreted by the bees? Do the bees really take the wax from the foundation and build it up both in the cells and down in the midrib of the comb? If so, to what extent? The experiments that I want to report upon are chiefly along these lines, and before proceeding, I might say what I say to you was published last year in the British Bee Journal at Fort Collins, which any of you can obtain, so long as they last, by simply addressing a letter to the director, and requesting Bulletin 94, or "Experiments in Apiaries." First, I thought I would endeavor to determine definitely whether or not bees do use the wax in the foundation. Everybody believes they do; no one doubts it; but I wanted absolute proof of it. I went to Mr. Elliott, who makes comb foundation, and asked if he could make for me some rather light foundation, I mean, that would work into a large comb, 1 lb. from the experiment station, to show you, but I will simply have to tell you, and you will have to take my word for it. Where foundation like that was used, about one inch, it was worked into at a large comb, so that it would show nearly to the ends of the cells. I happen to have a little piece here from the full-piece foundation. This was fully drawn at the center; this comes out here near the sides. The cell-walls this far [indicating] are black, and the foundations used are nearly.

A Member—Do I understand you to mean the black work down from the strip of lampblack foundation at that part.

Prof. Gillette—Yes, so that in cutting thru the comb and looking at the edge of it, the black nearly faded out at the ends of the cells.

A Member—What was the object of getting that black to stick to that.

Prof. Gillette—To see to what extent the bees did take that wax, and whether they used it right there where it was placed, or whether they carried it all over the hive and used it in the foundation. In some places, a small amount of a black wax was taken up by the colonies and used in smear, but not to any great extent did they carry it away into any other section—used it right there; drawn right down into the midrib of the comb. Having proved definitely that they do use the wax, I am going to try to find out to know whether or not they get that wax from the midrib of the foundation, or whether they get it from the cell-walls. For example, let that represent a section, the foundation, as you look at it, like this; the midrib is here, the edges are there. In any foundation there would be found, or in nearly all the foundations, there would also be a short cell-wall as shown there. Now, do the bees get this wax that they build the cells out of, wholly from those little short cell-walls, or do they go down into the base and midrib itself, and use it in building the cell-wall and extending the midrib? First, do they use the wax that is in the midrib? This I determined by three or four different means. First, I determined the weight of the comb and the cells taken out again. Here is a sample of the foundation, on which that comb was built. Then I took pieces of foundation and of the midrib from the comb on that foundation, cut them in and different lengths, and found that the weight of the original foundation was considerably more than the weight of the midrib taken out of the comb built upon that foundation. But now it might be possible that the difference in weight was due to a great extent to these little short cell-walls. The very heavy foundation weighed 11 grains to the square inch. Septum from the comb only weighed eight grains to the square inch after the bees had built the comb upon it and the comb-cells had been removed; then there were three grains to the square inch of the septum that had been used. In case of medium foundation, of which I have a sample here, and a sample of the midrib of the comb built upon this foundation—the foundation itself weighed 8.4 grains to the square inch; this midrib out of the comb weighed 5.18 grains to the square inch, being a difference there of about 3½ grains to the square inch of the midrib that these bees had used in the deep-cell foundation was also used; the foundation weighed 5.46 grains to the square inch. After the comb had been built upon the foundation and the comb-cells removed, then the midrib weighed only 3.4 grains to the square inch; but if I should take this foundation and cut it out off of the comb where it is built upon foundation, I could, this foundation midrib weighed only 2½ grains per square inch. It actually weighs less right here in this foundation than it does after the bees have built the comb upon it. And as they do not use any wax in this, and make it a little heavier, and the natural-comb septum, taking comb the bees have built entirely, without having given them any foundation at all, removing the cell-walls and taking the midrib of the comb from amongst the wax, you see the difference to the square inch. The difference in weights here was evidently more than could be accounted for by the removal simply of these small cell-walls.

A Member—Were all those tested alike, by being immersed in water.

Prof. Gillette—No, sir, not in all cases. There were cases where there was no honey at all. Those were not put in water. In all cases they were thoroughly dried before using: very frequently two or three days elapsed before they were used. The method which I used for determining whether or not they got the wax was to fill the comb with plaster, and that was suggested to me by Pres. Root. I filled the comb with plaster of Paris, and making sections of it and measuring the width of the midrib, and the depth in that, it was determined. This paper, this holds the midrib; it is perfect, it is not spread out at all. I found by measuring the midrib of the comb built upon a foundation—it was in all cases where heavy foundation was used—the comb was very thin. In cases where light foundations were used, foundations in which the midrib does not exceed seventeen one-hundredths of a millimeter, that they did not thin the midrib to any extent, usually not at all, which seems to me quite an important matter. If the midrib of the foundation does not exceed seventeen one-hundredths of a millimeter in thickness, the bees will thin it but little, if any, very little indeed; very often scratch it over to make it opaque, but very little used; if thicker than that, they thin it, and thinning it down to the thinness of the midrib in the natural comb. Is that clear? If you use a heavy foundation the bees never thin the midrib down to the thinness of the midrib in the natural comb. The natural comb I have found. I have placed upon the table here some of the different midribs that have been taken from combs; here is a specimen of midrib from natural comb, all made by the bees, and they thin it down to the thinness of the comb that forms the foundation when combs are used. In some of those cases it is as thin as the natural. Do the bees thicken these midribs in the combs they have built upon foundation? I think there has been a difference of opinion in regard to that, some thinking that no matter how thick—how much wax you may put in the little short cells of the foundation, the bees will always thin it down to the thinness of the naturally built comb. To determine that point I proceeded in
this way: I took a goodly number of pieces of comb that had been removed from the bee-boxes. I weighed each of the samples of comb that had been built upon different kinds of foundation. And care was always taken in this case not to use a comb that had been kept, because, if the comb had been kept, it would have to be unkept and the honey extracted. In that case, the ends of the comb would have to be removed, so I always took a comb that had not been kept.

I found that by taking these samples of comb, scraping the comb-cells all off the foundation, the wax of the midrib being thicker in both cases—10 grains to the square inch in the natural built comb, where it was 11 grains to the square inch in this foundation itself. Those are samples of comb one inch thick [indicating:]

Prof. Gillette—It is a comb one inch square. The comb built upon these heavy foundations, built out one inch thick, weighed 181/2 grains to the square inch. Natural comb, as I told you, averaged only 10 grains to the square inch. The bees, having the comb built, would have put on the wax that they needed, added to that foundation 8 1/2 grains more of wax. In other words, you gave your bees 18 1/2 grains of wax to save their secreting 2 1/2 grains of wax, because 2 1/2 grains of wax was added to the 10 grains of the comb, if they built this themselves. Take the lighter foundation, the medium Root foundation, running, I think, about 7 sheets to the pound, that foundation averages 8.4 grains to the square inch. The comb built upon it weighed 16% grains to the square inch; that is, comb one inch thick, the bees added to that foundation so as to make it weigh 6 1/2 grains to the square inch more than that natural comb would have weighed if they had made it all themselves. You gave the bees 6.4 to save their secreting 3.5 grains of wax. Without going thru the figures of the different weights, I found, I might say, that held thru all the tests I made, that, to all these heavier foundations the bees still applied a very little more wax than they might have applied without those secretions,altho they did not need to do it. It seems to me that we only economize the secretions of the wax on the part of the bees to a very small extent by giving them wax in the foundation. It seems to be the nature of the bees when building comb to secrete wax, they do more or less, I have no doubt, and secreting the wax to a very large extent, even the wax was given them to begin with. Then what kind of a foundation can we use that would be most economical in cells? I might simply say I found the greatest economy apparently from my own measurements to be in the foundation which has, as measured, as nearly the weight of the natural comb midrib as you can get it—the foundation made near the end of the natural as you could get it, and with not a very large amount of wax in the cell-walls of the foundation.

I presume you have all used, to some extent, this rather short deep foundation. It seems to me that contains about, a Mason—was in the cell-wall one inch can be given with the greatest economy in the building of the comb. I believe that is all that I will take time to tell you about now, unless you wish to ask questions, except simply to call your attention to some of the samples that I have here. In these little paper boxes, I have placed samples of sections of comb and of foundations, and many of them are arranged in this way—one of them showing the section of the foundation and the other the section of the comb built upon that foundation, which would like perhaps to compare them, and see if you can see with your naked eye the comb built upon the foundation and midrib thinner than that built upon the foundation. Some samples show plainly, and I have marked it in the following manner: A would be a sample of a foundation cut thru; a sample market A A would be a sample of the comb built upon that foundation. The same is true of B, C, D, and so on. By bearing that in mind, you can compare the sections of the foundation and also of the section of the comb built on it. I have also one or two sections here of the comb cut at right angles to the cells, and I would like to have you see how very delicate and beautiful the section of the natural comb. This is one of the points of interest. I have a sample of foundation and also a sample of the section of comb built upon that foundation, and you can make comparisons of them. These can be put around.

D. H. Coggshall—I have noticed where we run for extracted honey, in increasing my amount of comb for-
tracting purposes, that by slipping a sheet of foundation in with the other combs, the bees will use their surplus wax that they produce on this foundation, and it saves me labor. They don't crowd the extracting place; where there is a surplus place they fill up, they don't crowd so; where there is no foundation in there, they will crowd every spot and fill it all up with bar-combs. To overcome that which might be the case, I cut deep slices from the combs; that wax goes in with the cappings, and I have it in wax. That is the way I overcome the bar-combs. Otherwise I claim the wax would be wasted. They will produce wax when they are gathering honey fast, and they must have some place to put it.

Pres. Root—With regard to this matter of foundations, we have Mr. Rankin here of the Michigan Experiment station who wishes to relate some of his experiments, which I think will bear out the experiments already given by Prof. Gillette.

Mr. Rankin—We had some samples of foundation which were made by the A. I. Root Co., of different weights, ranging from 7 to the pound. The sheets were the size of the Langstroth frame; we used these foundations in different ways thru the hives, and I used different methods of wiring. We used the vertical wires, some wires only, some wires only, and some wires and foundation. The wire was 13 sheets to the frame and the foundation stretched from one side to the other and stretched at a right angle to the foundation. With the horizontal wires, the wires stretched from one side to the other and left a perfectly straight comb. I was showing it to Prof. Gillette when he was at the college. I think he would bear me out in the statement. It seemed a little bit stronger because I thought, and I might say too, that the foundation with 13 sheets to the pound seemed to give just as good satisfaction as that of 8 sheets to the pound. I think that the lighter we get our foundation the more economical, and it will answer the purpose just as well. Two years ago we had an experiment in surplus wax. The advantage of full sheets or half starters has been clearly analyzed. It is shown there is just a little over one percent more wax in the sections which had the full spread of wire, than in the sections which had half-starter. The foundation used was Root's extra-thin, also the Dadant. There is no difference in the two foundations.

Pres. Root—The experiments which have been given, are quite interesting; they show bee-keepers have been using too heavy foundation. There has been too much wax in the midrib certainly, and, probably, too much in the walls. The experiment which Mr. Rankin gives, that 13 sheets to the pound, wires horizontal, give as good results as 8 sheets to the pound, wires horizontal, is quite remarkable. It isn't our experience, but it is possibly correct. I think it would be well for bee-keepers to begin using four sheets to the pound. If you are using too much wax, you ought to know it. The experiments shown before me do indicate that if one can use thin foundation in the brood-frames we have been working, and so have all the foundation-makers, towards lighter foundation. Several years ago, heavy foundation was used by bee-keepers, and later they have been using lighter foundation, which has been a great economy to the bee-keepers and saved a great deal of wax as well.

Dr. Mason—Mr. Rankin stated in putting in vertical wires, they don't have the experience. I use vertical wires and make my foundation on the wall. I have tried the horizontal wires, and with me it has been a failure every time; a good deal more to say it than with the vertical wires.

Mr. Rankin—Have any tried foundations milled at different temperatures, and found any difference in the working of the bees upon them? Which do they find best—the wax that is hard and stiff, or the soft, pliable wax?

Dr. Gillette—I have made wax that has been milled.

Mr. Rankin—I don't know anything about that.

Mr. Taylor—In reply to this question, I may state that at the time I was conducting experiments for our experiment station in Michigan, I made an experiment on that very point; I used wax in making foundation when it was at a very low temperature, just as low as it was possible and get to press it at all properly, and also at a high temperature, and I compared them and I could see no difference in the results. One seemed to be worked out just as well as the other.

Mr. Rankin—I would like to ask Dr. Mason how many sheets of foundation of the Langstroth size he says he gets to the pound with a Given press.

Dr. Mason—That depends altogether on how thick I make the sheets. From 4 to 10 sheets.

Mr. Taylor—You can make them 4 or 11, just as you are a mind to.

Continued next week.)

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER

Racine, Wis.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail. Editor.)

Drones in Worker-Cells.

Last fall I bought a 5-banded queen, and after commencing to lay I noticed that about half of her brood in worker-cells were drones. Do such queens ever get over this drone-laying business? Or should I take off her head at once? She appeared to be laying less drone-eggs and more worker-eggs after being in the colony a few weeks.

MASSACHUSETTS.

Answer.—It sometimes happens that a young queen, or one that has been thru the mails, lays more or less drone-eggs in worker-cells, and afterward lays as a good queen ought. Don't be in too much of a hurry in deciding against her.

Bees Leaving the Brood-Chamber—Best Hive for Extracted Honey, Etc.

1. I have had bees for four years in Langstroth hives, and they always have been breeding below, but this year they all went up into the supers; some hives had no bees and other supers were over run with bees. We had a very hot summer. Was it too hot for them below?

2. I am working for only extracted honey. Which is the best hive for the purpose.

3. Should I save 10 supers with 8 or 10 frames and what kind of frames are the best?

4. My best honey-flow is in September, and the first part of October. From what flowers could that be?

5. In what hive can bees be handled the best and the easiest?

New Jersey.

ANwERS.—1. The heat would hardly account for the bees going above, for generally it is warmer above. In the cases where there was neither brood nor honey below, it looks as if they might have had the super or upper story all winter. In that case, they might move above in the spring because it is warmer above.

2. There is probably nothing better for you than the Langstroth size of frame.

3. For extracted honey, you will like ten frames better than eight. As already said, the Langstroth size of frame, 17%, is not excelled. If bee-glue is not troublesome in your locality, you may like the Hoffman frame, but if bee-glue is plenty, it will be better to have frames spaced with staples or nails. In the upper story shallow frames not more than 6 inches deep. The objection is that such frames can not be used in the brood-chamber.

4. Hard to tell without being on the spot. Possibly as ters or hindered.

5. There isn't much to choose. Perhaps nothing better than the common dovetailed hive. Remember it isn't the hive that makes a difference so much as the man, the locality, and the bees.

Managing Swarming in Out-Apilaries—Bees Fanning at the Hive-Entrances.

1. On page 808 (1900) "Ind." asks how you run your out-apilary for comb honey. You say your latest plan was to visit the yard from 5 to 7 days. How do you go to work then—take out every frame and see if there are any queen-cells on them? And then you say, Destroy the eggs or grubs so as to keep them from swarming. I should judge that would be quite a job, to look over an apilary of 100
colonies or so. Now, some bees will swarm without having their cells cast; where will your swarm be if you don’t go there within 5 or 7 days? Anyhow, the queen would be gone. As I understand that you clip your queens’ wings, I think it would be the safest way to have somebody right along with you to have one ready.

2. Why are there always some bees fanning at the entrance? Some say it is for ventilation. I hardly agree with that, because my bees had a flight yesterday, and then some were fanning. If that is to cool the hive, what are they going to do when it is about 100 degrees in the shade? ILLINOIS.

Answers.—1. You are right; it is quite a job to look thru a lot of hives for queen-cells; you are also right in thinking it would be a safer plan to have one watching for swarms. But it would be a good deal of expense to have an extra hand at each apiary to watch for swarms. Of course, there’s no law against others having a watcher on hand all the time.

Y. some colonies will swarm, and the swarm will be right there in the old hive (except in a few cases where it may enter another hive.) Then the thing needed is to destroy the extra cells, or in some way provide against a swarm issuing again.

I’m not insisting that the plan is satisfactory, and as soon as I learn something better I’ll drop the present plan.

2. In nearly all cases bees ventilate at the entrance for the purpose of changing the air in the hive. Even if the air was none too warm it might need changing on account of its impurity. In fact it is just possible that the air in the hive was warm or foul, notwithstanding the fact that the outside air was not above 50 degrees. After being confined to the hive quite a number of days, the bees may become very much excited upon the occasion of flight, and that excitement may run up the inside temperature above the desired heat. It is quite likely, however, that you had one of the exceptional cases in which bees ventilate without any need of ventilation. I’m not certain whether the book tells about it, but one may often notice a bee ventilating at the entrance because it has accidentally got to the wrong hive, or for some reason is afraid of the reception it will get. A bee afraid as to its reception falls to ventilating, apparently because it thinks it will show it is willing to go right to work helping as one of the members of the colony, and ventilating is the first work that comes to hand. When a strange bee goes to ventilating it is not likely to be ill-treated by the guards.

Grading Honey by Tinted Glass.

I notice on page 88 some comments on the grading of honey by color, by the use of tinted glass, and I wonder if the idea originated among the British bee-keepers. It was advanced something like a year ago in the columns of the Progressive Bee-keeper, and, by following instructions there given, bees of a number of glasses of different tints can be graded by numbers from the darkest buckwheat to water-white. NORTH CAROLINA.

Answer.—Yes, perhaps as long as two or three years ago, there was some discussion in American bee-papers as to the matter of grading by samples of glass, celluloid, etc., and the British idea may have started from that, or it may have been an indigenous product. At any rate, our British cousins seem to have gotten the start in the matter of actual application.

**Does Sweet Clover Cause Bloat, or a Bad Flavor in Milk or Butter?**

Does sweet clover ever bloat cattle or sheep as alfalfa or red clover does? Does sweet clover give a bad flavor or odor to milk or butter? NEBRASKA.

Answer.—I do not know why, under favorable circumstances, sweet clover might not cause bloat as well as alfalfa or red clover, but I do not remember seeing any report of the kind, or any report as to its giving bad taste to milk or butter.

**Worker-Comb’s Rejected by Bees.**

I have a large quantity of good worker-combs, but being empty and not in use, they were laid aside for a season in a damp place. On this account they got hard and brittle. The bees now reject them, tho placed in the very center of their hives on a warm summer day. They pass over them, or destroy them. Can any one suggest a remedy? Is there any way to soften them, or make them acceptable to the bees. ONTARIO.

Answer.—I don’t know of anything to help, if the combs are so bad that the bees destroy them. Who does?

---

**The Afterthought.**

The "Old Reliable" seen thru New and Unreliable Glasses.

By E. E. Hasty, Richards, Ohio.

POLLEN AND HONEY AT THE SAME TIME, ETC.

Most of us know, notwithstanding scientific doubts thrown at us, that bees often gather both nectar and pollen at the same time, but I suppose few had right in hand the positive proof to reply with which a scientist would require. I am glad Mr. Davenport is able to say he has taken hundreds of bees laden with both. I see no reason why a good colony scant of stores might not be given a super of unfilled sections in a warm cellar. Glad to hear that this style of feeding marks well on a considerable scale. If honey that has been fumigated with bisulphide of carbon will kill a colony of bees in the cellar, said honey is pretty sure to be of no particular good to deliver from human stomachs. That experiment ought to be repeated until we know whether the death of the bees was from poison or from fortuitous circumstances. Page 776.

SELECTING A HOME BEFORE SWARMING.

"Rip" is undoubtedly right that bees do not always select a home before swarming. We may suspect as much when they have a long distance from the home hive, and take a decidedly different direction when they start again. Also when a prime swarm comes out on a desperately hot afternoon, with little or no preparation visible in the hive. It is not likely that invisible preparations have been going on when there were no visible ones. That virgin queen got so tired in flying 50 feet that it took three days to rest her enough to start again, the “born-tired” record may be conceded to her, altho some human parlor-virgins could doubtless run her close. Page 777.

HONEY-DEW IN WINTER STORES.

McEvoy’s experiment of wintering with honey-dew is instructive, especially that part of it where part of the combs held good honey, and the bees lived somewhat longer for it but perished eventually. Page 779.

CORING A HONEY-FUNNEL.

The cork on a wire to stop and unstop a honey-funnel from the inside looks like one of those trifling but very valuable little inventions which sometimes come along. Page 787.

SILVER LINDEN NOT GUILTY OF KILLING BEES.

Notwithstanding the reliability of the journal that makes the accusation, I strongly think the silver linden is not guilty of killing the bees. Bees died of disease otherwise contracted while the accused tree happened to be in bloom, I think. Such disease need not be much different from some we sometimes called “footing it.” When we see multitudes of bees not able to fly crawling on the ground about the apiary. It is not impossible, moreover, that the same fungus which injures the linden, and keeps them from yielding as they used to do, also injures the bees, which get more or less of the spores of mycelium. Page 788.

BURNING COMB TO SETTLE A SWARM.

Most of our veterans will smile at burning comb to make a swarm settle. And yet more unpromising things than that have turned out well. In famine times the other flying bees of the apiary would be drawn by the smell of wax; and a swarm long on the wing might come, not to the smell, but to the crowd. For just once in their lives the bees belonging to the swarm don’t want to gather anything—or do anything except “scicgle.” At least that’s the “orthodox” view of it. Page 788.
The "Know It All" Kind.

I have been trying to get new subscribers to the American Bee Journal, but the bee-keepers around here seem to "know it all," tho' they find there is something lacking when they compare their honey-yield with mine, which is usually two or three times larger than theirs. H. C. Binger, Shiwawassie Co., Mich., Dec. 29.

Bees in the Cellar.

My 36 colonies of bees have been in the house-cellar since Nov. 17th, with the temperature from 38 to 45 degrees. The bees are quiet and dry, and there are perhaps a quart of dead bees on the cellar-floor. I have been looking at the bees and imaginations three times this low-power magnifying glass, and feel that what a high-power microscope would reveal must be wonderful. The bees and the bee-hive are a constant source of wonder and surprise to me.

F. W. Hall.
Sioux Co., Iowa, Dec. 25.

Bees in Fair Condition.

I commenced keeping bees two years ago, getting my start from a colony of bees that was in a knot-hole in the side of the house.

This year was almost a failure here. We secured no surplus, but our bees are in fair condition for winter. I think this locality is all right; I am going to give it a fair trial, anyway.

The American Bee Journal is just what every bee-keeper needs in his business. Success.

Dan X. Haskin.

Gathering Pollen and Nectar.

During the forepart of the past season we had such a drought as was never known here, bee-keepers, as well as those in other lines of business, were very much discouraged, and expected very little profit but the July and August rains brought new life, and the result was better than expected.

My yard contained 29 colonies, spring count. They increased to 50, and stored a surplus of over 1,000 pounds.

On page 776 (1900), Mr. Davenport refers to a statement made some time ago that bees do not gather both honey and pollen on the same trip. I noticed the same statement, and thought if it were true at all it most certainly was not universally so. My observation confirms what Mr. Davenport says. I never thought of making a test at the hive-entrance as he did, but have observed closely the bees on the bottoms of the hives. Their every movement and appearance were convincing that they were loading with both honey and pollen. This was especially noticed on the bloom of the high bush cranberry. This bloom is a cluster formed by a number of small blossoms, whose petals touch each other, forming a beautifully arched sur-

and if so, I wish there might some day be published an article giving his experience with it.

We have a honey-plant here that is a good one. It is a biennial, and has only a few long narrow leaves the first year; the second year it has a long stalk and commences to bloom. The flowers are blue, and from June until frost you should see the bees on it; I have seen them fairly busy over it, like a lot of school boys just let loose. I do not know the name of it, but the flowers are not larger than a Canadian five-cent piece. I have seen them growing only in two places in Canada, and it seems to me we must have gotten them in some brewery refuse in some way, as they were growing around breweries.

W. D. HARRIS.
Ontario, Canada, Dec. 21.

Did Fairly Well.

Bees did fairly well in this locality. I secured about 4,000 pounds of comb honey from 57 colonies, with an increase of 20.

C. A. STANNARD.

A Discouraging Season.

In the spring we started with the expectation of having a good honey season, and our bees were out in good time and went to work. The weather was warm so that we soon had plenty of bees. White clover bloomed in abundance the last of May, but the bees did not store any honey from it. Basswood has been our main source for honey, but the worms destroyed that two or three years ago, and last fall they stripped the trees of their leaves again. Our crops this season ran all the way from 0 to 50 percent of a crop, so far as I can learn of my bee-keeping neighbors. Some sell their comb honey at 10c per pound, and the extracted at from 5 to 8 cents. It is hard to keep up a home trade where we run across some one else peddling it at 50 cents per gallon, and three sections for 25 cents. I get 8 cents per pound for extracted honey, and that is the only kind I have.

F. C. SMITH.
Pierce Co., Wis., Dec. 19.

A Successful Beginner's Report.

Two years ago I became interested in bees by hiring a large swarm that alighted near my home. I put them in the back yard and began to study their habits. I found the subject so interesting that I gave it all my spare time. Not knowing exactly how to care for them the first winter killed so many that I started in this year only a handful, and it was all they could do to get ready for last winter, but they came thru in fine condition. I took off the first surplus honey they produced last summer, and fixt them for this winter leaving them about 35 pounds of honey. I use the 10-frame Langstroth hive. A bee-keeper living here who saw the bees last summer said it was the finest colony he had ever seen. Having just the one colony, and buying the very best of everything, I have kept to keep it as neat as a pin, and I also profited by the valuable suggestions found in the American Bee Journal. As soon as possible I hope to increase to 3 colonies, which will be as many as my business will allow me to care for.

W. D. HARRIS.
Ontario, Canada, Dec. 21.

The Ohio Farmer

AND THE

American Bee Journal,

Both One Year for only $1.40.

THE OHIO FARMER is clearly one of the leaders of the agricultural papers of this country. It is a 20-page weekly, often 24 pages, handsomely printed on good paper, and CLEAN in both reading and advertising columns. It has the largest actual staff of editors and correspondents (all farmers) of any farm paper publish, and is practically progressive in defending the farmer's interests.

It will help you make "The Farm Pay." Send to OHIO FARMER, Cleveland, Ohio, for a free sample copy.

Remember, send both the Ohio Farmer and the American Bee Journal, both one year for only $1.40.

Address.

GEORGE W. YORK & CO., 118 MICHIGAN STREET, CHICAGO, ILL.

To Exchange Rates & Edmonds 1/4 and 3 h.p. gasoline engines. Wanted long-power, hand, and stationary of all kinds.

Machinery FOR SALE—Teasen machine, drover machine, two-spindle wood shaving machine, table, guages and saws, shafting, pulleys and belting. FRED DAVISON, Walker, Mo.

The "Barler Ideal"

OIL-HEATER....

Saves Its Cost Every Year.

No Odor! No Smoke! No Ashes!

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is wholly well made through. The urn removes for heating water. The brass font, or well has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. It is tight as 1/25 of a foot, and weighs 20 pounds, or 30 pounds, delivered right for shipment, either by freight or express.

Price, f.o.b. Chicago, $6.00; or combined with a year's subscription to the American Bee Journal—both for only $6.50. Full directions go with each stove.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address.

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Please mention the Bee Journal when writing Advertisers.
The white clover was a total failure here last summer. All the honey our bees harvested was from sweet clover which is very abundant in this locality. The late Mr. Muth, I believe, is given the credit of being the one who covered over the clay and stone hills with it.

Altho I am only keeping bees for the enjoyment I derive from it, I could not have succeeded as I have without the help of the Bee Journal.

A. W. MACRAE.
Hamilton Co., Ohio, Dec. 19.

The Novelty Pocket- Knife.

Your Name and Address on one side—Three Bees on the other side.

HORACIA M. MELBEE, HONEYVILLE, O.

This cut is the Full Size of the Knife.

You may have a Knife which looks like this, but it will not be as sharp as the pocket Knife shown above. The Novelty Knife is indeed a novelty. The Novelty Knife is the handle. It is made of a beautiful picture of one of the leading bee-keepers. I always read an article with more interest when I know what the author looks like. The pictures of the different localities all over the country are also very interesting feature to me. Keep the pictures coming, even if you have to ask a little more for them. I found out that I think you are giving us a most excellent paper for the price we pay for it.

O. B. GRIFFIN.

Loss From Diseased Brood.

This has been another bad year for bee-keepers in this part of the country. Foul brood, black brood, or pickled brood—call it what you may—is doing its work. It looks the same as the comb of infected brood shown at the National Bee-Keepers Convention in Chicago last August. I had nearly 50 colonies and nuclei affected with it. I treated them accordingly to the Memorial Plan, but the disease reappeared in some colonies, while others dwindled away in spite of my efforts to strengthen them. The “glue-paper” was changed in all cases. But the dead brood was sour and had a very offensive odor after it commenced to turn black. There were only two colonies that had the “glue” smell, and in which the decayed matter had become ropy. I purchased 11 colonies and transferred during fruit-bloom, and at that time I saw signs of the disease. In June I detected the disease among them, and by fall all were dead. I sacrificed several good colonies trying to build them up. Not one of the infected colonies stored any surplus, but twenty colonies alongside which were not infected, stored from 20 to 60 pounds per colony of beautiful comb honey. The disease first appeared here in

Sharples Cream Separators: Profitable Dairying
A HANDY TOOL-HOLDER!

Sent by Express, for $1.50; or with the Bee Journal one year—both for $2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or anyone using a grind-stone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening saw-blades included in the above price. The work is done without wetting the handles or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

Directions.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired bevel by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an inside the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

Grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, Ill.

Scientific ** Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature’s ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeders of the world.

Bound in cloth, price $1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at $1.00 each; or for $1.00 we will mail the book to any one and credit a year’s subscription on the American Bee Journal. Address, GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, Ill.

1894 or 1895. The next year after its appearance I lost 70 colonies. That was a genuine foul brood, and I showed it no mercy but burnt everything. Since then I have suffered but little from its effects, until the past year and then I was puzzled. I do not know whether I will stand another full season, as I believe every apiary in the bottoms is infected more or less. If I remain in the business the coming season I will fall back on the fire remedy, as I know that is sure.

The season here was fair for honey, and the good colonies stored honey until at least the end of October. Out of 70 colonies I have about 30 left, and will lose more by spring.

Good套装. I began the bee-business 7 years ago with one colony, I now have a month’s supply of honey, which has been very useful to me, and I have as many as 15. During the past summer there was no clover of any kind, and the two colonies did not cast any swarms, nor did they store enough honey for winter, and so had to be fed. I have got 1000 pounds of honey from one colony, spring count, as was reported the other day, from my two new summer I might get 300 pounds, which would be some encouragement to continue, but the way things look now I shall have neither bees nor honey left by fall. When people tell about having to feed their bees for winter, I know how to sympathize with them, but some of the stories that get into the papers are big enough to choke me.

Hennepin Co., Minn., Dec. 25.

The Lightning-Bug Bee!

While the long and short tongued bee is being so much discredited I wish to say that I bought a strain of bees from an old fellow that kept few bees in this neighborhood years ago, and they do say they cast with the lightning-bug and work by night! (No queens for sale.)

DANIEL JONES.

A Drought for Three Years.

An unprecedented drought of three successive years has visited southern California, and the beekeepers and the grain farmers’ interests suffered very severely, we are reduced in numbers to a minimum of a few apiaries, and we had to work out to make ends meet. We all hope for a better season to come.

This is the land of perpetual sunshine, but farmers and beekeepers have been scanning the sky only to be disappointed, and a radiant hot sun pours forth on the hills, valleys, and meadows.

GUSTAV VOSS.

Riverside Co., Calif., Dec. 22.

Hardly Paid Expenses.

The bee-business has hardly paid expenses the last three seasons, and it is hard scratching to spare the change for more subscriptions which you can’t run the “Old Reliable” without money, and I can’t do without the paper. I will try to keep bees one more year before I give it up.

T. M. BARRETT.

Orange Co., Calif., Dec. 20.
Good Honey Crop.
We had a good honey crop in the spring, securing an average of nearly 70 pounds of comb honey per colony, but our fall flow failed entirely, and we found feeding necessary for the first time in six years.

We have had a lovely winter so far—frosty mornings, but warm enough for the bees to be active in the daytime. Now our bumble and halmy, and the bees are in full flight now. Maple will be in bloom in a few days, and pollen-gathering will begin.

I feel as tho I cannot do business without the American Bee Journal, which, I think, is the best of all bee literature.

A WHOLE GARDEN
For 14¢.
We wish to raise this year 50,000 new sets of plants for the market. This will be done with the nicest care by the best methods of cultivation, and we can offer the best and finest stock of any kind at a reasonable price. The seeds are offered for sale now, and will be ready for planting in a few weeks. The following are the kinds of plants we offer for sale:

Petunias—White, Rock, and Lavender
Scented Geraniums—Red, Pink, and White
Cineraria—Red, Pink, and White
Lavender—White, Pink, and Purple

The price is 14¢ per set, and the seed is offered for sale for $.25 per pound. We have a large assortment of plants, and can supply any quantity. The plants are raised on our own grounds, and are of the best quality. We are anxious to supply the market with the finest stock of plants, and are willing to sell at the lowest prices.

J. A. C., L. O. BEER, Co., Longwood, Wis.

To Last Ten Years.
Without reservation we warrant our Cyphera Incubators to do all the work required of them, or we will replace them, if necessary. Two large models are in self-repair and regulation, and the same for fire-proof, self-sealing; to produce stronger chicks in all sections of the nation, and at any price.

The Cyphera is a new and superior model, and is the only one used by beekeepers in the United States. The price is low, and the model is the best in the market.

The Cyphera Incubator Co., Chicago, Ill., and Box 50, Mass., Please mention the Bee Journal when writing.
We have a Large Stock on hand and can ship promptly.

SEND US YOUR ORDERS FOR
Hives, Extractors
OR ANYTHING YOU WANT IN THE
BEE-KEEPING LINE.

WE MAKE ONLY THE BEST.

Our Falcon Sections and New Process Foundation are a thousand better and cost more than other makes. New Catalog and copy of THE AMERICAN BEE-KEEPER free. Address,

THE W. T. FALCONER MFG. CO.,
JAMESTOWN, N. Y.

W. N. Graham, E. M. Bingham, N. H., carries a full line of our goods at catalog prices. Order of him and save freight.

24th Year
Dadant's Foundation. 24th Year

We guarantee satisfaction. **
What more can anybody do? BEAUTY PURITY, FIRMNESS, No SAGGING, No OILY ROOTS.

PARENT Waxed COMB FOUNDATION.

Patent foundation, with waxed comb. Order from your dealers or address, CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

Why does it sell so well? **
Because it has always given better satisfaction than any other. Because in 23 years there have not been any complaints, but thousands of compliments.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

LANGSTROTH on the HONEY-BEE—Revised
The Classic in Bee-Culture—Price, $1.25, by Mail.

Beeswax Wanted ***
AT ALL TIMES.

MADE TO ORDER.

Bingham Brass Smokers,
chose of sheet-brass which does not rust or burn. We should last a lifetime. You need one, but they cost 25 cents more than in the same size. The little pen cut shows our brass huge cut on the three larger sizes.

No wonder Bingham's 4-inch Smoke Engine goes without puffing and does not DROP INKY DROPS.

The perforated steel签-plate has 20 holes to air the fuel and support the fire.

Prices: Heavy Tin Smoke Engine, four-inch Stove, per mail, $1.50; 3½-inch, $1.10; three-inch, $1.00; 2½-inch, 90 cents; two-inch, 65 cents.

BINGHAM SMOKERS
are the original, and have all the improvements, and have been the STANDARD OF EXCELLENCE for 22 years.

Address, T. F. BINGHAM, FARM, MICH.

Please mention Bee Journal when writing.

Sections—A Bargain.

We have 50,000 3¼ x 1½ inch plain sections, and as our call for them is light, we will sacrifice them. Prices very low. Write.

Aptaries—Glen Cove, L.I. J. J. STRINGHAM, 105 Park Place, New York, N. Y.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address, GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
YELLOW OR WHITE

**Sweet Clover Seed**

**Free as a Premium**

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us $1 with a new name for this year, we will mail, postpaid, to the one sending the new name and the dollar, either **one pound** of yellow sweet clover seed, or **two pounds** of the white sweet clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with $2.00) and get the three pounds of seed.

Address,

**GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.**

---

**Weekly Budget**

Mr. J. A. Golden has an advertisement on page 46, offering his stock of Golden combination Hives for sale. Write him at once if you want to try his system of producing comb honey.

John H. Martin, better known as Ram-ber, has been keeping bees for some time in Fresno Co., Calif. He is now in Los Angeles county again, and wrote us as follows, Dec. 22nd:

"I have returned to the south after a successful season in central California. There was a grand rain here about Nov. 29th, but since then the skies have been clear. Bee-men who smiled broadly then now look sober. It is time for another rain, and if it does not come soon there will be a lot of blue bee-keepers. It is the old, old story—the bee-men here never know where they are at respecting a honey season till well towards spring. After nine months absence from my old apiary, I find them flourishing and the bees are anxious for a good honey season. And for which we all devoutly hope."

Walter S. Ponder, of Indianapolis, Ind., writing us Jan. 4th, had this to say:

"I regret exceedingly that you have been so unfortunate as to lose a fire in your establishment. You have my sympathy, and I hope the loss and inconvenience will be less than expected. I have often wondered what I would do in case of fire here, but in your case, with the Bee Journal on your hands, I know the situation must be very serious and troublesome.

"I have had no bill for my last quarter's advertising, but think the little amount might do you more good right now than later. Find check enclosed."

Thank you, Mr. Ponder, for your kind words of sympathy for us in our "food" of troubles. We hope you may never be visited as we were; but, as the saying goes, "a bad beginning makes a bad ending," we may end the 20th century all right—though we will not likely see its end.

O. L. Hershiser, superintendent of the Pan-American Exposition, wrote us as follows January 7th:

"My Dear Mr. York:—A letter from E. R. Root has informed me of your loss by fire, of the offices of the American Bee Journal. No particulars were stated, but I trust you had insurance protection, and that the only loss to the readers of the American Bee Journal will be some necessary delay. I regret the inconvenience you will be occasioned, but I have no doubt of the future of your excellent publication, even against the scourge of fire. It would be quite un-Chicago-like for anything in your enterprise city to be subdued by that or any other calamity. The enterprise of the American Bee Journal is well shown from the fact that, although the office was burned on the evening of Jan. 7th, we were informed, we had the initial number of the new century before learning of the disaster.

"Wishing the American Bee Journal a prosperous century in the hands of its present proprietor, and his successors, believe me,
Yours very truly,
O. L. Hershiser."

As noted in last week's Bee Journal, our loss was occasioned by a fire, that was thrown on the fire which was above us. It was almost a miracle that we were not burned out also.

We wish to thank Mr. Hershiser for his kind letter.
Yellow Wax and Slow Cooling is a subject which receives considerable attention in the first number of the American Bee-Keeper for the new century. Editor Hill seems to understand that this journal teaches that any sample of wax, no matter what its color, and no matter what may have caused that color, may be changed into bright yellow wax by simply cooling it slowly. This journal has never pretended to claim for slow cooling anything more than that it allowed the foreign particles time to settle. The average beginner will have a cake of wax that has been rapidly cooled, and so of dark color because of its impurities. If nothing has been done to affect the color of the wax except the rapid cooling, slow cooling will clarify it, of course, it may be made still brighter by acid.) That's the whole thing in a nutshell. The editor of the American Bee-Keeper has emphasized the necessity for slow cooling, and nothing that he publishes in his last number militates with the teachings intended to be given here. It is a regrettable circumstance if lack of control of the English language has allowed any meaning to be given that was not intended.

The Long-Tongue-Short-Tube problem is still on. J. Warren Arthur, in Gleanings in Bee-Culture, reports advance at the red-clover end. The interesting details are as follows:

In 1896 I noticed bees going and coming in one direction, namely, southwest. Thinking to find what they were working on, I followed in that direction, and found very few bees at work on or near the ground, and no timber of any appearance on which they could work. About a mile and a half from home I found a clover-field fairly swarming with bees, while a clover-field of 20 or more acres one side of it, not 50 yards apart, and not more than 40 feet from the remainder of my lot of 30 acres, had very few bees on it. Some two or three days after, I noticed the bees stopping work about noon, and taking my wheel I rode around and found my clover-field laid low. When the second crop came in bloom I again noticed the bees in particular, and found them working on this same field, although the field across the road from my home contained many more bees than on the first crop. This fact alone caused me to decide that I wanted seed from that particular field. When the neighbor hauled his seed, by offering a few cents above the market price, I obtained it, but had to take the entire crop to get any. I managed to sell some of it to some of my neighbors, and some more to my father, who lives about ten miles southwest of me.

The crop of seed soon near me in 1899 was almost a failure in catching, and what did catch was winter-killed last winter, while some fair fields were left over at my father's. My prospects for honey last spring were from thing but bright for 30 colonies, so I decided to divide up territory. I took five of my weaker colonies and one strong one to my father's; four were taken to a place where there were a fair number of basswood trees, altho badly cut by the canker-worm. Well, this fall I had 24 colonies to feed, nearly all being at starvation's door.

My father said when he cut his hay he never saw bees thinking of a buckwheat patch than on his clover. I made a trip to see how they were doing, and had the pleasure (I?) of helping him haul up his hay; but when that clover-field bloomed for seed, those bees filled up everything tight; and I was surprised, on going down one day, to find them so. Now, I feel that that clover had something to do with it. But the weakest colony taken down there built up the strongest, yet could not have been fuller of honey than the other five.

It has been suggested in Gleanings that wherever there were bees with tongues long enough to work on red clover there would be seed matured on the first crop. The possibilities that lie in this suggestion are worth consideration. It is well known that seed from red clover is secured only from the second crop, altho the reason therefor is not so well known. It is a very simple one. The fertilization of red-clover blossoms is effected mainly by bumble-bees. Unlike our hive-bees, bumble-bees start in the spring, not with several thousand bees in a nest, but with a single bee. It is well known that seed from red clover blossoms, bumble-bees are so few that not enough blossoms are fertilized to make a crop of seed worth harvesting. By the time the second crop is on, the number of bumble-bees has multiplied many times, and a full crop of seed is secured.

Now, if hive bees are secured with tongues long enough to work on red clover, it is easy to believe that they may fertilize the first crop. From this first crop it will be easier to obtain seed of the short-tube kind. A little explanation will make this clear. In the second crop of red clover there will be tubes of various lengths. Hive-bees may work on the shortest of these, or the bumble-bees on the rest. So it will happen that the seed from this crop will produce blossoms having tubes of different lengths, with perhaps a constant tendency to revert to the original and longer type. Only by difficult and careful selection under such circumstances could a flat type of short-tube clover be secured.

Now, instead of waiting for the second crop, let fall attention be given to securing seed from the first crop. The hive-bees will fertilize the blossoms with short tubes, and those with long tubes will for the most part be unfertilized. So whatever seed is secured from that first crop will be of the short-tube kind. The next year it will produce red clover with blossoms, all of which can be utilized by the hive-bees, and by saving seed each year from the first crop the long tubes will be automatically weeded out.

Tim Cans vs. Barrels for Honey.—We think most of our readers are aware that we strongly favor tim cans for holding honey. And we have not come to this conclusion hastily, but after considerable experience with handling honey in both kinds of packages. We are free to say that we don't care to handle any more honey in barrels, no matter what the grade of honey is.

Some of our good friends in Wisconsin—which, by the way, is a great barrel state—enjoy opposing our stand on the can, of course doing so in a good-natured way. But it is our turn now to refer them to the following, by Elias Fox, of Wisconsin, which appeared in a recent issue of Gleanings in Bee-Culture:

I can truly indulge all that was said in favor of tim cans as against barrels for the shipment of honey, at the Chicago convention. I have had quite a little experience along this line myself, and have decided never to use a wooden package for extracted honey again. I began putting it up in wooden packages with wooden hoops; and I found by letting them stand a short time the hoops would loosen up, and, unless watched very closely, and hoops tightened, there would be a leak, so no matter how good the coopage; and, even in shipping, the hoops would loosen.

Then I had my cooper use iron hoops, and my experience was the same, by letting the packages stand for any length of time, notwithstanding we selected the choicest and most carefully seasoned staves and the coopage was perfect; and the packages were made up a year before using, and kept in a dry place and a little heavy, no almost invisible knots, no larger than a pinhead. Of course, so far as the loss was concerned from leaking, it was nominal. But if you count the amount of honey absorbed by the wood, and the leakage together, it would equal, if not overtake, the difference in the cost of the two packages.

Then, again, think of the nasty, sticky packages to handle, and hands and clothes fumbled with it; and barrels are in this condition, and rolled along, as advocated, dust and dirt will stick to the leaking spots, and make an unsightly package aside from souring depot platforms and car-builds, to attract bees, flies, etc.

The barrel side of the debate say if a case is dropped, the soder will brown, and a leak would result, and that the cans are too widelv and too heavy to handle. A man should not be so awkward as to drop a package. But suppose he is, and the package should be a barrel. Also, the hoop of the wooden barrel goes in and out the can, and it will burst open, which would leak the worse. To the cans being a little heavy, I might say they are; yet I have moved, alone, 5,000 pounds in two-cans cases in a day; had ten rods to carry it to the
wagon, two miles to bind it, and piled it up five cases high, and my consultation paid me for the extra work in knowing there was not a drop of leakage, and no booj to bunch while I slept.

We can not be too neat in handling and making neat, everything to be done in a short space of time and to look as good as we can. My new 18-pound cans, and I will guarantee my honey to reach any market in such a condition as will not need cleaning in the market. I have found them, and no loss from leakage or absorbing. If we use a cheaper package for dark honey, there are plenty of them in all the cases and cases to be bought as cheaply as barrels.

We welcome Mr. Fox, to the tin-can side of the debate; and if he will be present at the Madison meeting of the Wisconsin State Bee-Keepers Association, on Feby. 5th and 6th, next month, we (Mr. Fox, Mr. Hatch and ourselves) will simply 'do up' those wooden-helmed-barrels, like P.T. Barnum, Wilson, McNay, and others. Of course, we'll treat them square, to be sure, but will see that they don't roll any of their honey-soaked and leaky-dusty wooden barrels over us! We'll just 'honey-can' those boys so that 'they'll keep like any other kind of canned goods.

**The Case of Utter vs. Utter.**—As mentioned in a former number, we give this week something further about the celebrated peach-bee case of Utter vs. Utter, which came to its final issue before the jury of Benton, N. Y., Dec. 19, 1900. Gleanings in Bee-Culture contains quite a full report of the trial, from which we take the following, written by Editor E. R. Root:

The case was a peculiarly hard-fought one; and was no ordinary case. The bees were placed on both sides by the plaintiff in a very practical way, in a beehive in the front room of a farm, and the bees were fed on the same side as their handles. Need I say that the National Bee-Keepers Association took an active part in this case—-one that was in the very life of bee-keeping in New York. It pledged 810 to Bacon & Merritt, two of the leading attorneys of Orange County—lawyers who have been retained in some of the most important cases that have been tried in that vicinage.

But, the bees, as the witnesses testified, and some queer statements on the part of the witnesses for the plaintiff, as to how the bees did and didn't do anything, and how the bees used their "horns" (antennae) to make holes, etc. In the lower court, several of the witnesses, I am told, got seasick from the "sight" of their "horns and legs" and "swung the fruit" when the bees had punctured the peach and put them in the trees. This was thoroughly in the trees. And, if this was the case, these trees were going to die, and the trees would have to put them up, and this was before the bees are allowed to have visited the fruit.

I do not need to rehearse here the testimony that was introduced by expert bee-keepers, but I can not omit reference to the testimony of Professor E. C. Brandes, Entomologist, Department of Agriculture, Washington, D. C. Prof. Benton had been sent by the National Bee-Keepers Association to render expert testimony on the mouth parts of the bees, and he certainly was the star witness for the defendant. He was a splendid witness and dead specimen of bees, and also charts which he had brought for the occasion, that in his opinion would put an end to the idea of the bees being to puncture fruit with their mandibles or jaws; that the bees of jaws were very different from that of the"bees of their kind". He chloroformed some bees and then past them around to different persons. The bees have obtained consent from the court to do so. He showed them that the delicate tongue, so far from being a "beetle's" which is used to puncture a sound piece of fruit, was more like a canele's hair; that it would be absurd to suppose that they would be used on the skin of any fruit. He admitted that bees could tear by picking away at fiber, but denied the possibility of doing much damage to the skin of any fruit. The jaws or mandibles, had smooth rounding edges, which, he showed by charts, were different in the case of bees and the jaws of bees would have to be brought to a temperature of about 90 degrees before such work could be performed. The professor's testimony, so far from bearing evidence of prejudice, was what might be termed in legal phraseology, "candied," the kind that weisgins with a jury. There was no evasions, and no attempt on his part to make a "testimony of the wrong of the bees. When asked whether he regarded the experiment of confining a few bees in a box with a peach as "nonsense," he replied that he could not or could not puncture sound fruit, he said, that in his opinion, it did not count for much, as he had seen in a box with bees that were able to go out of doors. He said yes, in very good order. This testimony was produced, probably, to show that the trees did not have much damage, and to guard the plaintiff by the defense. But Mr. Bacon, in his final plea before the jury, called attention to the fact that his trees had been destroyed, and that now they were good and sound, and yet be desired compensation for the trees which he at first said were destroyed! Mr. Bacon made a strong plea, picking up all the important things of evidence and pointing them at the jury in a most forcible manner.

The attorney for the plaintiff, while he did not make the testimony against the bees, turned his guns upon A. L. Root, shaking his fist in his face, and calling him the great "bee-fool" of the west. We do not intend to relish the compliment; but the rest of us enjoyed the joke immensely, and I hope the Bee-Foolers of the west will not take the compliment amiss. We consigned A. I. by saying that it signified something big, and told him not to feel so proud.

Of course, no one could tell absolutely what the jury would do; but it seemed to be made up of a "fruit man," and that faces, of a lot of intelligent, thinking men.

The judge, in his charge, rehearsed very carefully the points that he believed that the bees were responsible; and, then said that the jury, in order to render a verdict for the plaintiff, must find that the bees in fact proved that the trees were killed by the trespassers; and that it (the jury) should further give very careful consideration to the habits of the bees, and in about ten minutes returned with a verdict of "no cause for action."

The National Bee-Keepers Association exerted a powerful influence in the case, in that it enabled Mr. Utter, the bee-man, to employ outside counsel on either side, and no lack of witnesses; but, thanks to the Association, we were able to show that the evidences adduced by the plaintiff was, for the most part, to put a most charitable construction on it, founded on misapprehension, ignorance, and the mistakes of the bees. There is no doubt that some witnesses for the fruit-man actually believed that the bees did more good than harm. They are, in fact, "bees of ill-sorts." If they did so believe, and if they heard our evidence, their belief must have been most severely shaken before they went away.

**The Delays and Interruption to our business, occasioned Jan. 1st by the water poured on the fire above our copy of the Bee Journal.** By another week we hope to know just what and how much of the Bee-supply stock was damaged by water. Some of it is a total loss, some slightly damaged, and some still in good condition having been well protected with tarpsaul covers.

We are not anxious to have another such a disturbance; but if it should happen, we will "settle the dust." it also quite as thoroughly unsettles things too much. However, these events bring home to the common man and we perhaps are getting only our share.

**AMERICAN BEE JOURNAL.**

Jan. 17, 1901.
The National Bee-Keepers' Association.

General Manager Secor's 4th annual report was sent to members of the Association last month with a voting-blank for the election of three directors and general manager. Mr. H. F. Moore and the Editor of the American Bee Journal were selected as the committee to receive and count the ballots. The result will likely be known in time for announcement next week.

In order that General Manager Secor's report may have a wider circulation we give it here:

**FOURTH ANNUAL REPORT OF THE GENERAL MANAGER OF THE NATIONAL BEE-KEEPERS' ASSOCIATION.**

*Forest Cty, Iowa, Dec. 11, 1900.*

*Fellow Members,—* At the last annual election the general manager and directors, Dec. 5, 1899, the question of uniting the two National societies was submitted to the members of both organizations, and the new constitution, which slightly changed the name of our society, was ratified and endorsed by a large majority of both old societies. It is therefore gratifying to report that what some thought to be two rival associations with similar aims have united, and the loudest interest augurs well for the now-named "National Bee-Keepers' Association.

There is no doubt about the usefulness of such an organization, if properly managed. The question of its efficiency under the present management is pertinent, and every member may rightfully express his confidence of this critic when he approves the present manager's report.

The present manager does not pretend that his judgment is infallible or that the efficiency of the organization can not be increased by other management than his own. But this must not do, because he has honestly and faithfully discharged the duties imposed to the best of his ability.

The board of directors and all other officers of the Association have heartily co-operated with the general manager in the business in hand, and therefore entire harmony prevails and a perfect spirit is noticed.

The kind and appreciative words received from time to time from members of the Association and friends generally are prized beyond compare. They are like sweet flowers found in desert places where one expects to find the hard thorns of bitter opposition. It is easy to labor when one is cheered on by encouraging words.

I have not in every instance been able to help those who have appealed to me. Some cases have been too hard. For example, it is not possible to collect a bad debt if the debtor is bankrupt and execution-proof, with no disposition to pay. Dishonest honey-dealers will sometimes evade their debts and escape punishment just as a thriving bank-teller will occasionally squander the savings of depositors and go scot-free. The suggestion is here emphasized that it is better to look up the financial rating of every man who buys honey, and the honesty of every commission man, before making a contract, rather than try to recover a bad debt hastily accepted.

**The Case of Utter vs. Utter.**

Several months ago, in the County of Orange, New York, two brothers fell out, the one a grower of peaches and the other a bee-keeper and member of this Association. The peach-growing Utter sued the bee-keeping Utter before a Justice of the Peace, and asked for damages done to plaintiff's peach-orchard by defendant's bees. The case was tried, and after a good deal of damaging evidence was introduced by the plaintiff, and astounding revelations as to what bees can accomplish, one of the bees disappeared, and the judge decided against the bee-keeper and assessed him $25 and costs. While there was a lack of competent evidence that the bees were guilty as charged, it seems that the fruit-growers had the sympathy of the court.

The case was sensationally written up by reporters and the matter was given wide circulation thr thr many papers. The coloring given to it was generally against the bee-keepers.

The Rural New Yorker, however, used its influence to show that bees are not guilty of injuring sound fruit. But a letter from its editor, besides communication from many bee-keepers, convinced me of the alarm that was felt if this decision should stand. A great deal of the information which I was able to give the public was in the future it was feared that other bee-keepers might suffer. The general manager, therefore, with the concurrent judgment of a majority of the board of directors, ordered the case appealed to the county court, and it is proposed there to try the case over again on its merits, with enough expert witnesses to get the facts before the jury.

Mr. H. F. Moore is an able man, and, as in the judgment of the general manager, the matter was one which had to be fought out sooner or later in the interest of truth and justice, he pledged $100 toward a favorable verdict. The Association will be glad to list the names of several expert witnesses while attending the trial. The results can not be ascertained in time to go into this report.

**Bees and Horticulture.**

During the past year the general manager has compiled and published a twelve-page pamphlet showing the value of bees as pollinizers and fruit-producers. This was thought to be a necessary because ignorance is believed one of the part of orchardists relating to the work done by insects in their interests. Spraying is becoming more and more common. When to spray and what preparations to use are shown, quoting competent authorities. Laws of several of the states in relation to spraying are also quoted.

This pamphlet has been forwarded to several members who feared trouble from neighbors who threatened to spray with poisonous substances while trees were in full bloom, and it is hoped and believed that this timely publication has had a sedative effect, being the result of a heavy protest to this office of damage done to bees by spraying where it was distributed. It has always been my policy to try to prevent law suits rather than to win them. If by educating the people who respect each other's rights—it is better than winning victories at the end of bitter legal battles.

The above pamphlet was sent to several agricultural and horticultural journals and in every instance was favorably noticed.

**The Fight for Pure Honey in 1899.**

It will be remembered that the Association put up a fight against adulterated honey in Chicago last year. A statement of this matter was in my last annual report. While the outcome of the suit was not satisfactory to us at the time, later developments seem to indicate that it was not an isolated case. The following extracts from Gleanings of Sept. 15, 1900, may be of sufficient interest to warrant copying here. It is as follows:

"At the Chicago convention we had the pleasure of hearing Prof. E. N. Eaton, chemist, and Commissioner A. H. Jones, of the Illinois State Pure-Food Commission. Both of the gentlemen express themselves as being highly pleased to meet so representative a body of bee-keepers as assembled for the purpose of discussing ways and means for purifying the honey. They told how the work they had already begun; how they had compelled the dealers throughout Chicago (the very hotbed of adulteration only a few months ago) to sell all food products under their legitimate and real name. Some of honey mixtures contain a word 'pure' which has never appeared in the place to conform to a recent law enacted at a session of their last legislature. All kinds of honey, if they are sold at all, have either been relabeled or else the word 'pure' has been scratched out and the word 'imitation' in bold letters put in its stead.

"It will be remembered that the United States Bee-Keepers' Association, under the direction of General Manager Secor, and thru the personal efforts of George W. York and Herman F. Moore, (a well-known honey-man and an attorney,) gathered up, a year or so ago, a number of samples of honey and other products and before the city prosecutor, and certain suits were begun against the vendors of the samples. It created quite a furor among the dealers, for the Chicago papers were full of the matter for the time being and altho the suit resulted in a verdict of "not guilty" for one of the parties on a queer sort of technicality before the justice, the result of this prosecution, while apparently a failure, was a far greater success than the Association could have hoped for. Prof. Eaton and Commissioner Jones stated before the convention that the suits begun by the United States Bee-keepers' Association made such a stir in the city that it helped in no small degree toward the enactment of the new law against "false labeling."

"I wish to acknowledge the hearty co-operation of the Division of Entomology, Department of Agriculture. Mr. Frank Benton, assistant in the Division, has rendered valuable service by replying ably to enquiries directed to the
Department on the subjects relating to bees and fruits, and has put into my hands copies of correspondence in several instances where litigation was threatened, which but was averted by prompt and prudent action.

Carlisle, January 3, 1897. Mr. Abbott was reported to the entomological Division stating that the city authorities proposed to pass an ordinance prohibiting the keeping of bees within the city limits and for four miles outside. The matter was referred to me, and such literature as was available was forwarded for the attention of the beekeepers, and they were also referred to McLain’s experiments. No doubt the matter was dropped by the city, as nothing further was heard of it.

Several other cases have been reported to me during the past year, of cities and towns threatening to rule the bees out, but copies of the celebrated Arkadelphia decision sent, no doubt had a restraining influence.

The general manager has written more than a hundred official letters during the year, besides horticultural copies sent the directors at different times, and besides the regular routine of official notifications and receipts.

Many of these letters have been lengthy legal opinions in answer to members who have been threatened with lawsuits.

The Association sent Mr. Abbott as delegate to the Third annual convention of the National Pure Food and Drug Congress, which convened in the city of Washington, March 7, 1897, and paid a small portion of his expenses. The object of this trip was to add interest of purity and honesty of all foods and medicines consumed by man. It is laboring for the enactment of laws to protect innocent purchasers from deceit and fraud. The board of directors believe such efforts worthy of aid.

THE HAKES ADULTERATED-HONEY TRIAL.

January 22, 1900, Secretary Dr. A. B. Mason, at my request, forwarded copy of agroceryman at Jackson, Mich., who had been arrested by the State Food Inspector on the charge of selling adulterated honey. The suit was in the circuit court of Jackson county, and it appears to have proven beyond doubt that the honey offered for sale by the accused, Mr. Hakes, was largely adulterated with glucose syrup. The court instructed the jury to return a verdict of guilty, which was done. I have no doubt that this trial will have a wholesome effect in Michigan and in all other States where pure-food laws are in force.

If impure extracted honey can be driven from the market, and consumers led to believe that what they buy as honey is really the product of the hive-bee, a better price may be realized by the producer of a first-class article. It may therefore be well at this critical juncture of the commercial season to call the attention of the beekeepers to the case of Mr. Hakes, and to encourage a demand for pure honey. A good single-lift honey ought ever to be offered for sale.

In conclusion I wish to admonish our members to keep out of trouble if possible. Don’t get the idea that this Association can do everything. Beekeepers must keep within the law if they wish to have the protection of law. Bees may become trespassers like other domestic animals, and beekeepers may be liable for damages done by bees in some instances. It is therefore wise to avoid any conflict with near neighbors which your care can prevent. Infuriated bees in a thickly settled neighborhood may bring legal contests which this Association can not win. The Golden Rule is the highest law.

EUGENE SECOR, General Manager.

Mr. Secor closes his report with a financial statement showing a balance on hand of $53.15.

The Association has numbers 560. It is unfortunate that so large a number of beekeepers have not yet discovered the personal benefit and security there may be for them in uniting with the National Bee-Keepers’ Association, yet it is pleasant to know how much has been already accomplished by organization, and the present number of members gives hope that it may continue to increase. There ought to be a large gain in membership with the beginning of the new century, and now is a good time to act.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for $1.10.
these goods are only too willing to use that to assist them in selling the product. One of them is called, I believe, "Malt Honey." There is no honey in the preparation at all. There is another name for it; they don't care to call it by that name; they would rather call it by the name of "honey." That company has been asked to leave off using the name "honey." It is probably the only sample of that preparation, that is labeled "Honey Syrup." There is no honey in that sample, either, and that was taken by one of our regular inspectors out over the State, and since the law went into effect. The word "honey" has been scratched off. We hope to prevent the use of the word honey altogether on the goods which do not contain honey, unless there is some honey in the preparation, or unless the word "Adulterated" accompanies the word "honey." Of course, they can use the word honey if the word "adulterated" appears in large letters equally as prominent.

Mr. Green—I have seen honey on the market which was labeled "Imitation Honey," with the word "imitation" very small type, and it was not in any law?

Prof. Eaton—No, sir: that does not comply with the law. The law requires that the word "adulterated" shall be in large and conspicuous type. I have noticed that myself, but the company that has been putting out the most of it in this State intends to use the word adulterated. This indicates you the way it should not be, but it gives you an idea of the way the law requires it to be labeled "Adulterated Honey." You will notice they put this [indicating] small type on a package that looks very hard to practice not to show up as well as they ought to. Hereafter they have agreed to put on better letters. This is the label the gentleman referred to, probably, where the word "imitation" occurs, and you will notice it is in prominent letters: that is illegal. It will be hard to prevent, I presume, the use of the word honey in the way I have spoken of, because it will be impossible to apply the same principle to other goods. For instance, selling coffee, where the word "coffee" is used on the can; that word is so commonly used and there is so little fraud in it, perhaps there is no great objection to its use. A little more objectionable, perhaps, are the words "Fruit Cocoa" which some of them are using. I am very much obliged to you for your kindness. [Applause.]

Mr. Abbott—I want to call attention to the statement on the label. I want these bee-keepers to see how people trade on that reputation, and the check and gal of it. This reads: "With this preparation is free from the deleterious properties of this and similar sweets,"—free from the deleterious properties, it says, of honey. I wish some of you would tell us what deleterious properties of honey are. The people who are producing that article say that honey is free from the deleterious properties of honey; if there is anything on God's earth that honey would hurt, I would like to see the thing.

It seems to me the world is moving when the time comes in the State of Illinois, and perhaps in Chicago, that they have come to the point they are scratching out the word "honey" when it is obviously on a can of bogunstuff. We are making progress, whether the National Bee-keepers' Association can do anything to do with it; it may have had some little influence.

Prof. Eaton—It had a good deal.

Pres. Root—It is encouraging to think we have done a good deal. I would like to have that thing photographed, that word "honey" being crossed out, compelling the people who sell goods under their own names. The committee on resolutions will now report.

REPORT OF THE COMMITTEE ON RESOLUTIONS.

Resolved, That this Association urge upon the Congress of the United States the importance of enacting into a law the House Bill known as the Brosias Pure Food Bill; that we would impress upon the individual bee-keepers of the United States the importance of addressing their Senators and Representatives, asking them to give their support to this bill.

Resolved, That the thanks of this Association are due, and are hereby heartily tendered, to the Chicago Bee-keepers' Association for its success in soliciting the efforts of their Senators and Representatives, asking them to give their support to this bill.

Resolved, That the thanks of this Association are due, and are hereby heartily tendered, to the Chicago Bee-keepers' Association for its success in soliciting the efforts of their Senators and Representatives, asking them to give their support to this bill.

Resolved, That the president appoint a committee of three on legislation, looking to the securing of uniform laws throughout the honey-producing States, touching such matters as are of interest to bee-keepers, such as the eradication and prevention of contagious diseases of bees, and the prohibition and punishment of adulteration of honey, and the injuring of the honey-producing States, touching such matters as are of interest to bee-keepers, such as the eradication and prevention of contagious diseases of bees, and

Orel L. Hersher, Emerson T. Abbott, Committee.

R. L. Taylor.

The resolutions were adopted unanimously.

Mr. York—I would like to propose that this body extend an invitation to Commissioner Jones of the Pure Food Commission to attend our session to-night, and Mr. Moore be delegated to notify him, and come with him.

The motion was unanimously carried.

Mr. Burnet—I understand a communication came from Dr. Miller, explaining that his absence from this convention is caused by his sickness, and death in the family. I moved a telegram be sent acknowledging his letter, and sending the regrets of this convention and the hope for his speedy recovery.

The motion was carried unanimously.

Mr. Benton—I want to bring before this body a question which will perhaps require the president to step down from the chair a moment, and may I ask Dr. Mason to take it? He ought to have done so last night. I proposed last evening a vote of thanks for him, for what he has done in providing such fine stereopticon views and also his brother, Huber Root, who also assisted him. Mr. Root was so modest last night he would not put it, and Dr. Mason was so deaf he could not hear, so I now move that the thanks of this Association be tendered our friend Ernest Root, and his brother, Huber Root, for the splendid entertainment they have furnished us in showing the stereopticon views that we have had.

The motion was seconded and unanimously adopted.

Dr. Mason—Mr. President, I am a little bit slow on resolution matters, but I want to have the Committee on Resolutions put in one thanking the Chicago Association for their splendid effort in the direction of doing away with adulteration of honey in Chicago. Some of us know they have been in dead earnest and thoroly at work in this respect, and I offer that as a resolution, to go with the others.

Pres. Root—Have you one to offer now?

Dr. Mason—Yes.

Resolved, That this Association thank the Chicago Bee-keepers' Association for the splendid effort it has made and congratulate it on the splendid success it has met with in fighting the adulteration of honey in Chicago.

The resolution was adopted unanimously.

Continued next week.)

Contributed Articles.

BY J. M. BANKS.

The question of double and single walled hives has been a matter of discussion for many years, and there have been strong arguments on both sides. To determine for myself the value of protection from the direct rays of the sun during the honey-flow, the following observation was made.

In 1900, five 8-frame dovetailed half-frame and five 8-frame single-walled dovetailed hives were watched. The entrances on all the hives were 3½ x 12 inches and all were fitted with one super each. The single-walled hives were fitted with a flat board cover, while the half-frame hives were covered by a telescope cover having a ventilator in each end and an air space of about 2½ inches all around the super. There was no noticeable difference in the strength of the colonies. All were equally exposed to the sun and all hives were painted white.

In the morning the bees were working freely in all the super, and no difference could be detected.

At 9 o'clock the thermometer registered 89 degrees Fahr., in the sun, and the bees were all working the same as earlier.

At 10 o'clock the mercury had reached 94 degrees and the bees were still working lively.

At 11 it had warmed up to 96 degrees and the bees were beginning to cluster around the entrances of the single-walled hives, but were still working in the supers.
At 12 o’clock the column of mercury stood at 110 degrees and the bees were beginning to cluster a little around the entrances of the chaff-hives, and had formed a cluster of nearly four feet from the front of each single-walled hive. No difference could be seen in the height of the chaff-hives from their appearance when first opened in the morning. Those on the single-walled hives, however, were comparatively quiet.

At 1 o’clock the thermometer registered 111 degrees, the highest for the day, and the conditions of the inside of the hives were practically the same as an hour before. There were a few bees above the entrances of the chaff-hives, while the whole floor of each single-walled hive was covered with bees. The conditions remained the same until toward evening, and no more work was done in the sections on the single-walled hives that day, while the bees in the store hives continued to store honey in the surplus cases all the afternoon.

Altho one experiment will never absolutely prove anything, it would seem that if hives containing bees must stand in the sun, it would be a paying investment to see that they are in some way protected from the heat.

No. 3—Extracted-Honey Production.

About Getting Stores in Proper Shape For Good Wintering—Brood in Extracting-Combs a Help at the Beginning of the Flow—Manipulating Extracting-Chambers to Discourage Swarming, Etc.

BY R. C. AKIN.

In the previous article was discus the size of hive and effect of conditions upon the strength of the colony and swarming. We learned that a larger brood-chamber was necessary for an extracted colony than for section honey, over the whole of the hive was used, more care and feeding for winter and spring. I showed you that some seasons and localities would change the conditions, and I will further illustrate. Suppose the flow closed in June or July, and you have taken off the surplus combs, shutting down to the brood-chamber. If so, and there is a little honey gathered—sufficient to stock the brood-chamber—your colony gets in condition for winter; but if the extracting-combs are left on till all late honey is gathered, then you may still expect the honey to be almost all in the super, if the colony is strong. A weak colony would store in broods-combs more. Also the size of the brood-chamber makes considerable difference in some things, and as well more or less free communication between brood and super.

Suppose the scouts and the extracting-combs are all worker; after the main flow is over when you extract, a very good plan is to take one extracting-chamber and place it under the brood-chamber. You may ask why under, arguing that if on top it will catch the honey as it comes, and saves lifting the brood-chamber. You are right so far as that applies, but you stop too soon. Place the extra on top after the main flow is over, and if there are enough bees they will occupy the extra, and if the weather is warm and some honey comes in, they will be after putting it into the extra. More than this, if there be a vigorous queen, and especially a young one recently begun laying, together with a light flow and warm weather, not only will those bees which flow from the fields, but other previously stored below be moved up to allow the queen to lay freely. Remember that strength of colony, age of queen, temperature, nectar coming in, etc., intensify or diminish the storing above.

But here is another trouble with that extra on top instead of under: Leave your colony thus to go into winter, and before, or by early spring, at most, the colony shifts upward into the top chamber. Once the cluster is established at the top, there is little use of one or two stores, and they may not go downward for honey, your colony would perish by starvation. I know this by actual experience. If the extracting-combs are to be given when the flow is probably over, put the extra comb between the hives, and put it into the stores, in which may be stored later is crowded in close above the brood, and thus the stores are made more instead of less compact. The large wintering of a colony is very materially aided by a very compact condition of stores, and the stores very close to the cluster. In extreme cold there ought to be honey within or very close above the cluster. Placing the extra under gives room for the colony to cluster down as much as they please, without fear of being crowded upward only just enough to let the honey in above the brood.

But what about getting brood in the extra if under? Well, unless put there very early in the fall it is not likely any brood will be put in it; but if there should be some in the stores, you can put them in the stores, and you will be there until the colony becomes quite strong. But what if there is some brood in the extracting-combs just before the flow? It is one of the best things that can happen. Rearrange the honey in the comb so as to make a division between it on a queen-excluder, and the extra with its brood on top. This will cause the colony to occupy the entire hive, and being stretched so are less likely to get the swarming-fever. This very arrangement—helping to give the weak, storage of whatever honey comes in from the very start to be put in the extra, thus the queen has the brood-chamber to lay as much as she pleases. As soon as storing has well-filled the extra, lift it and place a fresh chamber between it and is directed to get the honey in the extra, leaving the queen full swallows. This will almost extinguish swarming in most seasons. It will also leave the colony again without winter stores unless the extra can be put beneath, or a late flow fills up after the extra is off.

I believe there is no better way to keep extras over winter and spring than by this method of placing them under the colony. It makes the stores that may fall away from the cluster; it protects the combs, and it also protects the colony against robber-bees. Of course I am speaking of outdoor wintering; if bees are cellared they do not need so much room, or is it so imperative that stores may be in very close proximity to the colony. I am sure that for best results stores should be very compact and close to bees all the time, both indoors and outside.

This kind of management anticipates only worker-comb in the extracting-chambers, at least in such as are put beneath the brood-chambers. A drone-comb there in late fall or winter, even in early spring, makes no difference as it would not be used; the time trouble would come be in the last two or three weeks just before the summer flow. The extra may be put on top when the colony has become strong enough to desire and use drone-comb, using an excluider between; but the objection to this is that there is so much extra care needed. It would be so much more simple, and a great saving of care and time. If every colony can be left as they are with their-two-story hives until the flow is just on, when one job can be made of the entire yard, in rearranging hives. There is also this in favor of all remaining as they are till the flow is on—the operation of making the stores swarming-chamber, the honey in the chamber, and that if preparations for swarming have been begun they would be discontinued. Every colony should be inspected to know if swarming is already anticipated, and cells cut from two-hive that the possibility of swarming.

I will add here, parenthetically, that if any queen is failing—and weakly ones will (many of them) be at about this time—you will discover it. If there has not been enough nectar coming in to encourage to swarming, the colony that has cells at this time, just at the opening of the early summer flow, are preparing to supersede. If the number of cells built run from two to five six, it is a strong indication of supersEDURE, but if the colony is of good quality and strong, and the hives are past prime, I am thinking this, you can well understand that if you have only young and vigorous colonies there will be much less swarming. A colony having a vigorous queen, stores normal, and room for nothing in the stores from the fields, will have little tendency to swarm until the season for swarming with its encouraging conditions arrives; but aged or feeble queens may be expected to swarm under quite less favorable conditions than young ones swarmed with.

I would not think of producing extracted honey without queen-excluders—they are necessary to confine the queen lest there be brood in the extras when not wanted there. A little brood just before the flow begins—say a week or a little more—that it be all sealed—serves as the put to of the colony up to work there, yet does not interfere about extracting. An extra having brood in it when ready to come off for extracting, is much harder to get the bees out of.

It is well to give special attention to this matter of having the stores in close, compact shape for winter, especially in outdoor wintering; it makes a colony winter more safely, and build up better in spring—more safely because stores
are easy of access, and because if brood is closely bound
with honey some of that honey will be moved to get it out of
the way of the brood-nest, thus better feeding of queen
and the brood results, that would not otherwise be obtained ex-
cpt by a flow of nectar or by feeding.
If the foregoing management be applied in an intelli-
gent and scientific manner there can be no doubt of good
results. And, as it is only necessary to see the hive plan in
the spring and early summer, the greater the necessity
of the better preparation and obtaining of the con-
tions relating to stores and strength of colony for winter.

The Afterthought.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

FINISHING A QUEEN BY FANNING BEES.

Yes, sir, I guess McNeal has a bright, new idea for us.
It is according to the probabilities; and if he has tested
the matter and found it correct it is worth while for us to test
it too. If Queen Victoria was at your house, and you had a
movable mechanical arrangement for cooling off things in
sultry weather, the mechanism would be run right straight
to the room she was in. So first look at the fanning bees
outside the hive when you go for a queen in fanning weather.
Page 792.

PROPOLIS ON FLOORS AND BOOTS.

That parasite, or incubus, or stick-tight-ibis on the bee-
man's sole—who has not worried his brain more or less for
some scheme of relief? Propolis scraped off must needs fly
somewhere to a fly crepe place and when a boil
steps he has annex a lot of it—annex it on constitution-
follows the flag principles, too. Mr. Wilcox, page 793,
seems to think that down in a cool cellar, which has moist
sand only for floor, he can trap around on propolis scrap-
plings and not have them follow him off. Don't more than
half believe he can do it as a regular thing—may be he can.
Those of you who can rub in a dram of enthusiasm and a
few scoops of faith-cure into the ointment may try it—
remedy worth something if you succeed. I scrape sitting,
hold feet still, keep a broom in reach, and sweep me a path
before rising. How is it, brethren? Which way is ortho-
doxy, and which way is heterodoxy? and who will come
with a better-odd don't.

WIRE-RING THE QUEEN.

As to capturing the queen, the wire ring to surround
her with suddenly, and lift her up when she steps on
it, will be new to many of us. Quite a number of trials we
may need before fully deciding about the exact value of it,
but it may be that we shall decide that it is very great
help in that line of work. The idea is capable of modific-
atations; and it may be that it will yet be improved quite a bit
from the way McNeal has it. Page 792.

CRUDE PROPOLIS AS A MARKETABLE ARTICLE.

I think I should look out for a trap, or a swap, or a rap of
some kind, if a man wanted to buy crude propolis of me
for 50 cents a pound. Price much above the cost of obtain-
ing it, and rather a few propolis amounts on the cost of similar
articles. As to this I put myself over the cost. When I
resins before saying that? Anyhow, if a man came around
and wanted to buy the waste dish-water of your kitchen at
5 cents a gallon, you'd let him have it; but if he proposed to
pay for it at 5 cents a gallon you would postpone things until
you could form some opinion as to what the fellow was
really up to. It wouldn't be easy for any one apiary to fur-
nish great amounts of propolis; but section scrapings, to
the amount of quite a few pounds, could be furnished cheaper
than that. We have more to waste it than it would to save it—it
has such a won't-be-peaceably-wasted disposition. Those
of us who use the wide frames to hold secretions can get a
few good pounds and keep them in a place (usually in the honey season) by
scraping our frames. Page 790.

TWO BAD SLIPS OF THE PROOF-READER.

Seems to me the proof-reader must have been making
New Year's calls shortly before he read the last After-
thought. Butter is sold, not "said," and the anti-progress
monster was fought, not "bought." Nobody not already
in his claws would ever buy him. Page 11.

A BEE AND FRUIT PAMPHLET NEEDED.

A little pamphlet which is not yet in existence was evid-
cently what that legal man on page 803 needed—"The Hab-
bit of Bees in General; Fruit Irresistibly Stated by Au-
thority." It should be gotten out by some government ento-
ologist, and be reviewed and endorsed by Uncle Sam's head
fruit-man. Then lawyers (and courts, too, to some extent)
would accept it. You see, we're all apt to state things
pretty strongly on our own side—and if we didn't we would
be suspected of doing so so sharply that our pamphlet
wouldn't count much.

THE ITALIAN BEE "NOT THE WHOLE THING."

In Mr. Dadant's letter, on page 806, I was particularly
interested to see that Swiss bee-keepers (as well as many of
the British) do not give the preference to the Italian bee,
ly and by the whole actual fact about races of bees will get
to the surface; and it is quite possible that the best bee for
one locality will not be the best bee for another locality.
Bees that could be depended upon always to crowd the queen
with honey, and check her laying in times of plenty, would
be very desirable wherever there are all the one short flow;
but where moderate flows are scattered all thru the season
such bees would get so weak as to be worthless. And the
Italian is the worst of a queen-crowder that we have. I be-
lieve.

Mr. J. B. Hall, of Canada.

The man whose portrait we are permitted to present on
the next page, is one of Canada's very brightest and
best bee-keepers. We had the great pleasure of meeting
Mr. Hall at the convention of the National Bee-keepers'
Association held in Toronto, Ont., in September, 1895—the
last convention which Father Langstroth attended.

Editor H. E. Hill, of the American Bee-Keeper, was at
one time an apiarian pupil of Mr. Hall, and to this day takes
much pride in that fact, as well he may. Recently Mr.
Hill had this to say of his former teacher, in his paper which he so ably edits:

We have pleasure in presenting in this number a most
outstanding portrait of Mr. J. B. Hall, of Ontario, one of
the Dominion's acknowledged leaders in things apicultural.

While Mr. Hall is a very earnest and popular associa-
tion worker, it is to be regretted that, for some years past,
all persuasion and force, in their oft-repeated applications,
have proven inadequate to the purpose of eliciting from his
pen contributions to the bee-keeping press. This is the
more to be deplored when we consider the fact that Mr.
Hall's pen productions have a style at once interesting and
instructive, peculiarly methodical and painstaking bee-master than Mr. Hall can not be found—
more a successful one. Too many futile efforts have
steadily been made to remove the "bushel" in which so
much "light" is confined, to leave any hope for the future
in that direction; but, were it not for the profound respect
which we feel for this esteemed instructor of our youth, we
should not hesitate to suggest the trial of a quicker method of
publishing his "jottings." This might be done more equa-
ly effectual, and we shall neither try nor recommend the kick-

Mr. Hall is a producer of honey, and, being such, he
says he has nothing but honey to sell. His favorite bee for
the production of comb-honey is an Italian-Carniolan cross,
of which he has an excellent strain. He is the originator
of the thick top-bar and of the wood-zinc excluder; too
modest to assert his right to the honor.

In the conduct of his business, Mr. Hall's operations
are governed by attendant conditions and their immediate requirements, from the standpoint of independent reason, and not according to any set of stereotyped rules, as is too frequently the case with bee-keepers. He is, obviously, a case of "the right man in the right place," and there is ample evidence on every side, of the wisdom of his choice in adopting apiculture as his profession.

At the present time a week seldom passes in which we do not have occasion to recall some of the advice and admonitions given with his characteristic earnestness and kindly manner, 15 years ago, when he labored to eliminate the erroneous ideas which we had previously acquired, and to establish in their stead a clear understanding of what they appeared to be a most obscure subject.

That our younger readers may fully appreciate the picture, we have pleasure in reproducing a few paragraphs from the Canadian Bee Journal’s report of the meeting of the Ontario Bee-Keepers’ Association, held at Toronto, in December, 1899. Mr. McKnight’s motion was evidently a spontaneous outgrowth of the same sense of obligation and high esteem to which every man is subject who has been intimately associated with the gentleman whom he sought to honor. It is a sense of obligation and esteem which, as we know by actual experience, constantly increases by long and very intimate association:

"Mr. McKnight—There is a little matter which I would like to bring up. We have a gentleman with us during this convention who is here only by the solicitation of a great many members. This Association has been a great success right from the first until now, and that is something creditable. There have been men who have done more than Mr. J. B. Hall has for this Association in a purely business way, but I want to tell you there is not a man belonging to this Association now, or ever did belong, who has made its meetings so interesting and practical as our friend Hall. [Applause.] He has been the life and soul of our Association meetings for the last 19 years. Like myself, the world is largely behind him; he has not many years to be here, and I think it would be a graceful thing to do anything in our power to show our appreciation of the value of his services. Altho he does not say very much outside of this Association, Mr. J. B. Hall is known all over the continent of America. I would like to move that this Association make J. B. Hall a life member—that is all. [Loud applause.] I would like, if it were in my power, to confer some higher honor upon him, but I know he does not want it; and I am not sure whether he would appreciate even this; but I know it is our duty to show Mr. Hall some mark of the appreciation of the valuable services he has rendered to the bee-keeping interests of this Province. I hope this will not be made a precedent; it would be very little honor if all the old men were associated with him; I would like to see Mr. J. B. Hall the one and only life member of this Association during my lifetime.

"Mr. Brown—I have very much pleasure in seconding Mr. McKnight’s motion. I can indorse every word he has said with reference to Mr. Hall.

"The motion was carried by a rising vote, and the singing of ‘He’s a Jolly Good Fellow,’ after which Mr. Hall briefly and suitably replied."

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper’s song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a gem. We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

Queen-Rearing is a very interesting part of bee-keeping. Mr. Doolittle’s book tells practically all about the subject. See the offer we make on page 30 of last number.

Questions and Answers.

CONDUCTED BY
DR. C. C. MILLER, Marengo, Ill.

The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Entom.

A Beginner’s Questions.

This is my first year with bees, and I would like to know how to keep them successfully. I want to increase as well as to work for comb honey.

We have cold weather and snow usually from Dec. 15th to March 15th. It has been from 5 to 10 degrees below zero here for 10 days, and lots of snow on the ground.

1. What kind of hives and supers should I use for best results?

2. I took the third frame of brood from an 8-frame dove-tailed hive last summer, and put it into a hive with foundation, in order to get the swarm to stay, as well as to strengthen them. The colony was strong at the time with bees and honey. On examining, before I put them into the cellar, I was surprised to find how few there were dead, and I now have a colony with eight brood-frames of honey.
On removing the frame of brood, I brushed all the bees from it. What caused them to dwindle and die? 

2. Can I feel then the loss of honey by two weak colonies I have, or should I give them sugar syrup? I am wintering 20 colonies in frame and box hives.

4. I had five colonies last spring that gave me 20 to 30 pounds of surplus comb honey each. The swarms gave no sign of breaking up with one frame of brood and seven frames of foundation 3 inches wide. What could I have done to make them do any better?

NEW BRUNSWICK.

ANSWERS.—1. The kind of frame hive you already have is to be continued, unless they do some good reason for making a change, for it is a very troublesome thing to have two kinds of hives in the same apiary, especially if they have frames of different sizes. The size of frame most generally found in use is any, measuring 17⅞x⅞, outside measure. This is the frame used in the dovetailed or Langstroth hive.

2. Very likely they were queenless.

3. It will be all right to use the comb of honey, unless the bees were diseased, which is not likely.

4. If you all your honey from the old colonies, and none from the swarms. It may be that you would have had more honey if you had depended more on the swarms, putting them in the old hives for 2 or 3 days and then on the old stand, setting the old hive close beside it. A week later remove the old hive to a new location. That will throw the whole field-force into the swarm, and allow you to get nothing from the old colony, you will have a strong force in the swarm, and your total yield may be greater.

What Killed the Bees?—Other Questions.

The season of 1900 opened the best in many years, with a big flow from fruit-bloom, mostly from plum and wild cherry, the scales showing a gain of four to six pounds per day. Then the great drought commenced, which lasted until Aug. 4th. It was too dry for basswood to yield nectar. It was during that time that there was a daily rain. The stores from the spring-flow were about all gone, and it looked as if every colony would have to be fed, or starve. The rain brought an immense growth of weeds on the wheat stubble, and with a few fair days the bees filled their hives with the most villainous honey you ever saw, almost black, and the flavor was worse than anything I ever met with before. It was from what is called wild buckwheat—a vine that has a seed shaped like buckwheat. A few cold, rainy days followed, when the bees commenced throwing out dead larvae and young bees. Examining, I found frames of brood being uncapt, with not an egg or young bee alive. This was the case with every colony (about 24), and there was not a dead one, as the best of my knowledge, and I examined them frequently.

1. Now, the question is, what killed them?

2. Will they rear brood in the spring on such stores?

3. Will it be best to take away the honey away and feed as soon as taken from the cellar? They seem to be wintering all right, with no unusual number dying.

CENTRAL MINNESOTA.

ANSWERS.—I don’t know. It looks as tho that villainous black imitation of honey killed them. Yet from what you say they must have been living on the same stuff since, and it does not hurt them. It is just possible that they got something poisonous that killed them, and none of it is now in the hives.

3. Keep a close watch in spring, and if everything goes straight, and brood appears healthy, let it be; but if the brood dies, or there is no brood, then change the stores.

Spring Feeding—Two Apliaries or One?

1. Do you know of any objection to the following plan of feeding and strengthening a colony in the spring? Would bees object to the partial division of their home when in two hives? If not, would they be less likely to swarm, being on 16 Langstroth boxes? I am feeding an entire colony early in the spring, and before the queen gets crowded put them in a 10-frame hive. Go on feeding, and then transfer them to two 8-frame hives set close together, with the adjacent sides perforated every few inches, and with a bee-way top and bot-

tom. Go on feeding gently until a week before the honey-flow, and then put on two supers, side by side.

2. Will bees which have been carried by syrup to be fed, so long as the queen is not crowded?

3. Do you think there would be any advantage, so far as yield of honey is concerned, in dividing an apiary of 140 colonies into 28 smaller colonies? Is it possible that the bees are 1 mile distant from the home-apiary, assuming, of course, conditions equal all around as to bloom? MINN.

ANSWERS.—1. The probability is that the queen would not go readily from one hive to the other, when you had the two hives side by side with holes for passageways, and if she should for some reason, there would be some likeness of the bees starting queen-cells in the one she left had.

Instead of changing from the 8-frame hive to a 10-frame, and then to two 8-frame hives, better to start at once with the two 8-frame hives, putting one hive over the other. As soon as you think the bees are in danger of being crowded with only eight frames, put the second story under the first. Even if this is done before the bees are at all crowded, it will do no harm. The heat of the hive rises, and an empty hive below would not cool off the brood-nest as it would with the empty hive above or at the side. Then when the bees became crowded above they could work down into the lower story; or, if you thought they were too lazy about it you could put a frame of brood from the upper story in the lower story. But when it comes time to put on supers, I have always found it better to take away one story, crowding the brood then.

2. Yes, the bees will store in the brood-combs anything fed to them, so long as there is plenty of room there. But it is not wise to crowd the brood-nest at any time, for there is a possibility that the combs may fill up so rapidly with brood that the bees will feel obliged to empty some of the cells in the brood-combs of their stores, carrying the same up into the super, altho when the stores were given there may have been abundance of room in the brood-combs.

3. Most surely, in any ordinary location. The only exception would be in some location so remarkably rich in resources that 140 colonies could get all they could gather without going farther than ½ of a mile from home.

Using Extracted Honey-Dew Profitably.

How can extracted honey-dew be used in the apiary to good profit and advantage? What other uses can there be made of it?

KANSAS CITY.

ANSWER.—It can be fed to good advantage in the spring to be worked up into brood. It may also be sold for manufacturing purposes.

Getting Extra Extracting-Combs.

Being short of extracting-combs, I am thinking of filling the supers next spring with comb, and the frames with starters, half and half, alternately. How would it do?

I extracted my fall aster honey in November, and got about 40 pounds to the colony, which makes about 70 pounds for the year—about an average with us here. I winter my bees outdoors, of course, and up to this time they have had a good flight every day, if not raining.

SOUTH CAROLINA.

ANSWER.—If I understand you rightly, there will be a fully-drawn comb, then a frame with a starter perhaps an inch deep, then a drawn comb, then a starter, and so on. An objection to this, especially if the harvest is at first a little heavy, is that these combs which are the fully-drawn, will and will make the newly built combs very thin. It may be better to have all the drawn combs together on one side, and all the starters together on the other side. Then the new combs will be more uniform in thickness. If the extracting-combs are of the same size as the brood-combs, you might like the plan of having the new combs built in the brood-nest instead of in the super. In that case you can alter the frames, for when used for brood there will not be the same danger of having the combs unequal in thickness. Moreover, if you prefer worker-combs, you will have less drone-comb built in the brood-nest than in the super.

The Premiums offered this week are well worth working for. Look at them.
Bees Did Fairly Well.

My bees did fairly well the past season, averaging 50 pounds per colony, but it was very dry all summer, and one of my neighbors did not get any honey at all. There are very few beekeepers around here, and our bees have a large range. They are wintering finely so far; Dec. 23d and 24th they had a good flight, and look healthy and strong in numerous colonies.

I am going to try the fences and plain sections next season as I believe they are an improvement.

J. Wm. H. SHERMAN.
Suffolk Co., N. Y., Dec. 29.

Report For The Season of 1900.

We have had another poor honey season in Texas, altho there was considerably more honey produced than in 1899. We commenced the season with 500 colonies, had but a little increase, and harvested 21,600 pounds of honey, divided as follows: Extracted 11,500 pounds; bulk comb, 7,540 pounds; section honey, 1,464 pounds. We have had abundant fall rains, and vegetation is up; we therefore expect a good crop for 1901.

A few days ago we sent our renewal to the American Bee Journal, which we can not do without.

O. P. HYDE & SON.

Bumble-Bees in Winter.

On page 809 (1900) a beginner asks, “Where do bumble-bees winter?” I am pleased with the question, and would like to have some naturalist tell us all about it.

In Canada we have several kinds of bumble-bees, some very small and others all the way to very large. They

AMERICAN BEE JOURNAL

Jan. 17, 1901.

DR. PEIRO

34 Central Music Hall, Chicago.

The wrapping-label theory of this paper indicates that the end of the month is when your subscription is paid. For instance, “Dec. 6th” on your label shows that it is paid to the end of December, 1900.

Subscription Receipt—We do not send a receipt for money sent in to a subscription, but change the date on your wrapper-label, which shows that the money has been received and duly credited.

Advertising Rates will be given upon application.

Retained Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Entomological and the Philological Society of England: Change “th” or “st” to “fth” when pronounced, except when the “th” affects a preceding sound. Some other changes are used.

Maule’s Seed Catalogue

YOU should, by all means, have this most modern catalogue of modern times. It is peculiar and interesting, having good lines in vegetable, farm and flower seeds, flowering plants, fruits, bulbs, etc. It contains 45 novelties in vegetables and flowers and new and choice selections, large pages, seven handsomely colored plates and hundreds of illustrations. It gives the latest, up-to-date, cultural directions and offers many cash prizes. The first edition alone cost us $1,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which amount they may deduct from their first order. You will make a mistake if you do not write to-day for this the Novelty Seed Book of the year. Address, WM. HENRY MAULE, Philadelphia.

Hammond's Mammoth Tomato.

Michigan tomato seed is best on earth. Hammond’s Mammoth makes a splendid last year weighing 5 lbs. Largest tomato that grows. Hammond’s Earliest Tomatoes have been copyrighted by others in southern, Hammond’s earliest Tomatoes and Hammond’s Golden Heir and Hammond’s Profuse Bush are named of some small merit. Handsomely illustrated catalog of Tomatoes, fine in prices for 1901, and all leading cities. Hammond’s Earliest Tomatoes and Vegetable seeds mailed FREE on request.

Vegetable Gardening FREE

“Vegetable Gardening” is free to all who buy seeds advertised in this number of the American Bee Journal.

NEW UNIV. N. D. SEEDS

All new, only combination 1 and 2 are patented and dallmade. Every way adjustable. All our seeds have tough oak lasting and are packed in moisture, popularized seed for catalog, delecting ‘s mode and can be obtained.-

AMERICAN FLOWE CO. 24 Market St., Boston.

Please mention Bee Journal when writing.
are variously and beautifully marked with pleasing colors. The smallest of all are the rarest, but their nests are the richest in honey. The medium sizes winter generally in the woods under old logs, where there is a large accumulation of old leaves. The smallest and largest may winter in the same fashion, but I don’t know about that. I have often wondered if it could be that they migrate to the South like the birds, and speculate a season there and return North the following spring. Only the queens live thru the winter. I have handled a good deal of wood, logs, and timber in my day, but never found any of the smallest or the largest kinds in winter. Who will tell us all about it, in the columns of the “Old Reliable,” just by way of direction and information?

Ontario, Canada.

S. T. PRETTIF.

Beads Didn’t Do Well.

I have 20 colonies of bees, but they didn’t do well last season. They will need next season will be a better one for bee-keepers.

I appreciate the Bee Journal very much, and can’t very well get along without it.

H. C. ROBERTS.

Lawrence Co., Ohio, Jan. 8.

Bee Wintering Nicely.

Bees are wintering nicely in the cellar, but no snow on the ground is hard on the clover.

N. STAINEGER.

Cedar Co., Iowa, Dec. 12, 1900.

No Honey Last Season.

I have 29 colonies of bees in good condition on the summer stands, but I got no honey the past season. There

...
were plenty of blossoms, and I never saw bees do better on fruit-bloom. I can not do without the American Bee Journal as long as I keep bees, which will probably not be many years more, as I am 71 years old.

S. H. ARPS.

Prospect Fair For Next Season.
The honey crop last season was an entire failure in this part of Ohio. Bees are enjoying a flight today. Mine are to be all right, the lake to feed for winter.

White clover is plentiful and the prospect is fair for the coming season.

G. C. ALLINGER.
Marion Co., Ohio, Jan. 10.

How to Sell Canned Honey.
Years ago I came to the conclusion that the proper way to dispose of extracted honey was to sell it in tin packages in the canned form, and I began putting up honey both by the winter trade in raised-cover tin pails, and for my trouble I met lots of opposition, but I determined that the battle must be fought along that line. I first had to overcome the prejudice to canned honey by guaranteeing my honey to be strictly pure, and that it would candy in 24 hours. The chief trouble was that the packages were too dear for my customers, and I began using 3-pound tin fruit-cans and sealing the lids with wax (grafting wax is best). I get 23 cents per can, or $2.75 per dozen; this is for fall honey, mostly touch-me-not. I buy the cans by the gross, and stick on them a neat label. For the summer trade I use the one-pound glass jars to a small extent. I get $1.32 per dozen for pound jars. My crop of honey was 1,675 pounds of extracted honey from 63 colonies.

C. A. BUNCH.

Wintering First-Rate.
There was not a blossom of white clover or linden the past season, and my bees did badly. They are wintering first-rate.

The thermometer is 8 degrees above zero this morning, and weather clear. We have had but little snow, and fine weather.

H. MESSER.

Not Much Surplus Honey—Foul Brood.
The bees did not store much surplus last season. They store in the spring during maple, elm, box-elder and locust bloom, and also during fruit-bloom of all kinds. I expected to get a large amount of honey, but you know how often we are disappointed in our expectations, and I did not get over 25 pounds of surplus honey, all told. Swarming commenced the latter part of April and continued until June 20. My bees never were, in better condition for work, being very strong. I sold 40 colonies the latter part of May to a bee-keeper in the county, and he secured considerable honey.

I have about 80 colonies left, which are in good condition for winter. I winter my bees on the summer stands, and they are always packed, summer and winter—"what will keep out the cold will keep out the heat," you know. The covers are sealed down tight, and soft-maple leaves are packed on the top of the queen frame, and it will keep warm. I have had very little winter loss for a number of years, or since I got rid of foul brood.

I lost hundreds of colonies from foul brood. I bought some bees that had it, and once it got into the apiary I had a time of it. I did not then know what it was, but tried everything to get rid of it, and burned a great many colonies, hives and all. That was about 8 or 9 years ago, and I do not remember when I got rid of it.

Some of the old hives that were in use during this season, and the old hives with their covers put on after the bees were dead, and were left in the apiary. I cleaned out some of them two or three years ago, and put them away; but they got booted up in a box, and I boiled some of the frames so as to be on the safe side, and tried a few without boiling, and there was no difference—no signs of foul brood in either case—so I scraped all the old hives and frames and they are now in use. I sent specimens of the foul brood to A. I. Root and Dr. Howard. I detected the odor of foul brood, but work with it until I got rid of it.

D. C. McLEOD.
Christian Co., Ill., Dec. 29.

Bees Did Poorly.
Bees did poorly in this neighborhood last season, but mine gathered enough for winter and stored an average surplus of 12 pounds per colony, amber extracted, from fall flowers. May the American Bee Journal long prosper, and if beekeepers can't afford to send in the dollar we might as well give up trying to keep bees.

S. O. LARKSON.

Report for the Season of 1900.
We run about 250 colonies for comb and extracted honey the past season, and averaged 50 pounds to the colony. We hope to do better in 1901. We winter our bees and the summer stands with sawdust on top of the frames.

W. J. STEWART.

Aster as a Honey-Plant—Introducing Queens.
The honey-crop in 1900 was about as much of a failure as 1899, if not worse, but we should be thankful for what little we did get, and hope for better things the coming season. I plan with two colonies, spring count, increase to five, and secured 168 pounds of honey.

I also had charge of an apiary which we began with two colonies, spring count, increase to 24, and secured 1,200 pounds of extracted honey, mostly from aster.

Mr. W. W. McNeal certainly gives

G. W. YORK & CO.
118 Michigan Street, CHICAGO, ILL.
the aster a much-deserved good name on page 793. I would advise "Mississippi," page 783, to try this, as he advises growing for good ornamental plants. It has proven a boon to beekeepers here. It comes into bloom the very last of September, and gives us a fair size crop. I received an order of young bees for winter, and bountiful winter stores. It granulates very quickly, however, especially when extraneous or unripe honey is solid in 10 days, and when mixed with no other kind of honey it has much the appearance of land.

Last June I received a tested queen from a noted queen-bred in the East. She arrived all right, and I put her away until the morning, as I was very busy at the time. The next morning I destroyed the reigning queen, and as I had so much work on hand I did not take time to separate the new one from her escort, but pulled both the wire-cloth, exposing about an inch of candy, and set the cage on the top-bars of the hive. Some honey was coming in at the time, but I was also feeding them. I examined the hive 48 hours after the queen was released, but in a day or two when I looked again there were numerous bunches of queen-cells, but no queen to be seen. L. WILLEY MOUNTJOY.

Anderson Co., Ky., Dec. 22.

Bee in Good Condition—Swarming. Bees went into winter quarters in this locality strong in numbers, and plentiful supplies of food. The hives were left on the summer stands until late in November, owing to the mild weather. They stored an average of about 50 pounds of surplus honey, and some colonies stored as high as 100 pounds—I think mine did, spring count.

In my apiary, some years ago, a large swarm issued in June; without making any attempt to clutter they put for the woods, which is but a stone's throw from my apiary. They went slowly, flew to the tops of the trees past I was quite certain they had a tree look up in which they were intending to settle, and, sure enough, after going about 80 rods they settled and a half of them from a pine, which was about 3/5 feet in diameter. The next morning I cut down the tree and safely hived the bees. Does this look as if the tree is a choice one to fly directly from the hive to the tree? The "Old Reliable" continues its weekly visits, and is a most welcome guest, as he brings many good things. Long may it and its editor live to bless the fraternity which they represent.

Honey and Beeswax

MARKET QUOTATIONS.

CHICAGO, Dec. 21.—The demand has fallen off very much of late, but prices have not declined to any great degree from those prevailing for the past 60 days, but any probable to sell would cause a decline. Fancy white comb, No. 1, 5.25; No. 2, 4.50; No. 3, 3.75; No. 4, 2.25; 10 cents per pound, dark and buckwheat, 70 cents. Extracted, white, 71 cents; amber, 75 cents; buckwheat and other dark grades, 68 cents. H. E. BROYCE.

R. A. Burnett & Co.

KANSAS CITY, Dec. 21.—Honey market firm, demand steady. Fancy white comb, 2-section case, $3.50 to $3.75; 12-section case, $7.50 to $8.25; marble case, $12 to $13.50; comb, $3.75 to $4.25; 10 cents per pound, 35 cents. Extracted, white, 80 cents; amber, 75 cents; buckwheat and other dark grades, 68 cents. R. A. Burnett & Co.

BUFFALO, Jan. 4.—Honey market is very quiet, and demand at 73 cents for white, 75 cents for amber, and higher prices are not obtainable. Fancy white comb sells for 70 cents; lower grades do not want to sell. Extracted, white, 70 cents; amber, 75 cents; 10 cents per pound, 75 cents and higher; fancy white clover brings 80 cents. L. S. S. BATTISON & Co.

ALBANY, N.Y., Jan. 5.—Fancy white, 175 cents; marble case, 240 cents; 12-section case, 320 cents; 10 cents per pound, 35 cents. Extracted, white, 88 cents; and amber, 78 cents. C. W. WEBER.

BOSTON, Dec. 22.—Fancy No. 1 white in cartons, 15c.; A No. 1, loco. No. 1, 105 cents, with a single case for 75 cents; B No. 1, 100 cents, with a double case for 75 cents, and for 65 cents; C No. 1, 90 cents, with a single case for 70 cents, and for 55 cents. No. 2 white, 54 cents. Extracted, white, 76 cents; amber, 80 cents; 10 cents per pound, 80 cents. L. S. S. BLAKE, SCOTT & Lee.

CINCINNATI, Jan. 4.—The market for comb honey in this locality is strong, but alibo higher prices are not obtainable. Fancy white comb sells for 50 cents; lower grades do not want to sell. Extracted, white, 70 cents; amber, 75 cents; 10 cents per pound, 75 cents and higher; fancy white clover brings 80 cents. L. S. S. BATTISON & Co.

NEW YORK, Dec. 22.—Fancy white, 185 cents; No. 1 white, 14c.; No. 2 white, 12c.; No. 3 white, 10c.; buckwheat, 105 cents. Extracted, in fairly good demand, at 50 cents, 40 cents, and higher; for amber, off grades and Southern in barrels at 15 cents. Not much demand for extracted buckwheat at present. Some little selling at 50 cents. Beeswax firm at 25 cents. C. W. WEBER.

New York, Dec. 22. —Fancy white, 180 cents; No. 1 white, 14c.; No. 2 white, 12c.; No. 3 white, 10c.; buckwheat, 100 cents. Extracted, in fairly good demand, at 50 cents, 40 cents, and higher; for amber, off grades and Southern in barrels at 15 cents. Not much demand for extracted buckwheat at present. Some little selling at 50 cents. Beeswax firm at 25 cents. C. W. WEBER.

Detro1T, Dec. 22.—Fancy white comb, 150 cents; No. 1 white, 12c.; No. 2 white, 10c.; No. 3 white, 8c.; buckwheat, 105 cents. Extracted, white, 75 cents; amber, 70 cents; and dark, 60 cents. HONEY and BEESWAX.

M. H. HUNT & SON.

SAN FRANCISCO, Dec. 19.—White comb 14 cents; amber, 115 cents; dark, 80 cents. Extracted, white, 75 cents; light amber, 60 cents; dark amber, 55 cents. Beeswax, 200 cents. C. H. WEBER.

SAN FRANCISCO, Dec. 19.—White comb 13 cents; amber, 115 cents; dark, 80 cents. Extracted, white, 75 cents; light amber, 60 cents; dark amber, 55 cents. Beeswax, 200 cents. C. H. WEBER.

Honey market slow with light stock, sell ing at concessions, especially on extracted, which have been holding too high for some time. H. W. RYHER.

BOSTON, Jan. 4.—The market for comb honey is strong in this locality, and alibo higher prices are not obtainable. Fancy white comb sells for 50 cents; lower grades do not want to sell. Extracted, white, 70 cents; amber, 75 cents; 10 cents per pound, 75 cents and higher; fancy white clover brings 80 cents. L. S. S. BATTISON & Co.

The Bee-Keeper's Guide

Or, Manual of the Apiary, by PROF. A. J. COOK.

460 Pages—16th 1890 Edition—18th Thousand—$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in meat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year.

Send us two NEW subscribers to the Bee Journal (with $2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for $1.25, or we club it with the Bee Journal for a year—both for only $1.25. But surely anybody can get only TWO NEW subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it. Will YOU have one?

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.

YELL0W OR WHITE

Sweet Clover Seed

Free as a Premium

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us $1 with a new name for this year, we will mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey closers. Better send two new subscribers (with $2.00) and get the three pounds of seed. Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.

Price of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents— to pay for package and postage. By freight—one 60-pound can, 95 cents per pound; two cans, 9 cents per pound; four or more cans, 85 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box. This is all.

ABSOLOUTELY PURE BEES' HONEY.

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

C. C. MILLER.

McHenry Co., Ill.

Order the Above Honey and then Sell it.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.
Bee-Keeping at the Pan-American.

The busy bee will be in big business at the Pan-American Exposition the coming summer. It has been decided to construct a special building for the proper display of the working colonies of bees and the great variety of bee-keepers' supplies which will constitute this exhibit. It is expected that this will be the most extensive bee-exhibit ever prepared in this or any other part of the world.

The exhibits will be so arranged that the bee-may enter their hives from the exterior of the building, and carry on, their work undisturbed by visitors, yet in full view thru the glass sides of the hives. As the successful management of an apiary requires a knowledge of botany as well as the habits and requirements of the bees themselves, this exhibit will illustrate the operation of an apiary, and will show the common honey-producing hive in a way to be understood by all who may be interested. The relation of bees to horticulture and agriculture will be clearly shown, and the many uses of honey illustrated.

Since the invention of the movable-frame hive by Langstroth in 1851, the application of labor-saving, honey-saving, and bee-saving devices has been very interesting and important, as is well known by up-to-date bee-keepers everywhere. It is intended to make the most complete display ever seen of things aparian at the Pan-American Exposition.

Amateur Bee-Keepers is the heading of an article by Rambler. In Gleanings in Bee-Culture. He contends that to the amateurs the bee-keeping world owes quite a debt. He begins with Samson, who founded a colony of bees in the canvas of a lion, "some writers going so far as to claim that Samson invented the movable-frame hive, from the supposition that the bees built the combs to the ribs of the defunct lion; and it was the comb attached to one of these ribs with which he sweetened himself."

Rambler then mentions Virgil, of later time, followed by Huber, and notes in passing that contemporaneous with him were many German investigators who were amateur bee-keepers.

Then coming across the ocean he finds Langstroth, who was not an extensive bee-keeper, yet it was he who by the invention of the movable frame opened to view the mysteries of the hive, and made it possible for bee-keeping to become a remunerative business.

After that, again jumping back over the ocean, it was Hruschka who discovered the idea of the honey-extractor.

Returning to this country, among the many amateur bee-keepers who have been of great service to the bee-keeping world, he names A. I. Root, Prof. A. J. Cook, Samuel Wagner (founder of the American Bee Journal), Thomas G. Newman, F. Danzebaker, and Arthur C. Miller, the inventor of the hot-plate foundation-fastener.

Skipping across the ocean once more, Rambler turns to the Mahring, A. W., who invented comb foundation, also Prof. Che-shire, and Thos. Wm. Cowan, editor of the British Bee Journal, and inventor of the Cowan honey-extractor.

As Rambler intimates, the foregoing are only a few of those who while only amateurs in the pursuit of bee-keeping, yet did much to bring it up to its present high place among the useful businesses of the world. Surely, no amateur bee-keeper need be ashamed of his place or efforts, either in the past or present. May his tribe increase, and continue to bless the craft with bright and helpful ideas.

Pure Stock vs. Crosses.—A Stray Straw in Gleanings in Bee-Culture is as follows:

A 8x8 strain of bees is very desirable for the sake of combining good qualities without change. But the "8x8 strain" idea may be worked too hard when it comes to the matter of improvement. With a strain so 8x8 that there is no possibility of variation, there is no possibility of improvement. Continuation of good traits comes from fixation. Improvement of traits comes not from fixation, but from variation. The trouble with a cross is that its characteristics are not 8x8, but that does not argue against the possibility of greater improvement in the cross, and then it is the province of careful breeding to make that improvement 8x8. I am an advocate of pure stock; but if I had the purest and best Italians on earth, and a cross that would beat them in storing by 50 percent, I'd drop the purity and try to fix that 50 percent. I'm sure you will find that crosses would have a very strong tendency to sport back to the original stock, either one of which would be better than the mixture."

There is a somewhat sharp conflict between the Straw and Editor Root's comments; but not an irreconcilable one. Both views are correct. The progeny of pure or thorouged stock is likely to continue the qualities of the parents. The progeny of a cross is likely to back to the qualities of one or the other of the parents, selecting perhaps some of the best desirable traits, but there is a possibility also, that there may be a sporting toward good as well as bad qualities. In the hands of the ignorant and careless, a cross is likely to run much more rapidly to the bad than pure-bred stock. In the hands of the careful there may be more poor than good in the progeny of the cross, but by careful and severe selection there is a possibility of something that may be an improvement on the pure stock on either side from which the cross originated. It is a question for each one to decide for himself whether he will try the more hazardous plan of breeding for improvement from an unstable cross, or the safer plan of breeding from pure stock.

"Bees Do Nothing Invariably" is a saying attributed to Mrs. Tupper, and there is much truth in it. To establish any general rule about bees, there must be no little observation. Because you see bees do a certain thing on a certain day, you are not safe in saying that all bees invariably do the same thing every day. What is true at one time may not be true at another time. What is true one season may not be true the next. What is true in one place may not be true in another place. Laugh as much as you will at the frequent recurrence of the phrase, "in this locality," in many cases locality has a large influence.

As illustrating this matter, one man, having made careful observations, says he has found that when a bee brings in a load of pollen it brings no nectar, and vice versa. Another man, observing just as carefully, finds a full honey-sac in bees carrying pollen. In order to establish a general rule on the subject, there must be repeated observations, all the better if made by different observers in different places and at different times.

C. Davenport says on page 775 (1900), that he has found hundreds of bees carrying both pollen and honey, while an Ohio professor found bees carrying only one at a time. Which was the more exceptional case? The general opinion has probably been in accord with Mr. Davenport's view, but it is doubtful whether many have closely observed. If it is safe to venture an opinion, it is that careful observation will show that the popular opinion is in general the correct one, and the coming season may find many to substantiate Mr. Davenport's testimony.

Another illustration may be found by referring to pages 530 and 777 (1900). The observations of "Rip Van Wrinkle" do not entirely agree with those of Prof. Cook, as to the matter of scouts, and as to the reason for clustering. The questions are interesting, and may possibly be of practical importance. There is no lack of testimony that scouts are sent out by some colonies before the art of swarming. In apiaries where swarming is anticipated by dividing or other means when the condition of the colony shows that swarm-

SOMETIMES.

"The hand that rocks the cradle is the hand that rules the heart."—Marlowe.

But the hand that rocks the cradle, sure Is the hand that spans the baby.

Mr. T. F. Bingham, of Clare Co., Mich., wrote us Jan. 4th:

"The weather is fine, and the wintering prospect outdoors is better."

Mr. N. D. West, of Schoharie Co., N. Y., wrote us Jan. 3d:

"It is zero weather this morning; no snow, good wheeling, and bees are quiet."

The Australian Bee-keeper is guilty of the following:

 Jogging him: "Ello, Stumpy! What's de matter wid you? You don't got de hives." "No, I got de bees!"

Editor Hutchinson, of the Bee-keepers' Review, says:

"A pun, if a good one, is often quite enjoyable. For instance, at the banquet held at Niagara Falls during the Ontario convention, there was a sallie given to the green color of the water in the rapids just below the falls, and some curiously express us to what this color was due, when some one suggested that it was green because it had just come over."

Mr. W. A. Seiber, of Philadelphia, we learn in a letter from him dated Jan. 13th, lost his beloved sister, by death, last month. We had the pleasure of making her acquaintance when stopping at Mr. Seiber's home a year ago last fall, while attending the National Convention. Among other things in his letter, Mr. Seiber says:

"She was so helpful to me in my business; from the very first the hives seemed to take a liking to her. Ten years ago, when I first began the idea of bottling, there was no end of mishaps and drawbacks to my experience on my part, and loss of hundreds of dollars in little accidents from the lack of knowledge as to how to do anything. She became discouraged, and feel like giving it up, when she would cheer my heart with encouraging words, and then go away, and try to show me where I was wrong. We would work side by side with my wife and man, weekly, to make it go. For the first few years she did all the labelling, then as my business increased, and I had to employ a larger force, she took charge of the molding of some four tons of beeswax in 1 ounce, 4 ounce, 5 ounce, and 1-pound cakes, packing them in beautiful, attractive boxes and getting them in shape to ship to my trade in Baltimore, New York, and Boston. She also put up many series of sections for my made-up hive-sales in spring and summer. And in all the years she would never once fail for her services; and upon the anniversary of her birth, when I would desire to remember her in a substantial way, she would say, 'Do not, my dear, you are doing too much for me!' Her life was one of usefulness, and the very idea of pay would take her real pleasure out of her service."

The pecuniary loss is the smallest part to me, but her bright, sunny, Christian disposition, so encouraging at every turn, will be one that I shall treasure in a heart that never can be filled. We laid her body away on Dec. 23rd; her Christmas was with Christ, the Lord. She had been in the office to bring her home on account of appendicitis; she was sick only six days."

In addition to our own sympathy. Mr. Seiber will have that of all the bee-keeping friends in the departure of his sister. But his loss must be great on the other side, where only character is valued. And then there is no little gain in those who are left behind, for the influence of her devoted life and example will ever remain to bless those who knew her, and to be her memories as pleasant as the sweet fragrance of beautiful flowers."

HONEYED BAKED APPLES.—Mr. A. E. Willett sends us the following which he elipt from some paper:

"In baking apples, honey for sweetening is truly delicious. Wash the apples and core them, but do not peel; a bit of cinnamon may be put in the holes made by removal of the cores. Put the apples in a baking-pan with just enough honey to cover the bottom of the pan. When the apples are baked for 20 minutes, add the honey and baste them frequently until the apples are half full of honey to every six apples. Eaten hot or cold, with or without cream, they are delicious."

We publish this same information several years ago, and we were quite certain it originated with the bee-keeper who then sent it to us.

Mr. W. L. Coogshall, of Tompkins Co., N. Y., writes us that it does not look very bright for his bee-keeping in Cuba, as signs of diseased brood are appearing. On page 29 (1900) it was mentioned that Mr. Coogshall had shipped a lot of bees to Cuba, expecting to carry on the business there.

Mr. J. E. Crane, of Vermont, has an article in the Bee-Keepers' Review telling how his bees helped to build his beautiful home, a picture of which forms the frontispiece. He says that when young he was quite an invalid, and the doctors advised living on a farm, but he was not able to do heavy work, nor had he the capital to employ someone to do it for him. No one in his locality had made a business of bee-keeping in those days—about 40 years ago—the some of his neighbors kept bees, and were able to sell some honey in good seasons. He read the books of Quinby and Langstroth—there were no periodicals devoted to bee-keeping in those days, but he believed in saving every penny he could to employ the needed help to work on his farm, even if he did not produce enough to make a living at the bee-business. He began in a small way, as all beginners should do, and did not get a pound of surplus the first season, as it was a very poor one. The next year his colonies averaged 100 pounds. He then increased his apiary until he had six or seven hundred colonies all his own. He used frame hives from the very first, and had Italian bees. The price of honey averaged 30 cents per pound about the cost of selling, being fully double what it is today.

He thinks that more failures in bee-keeping come from increasing too rapidly than from any other cause. He believes the beekeeper should turn all kinds of seasons, and believes that they will pay as well, ordinarily, as any other branch of rural industry. After 35 years of work with them he is more interested than ever. He thinks that it pays to persist in the business rather than to sell out when a poor year comes or bad luck befalls. He realizes that many parts of our country are not for keeping bees profitably, the same as would apply to wheat-growing or fruit-raising, and that there is nothing to be gained by trying to believe that bees can be made a success everywhere. The way to discover a good location is to investigate the flora, and come to the conclusion that you have kept bees some years in such localities.

The Ontario Bee-keepers' Association elected the following as its officers for 1901, at its meeting held at Niagara Falls last month:

President, John Newton, of Thamesford; 1st Vice-President, J. E. Provost; 2nd VicePresident, Jas. Armstrong; Secretary, Wm. Couse, of Streetsville; Treasurer, Martin Ennig, Foul-Brood Inspector, Wm. McEvoy, of Woodfords; Assistant Inspector, F. A. Gemmill of Stratford.

Woodstock, Ont., was selected as the next place of meeting. We learn that the last meeting was the best ever held by the Association. We hope soon to find room for an epitome of at least a portion of the proceeded.

Mr. G. M. Doolittle has been down in Arkansas for several weeks, looking after a farm in which he is interested. He expects to be at his home in New York State again about Feb. 1st. Among other things he says this in a letter to us dated Jan. 12th:

"I do not see why bees ever need to die in wintering bees here (Srabton Co., Ark.), if they have food enough, for more than half the days since I have been here have been warm enough for them to fly, and the sun has shone every day but two."

By Dr. A. B. Mason, Sec.

(Continued from page 39.)

Pres. Root—We will next listen to the paper by George W. York, on

HOW TO SHIP HONEY TO MARKET, AND IN WHAT KIND OF PACKAGES.

While this subject is ever one of greatest interest to those bee-keepers who make the production of honey a real business, still it is also a topic on which it is almost impossible to say anything new—especially for me to do so.

Unquestionably, the “how” to ship honey to a distant market is by freight, every time, and for two very important reasons, viz.: First, the transportation charges are much less than by express; and, second, the comb honey so shipped is more likely to arrive at its destination in good condition.

SHIPPING COMB HONEY.

In the shipping of comb honey great care must be used in its preparation to withstand the necessary handling in transit. Judging from personal experience, and also from what extensive observation in the Chicago market, the only safe way in which to put up comb honey to stand shipping successfully is first to put it into non-drip cases, having a follower-board at the back of the sections, with newspaper or cardboard laid on the back of the follower. After that, the cases of honey should be placed firmly in a large crate whose upper side-pieces extend out and beyond each end of the crate about six inches, to be used as handles for carrying between two men. In the bottom of the crate should be put a bed of straw or hay, to act as a cushion under the honey-cases. Then, when putting the cases in they should be so placed that the glass side of each shows thru the crate. This will be an aid to the freight handlers, revealing the contents, and thus suggesting care in moving the crate.

It is not a bad thing to put hay or straw on top of the cases before nailing the top slats on the crate, so that should it accidentally be turned upside down, the honey would not be injured.

But in addition to all the above care in packing comb honey for shipping, it is also well to mark or tack on this precautionary notice, in large letters, COMB HONEY—HANDLE WITH CARE.

If comb honey is prepared for shipment as above directed, precious little of it will suffer any when shipped, no matter what the distance, nor how often it may be transferred from one railroad to another.

CAR-LOAD SHIPMENTS OF COMB HONEY.

For car-load shipments of comb honey no crates are necessary. Simply see to it that the cases are placed solidly in the car in such a way that the combs are parallel with the railroad track. This is necessary in order to avoid breaking down of combs from the sudden starting or stopping of the cars. The bumping of freight-cars is simply an awful thing, hence every case of honey must be securely fastened. It is a good plan to put a light bed of straw or hay on the floor of the car before putting in the cases of honey. Even if not really necessary as a cushion, it would serve to keep the bottoms of the first row of cases clean.

If you wish to keep the tops of the top tier of cases neat and clean in the car, I have a device which will keep them, the cases, and the railroad car ‘clean’ at all times. It is simply a large canvas covering which can be used, and after the honey is unloaded, this canvas can be returned by freight to the shipper, and thus used over and over again. It pays to keep comb-honey cases absolutely clean. We all know how dirty and dusty one becomes when traveling even in the comfortable upholsteret passenger coaches; but how much worse it must be in a rough old freight-car!
pump. I poured and poured; thinks I, that holds an awful sight of water. I thought I would examine it, and I went around the barrel and there it was coming out in a big flat stream. I then lifted the neck and out it shot. It was a sample, not regular stock. If that was the case with samples, what would his regular goods be? Only last year I bought five-gallon cans and on taking some of those to market, the man wanted to down them as fast as I could have rolled them right out. I would like to ask Mr. Hatch, Who buys our honey? Where does it go? Where does the honey of the world go—to the table? I don't find it so. I find our manufacturers, too. They put the honey in the market and I don't find them. I would give you a cent a can for honey; barrels are cheaper, and, as Mr. France says, if you keep water out of barrels you won't have any leakage.

D. H. Cogshall—in our vicinity, the last ten years, we had a kegs, and I don't want any second-hand kegs. They hold 210 pounds. Now, we get them hoop with flat wooden hoops, 12 on a keg. We got our kegs last February for this year; they are scattered around. The process, in our manufacturing purposes, wouldn't give us any more for it in cans than they would in the kegs, which are made of white poplar, as I understand it. They are thoroly put up every reed very covertly.

Mr. Moore—My experience in this respect has not been very satisfactory. I notice there isn't any certainty that there would be no loss either in barrels or cans. I know that [the] few years ago it seemed to be barrels, and now it is coming more and more in cans. My own personal experience has been more favorable with cans. The first year of foam brood with us dates back to leaky cans. The cans came to the farmer, and before they could get them off, the honey leaket down on the car and about two weeks after that foul brood started in our apiary. That would not be an argument against cans.

Mr. Chandler—We had considerable experience with tin cans. I would advise those going to use tin cans not to use second-hand ones. [Applause.] If you use second-hand cans, and lose one can of honey, you have lost enough to pay for the difference between quite a number of second hand cans, and how much a few barrels of honey lost in one can and lost more in one year than would have paid for the difference between second-hand cans and new cans for five years; I put up 400 or 500 cans a year.

J. A. Green—I want to count myself among the barrel men. One after another has made most of the points I expected to speak on. I will say that my experience has been, with Mr. France and others, that the barrel is almost absolutely certain, while I lost considerable honey in filling new cans, and from honey that was shipped to us in tin cans. There is one barrel that hasn't been spoken of, the hardwood barrel that Mr. Dadant has used for years: it is a second-hand alcohol barrel. You can get them at all drug stores. They make them 500 to 600 gallons. I have about 350 pounds and the other about 550. Of course, it depends upon your market; my market demands, or at least will take just as readily, those large barrels. When I get an order for a barrel I send one of those 550 pound barrels that will hold 400 pounds, and the other about 550. If they have kept a long time in a perfectly dry place, put them in the sun and then tighten the hoops. Somebody said you could not use barrels in Colorado, the climate is too dry. That is not so; I have them in Colorado where it will get perfectly dry, then drive down the hoops and hasten them, and you have something that will hold.

Mr. Dunne—Old alcohol barrels are coated with glue, and it is not off glue, and what else would it be? Mr. Chandler—I think it is shilac. Mr. Dunne—No, it is glue.

Mr. Chandler—I used to wax the barrels inside, or use paraffin, but late years I have not done it.

Mr. Moore—My brother has used alcohol barrels for a

Rearing Queens in Early Spring—Some Advice.

BY G. M. Doolittle.

A CORRESPONDENT writes as follows: "Will you please tell us thru the columns of the American Bee Journal how early in the spring we can commence to rear queens, taking the stage of advancement in drone-rearing as a guide? I wish you would give me a period from which to work; I rear queens when we see larvae in drone-cells, will drones from that larve be on hand to meet the queens when they are ready? If so, in this way we can tell just when it will do to commence queen-rearing, no matter whether we are located in Canada or Florida."

If the correspondent, or any one else, uses any of the plans by which larvae from 24 to 36 hours old are given to the bees from which to rear queens, said queens will perfectly matured, when their cells in from 11 to 12 days from the time they are started, as a rule, for, by an experience covering a period of 30 years I find the average time, taking the seasons as they come, and the season from early spring to late fall, for a queen, is three days in the egg form, nearly six days in the larval form, and seven days in the chrysalis, making a period of nearly 16 days from the time the egg is laid to the time the young queen emerges from her cell. Very warm weather retards the development during all stages, to a slight extent: while very cool weather, or inactivity with the bees, as in the fall of the year, retards this development. I have never known this development to be hastened to a greater degree than having the queens emerge from their cells 15 days; but I have had it so retarded in the fall of the year, especially where queens were reared in upper stories, that they did not emerge from their cells, or become fully matured, till 20 days from the time the egg was laid by the mother queen. But, as I said before, about 16 days is the rule, and it is one which can be depended upon in nine cases out of ten.

Then, as a rule, the young queen does not go out to meet the drone till she is from six to eight days old, and one or two days being about the average during the summer months, so we have the time as being not far from 17 to 20 days from the starting to rear queens to the time they would naturally fly out to meet the drones, where everything is favorable. Occasionally a queen will fly from the hive, especially if it is a queen that is not as yet fully developed, when 5 to 7 days old; and I have known them to be 25 days old before becoming fertile, but in nine cases out of ten queens are fertilized when from seven to eight days old, when the weather was favorable.

If the above is correct, and I believe it is, then it will be seen that we shall want flying or mature drones in 17 days, at least, from the time we start our queen-cells.

I have not as carefully observed the time of the maturation of drones as I have that of the queens, but from the same observations I have made along this line, I find that the drone is in the egg and larval form about 10 days, or one day longer than the workers, and about 14 days in the chrysalis form, making a period of about 24 days from the time the egg is laid to the emerging drone.

From six to eight days after the drone emerges from the cell it goes out for its first flight, to void excrement, mark its location, etc., similar to what the worker-bees do, which is called their first play-spell, during which they mark their location also. After this first flight they go out every pleasant day from 12 to 3 o’clock, p.m., to meet the queens, if they are to be found, so that we have about 32 to 34 days from the time the queen lays the eggs in the cells, the drone-egg should be laid 17 days, and the court starts the time to which the drone-brood would have to be sealed from six to seven days.

Of late years I never commence to rear queens until plenty of sealed drone-brood appears in my drone-rearing colonies. Usually, I wait longer than this, the rule which I usually follow is, that if the chrysalis drone commence to change from the white

The Premiums offered this week are well worth working for. Look at them. (Continued next week.)
color of said chrysalis while in its first stages, to the purple color of its later stage.

And now pardon a word regarding very early queen-rearing. My advice is, don’t do it, unless you are willing to treat the colony as a new nuc, and set it up just as you would a new nuc. I have done this, many times during this past season, and I catch a king treats a new-born heir to the throne, for any neglect on your part will almost surely result in very inferior queens. Very early queen-rearing generally results very unsatisfactorily in this locality, and I have found in this respect of the colonies used for this purpose have to be petted and pampered, by way of feeding, often in very unsuitable weather for the breeder to be out in; carried indoor on cold nights, so as to keep up their sugar content, etc., while the colonies used for this purpose are very much neglected by the breeder. The young bees and the queens do not come up to the standard of perfection, unless the care of an old veteran is used in seeing that all the requisites of a perfect development are present, which are very much neglected. This locality has been March, April, and the first half of May. June, July and August are the months, during which the rank and file can rear good queens with the least trouble here at the North.

Onondaga Co., N. Y.

What is Meant By “Cooling Beeswax Slowly”? by J. G. Griner.

It will now seem as the whole difference that existed on the matter of how to produce nice yellow wax will be laid by, or at least as soon as we fully understand the meanings of the terms used. I do not think there would have been any difference at all but what has been clearly defined where the cooling is to commence and where to end. An illustration of the status would be this:

The little mountain stream passing by my house answers many of the purposes of the city water-works. We use this water for washing, rinsing, etc. When it is a little more painful of this water I can notice particles of foreign matter, perhaps soil, vegetable matter, etc., in it, and I have found out, by experience, if I give the water a little time after the hills are passed, the pail settle down to the bottom of the pail. Along comes a gentleman from another clime.

"Nonsense," he says; "after the water has become solid, no amount of cooling will cause any of those impurities to settle. It will remain just as it is forever." And he is right, perfectly right. All the difference is, I was experimenting with liquid water, and the other gentleman had the frozen article in his mind. As soon as we find out what the other means we agree perfectly.

Beeswax “freezes” at a much higher temperature than water, but that does not alter the case any. Particles of dirt or other substances cannot settle any more after it has become solid. I don’t think any person of sense had expected the beeswax to freeze and settle down to the bottom of a pail. Among comes a gentleman from another clime.

"Nonsense," he says; "after the water has become solid, no amount of cooling will cause any of those impurities to settle. It will remain just as it is forever." And he is right, perfectly right. All the difference is, I was experimenting with liquid water, and the other gentleman had the frozen article in his mind. As soon as we find out what the other means we agree perfectly.

In my 25 years’ experience as a bee-keeper it has happened at least seven times that the wax had not melted up wax. With my facilities I have never been able to melt a batch without its coming to the boiling-point. This is exactly the point where the cooling commences, with me. I have explained a number of times in other papers how this cooling (slowly) should be managed. The impurities in the wax must have time to settle while the latter is in a melted and quiet state. I consider the cooling process ended when the wax solidifies, altho my idea may not be expressed properly.

Naturally Built Combs, vs. Comb Foundation—A Reply.

I am only sure to return home from Europe that I have noticed the two articles of Mr. Deacon. of South Africa, published August 10th and 23rd, 1909, in reply to some articles from me publisht in 1897. I had concluded to allow a similar length of time to the next reply, as were put between our former discussions; but some of our friends seem to be impatient for a word from me now.

I still leave aside the very important facts that the use of comb foundation secures straight combs and worker-combs exclusively, altho all who have tried these matters know the importance of them, and Mr. B. A. Hodsell, on page 630 (1909) has already covered these points.

Mr. Deacon lays great stress on Simmins’ experiments as to the cost of beeswax to the bees. I must acknowledge that if I ever read of these experiments I had forgotten them. But they seem to me to be faulty from the start. From experiment to experiment there is a marked difference—just as Simmins himself states—and it is not possible to take these experiments in a similar way to which a king treats a new-born heir to the throne, for any neglect on your part will almost surely result in very inferior queens. Very early queen-rearing generally results very unsatisfactorily in this locality, and I have found in this respect of the colonies used for this purpose have to be petted and pampered, by way of feeding, often in very unsuitable weather for the breeder to be out in; carried indoor on cold nights, so as to keep up their sugar content, etc., while the colonies used for this purpose are very much neglected by the breeder. The young bees and the queens do not come up to the standard of perfection, unless the care of an old veteran is used in seeing that all the requisites of a perfect development are present, which are very much neglected. This locality has been March, April, and the first half of May. June, July and August are the months, during which the rank and file can rear good queens with the least trouble here at the North.

Mr. Deacon is not the only man who has made experiments concerning the cost of wax. Huber, a Swiss, found the nearly 20 pounds were needed, and an additional 30 pounds, according to circumstances. Since that time experiments have been tried over and over, and the lowest report I remember, made on a practical test, is that 30 pounds in freedom, with a swarm, and a new foundation, can, with two swarms of equal weight; but he forgot to take into account the amount of honey spent for the brood reared by the hive to which full combs were given, when comparing that with the cost of wax, and yet he put the amount at 7 to 8 pounds. The quantity would probably have been raised to the general average of 11 or 12 pounds had he taken the brood-rearing into consideration.

The authorities confirm the high cost of comb. Prof. Cook says that his own experiments confirm Huber’s test of 20 pounds being needed. T. W. Cowan (English) puts it at 13 to 20. Cheshire (English) says it takes “many pounds.”

The assertion that wax secreted is wasted when foundation is furnisht, does not hold together. Bees do secrete wax while foundation is being made, and they always have good use for it, for no one ever can furnish them foundation in such shape that they can fill every part of every comb. Any bee-keeper who uses foundation has seen where they put the wax secreted, for it is whiter than the other. There are always plenty of nooks and corners to fill, and combs to seal. But when there are no combs at all, we all know that they have to hang in festoons and remain idle, probably because they have never had the wax secreted, or the wax is secreted, and because there is no room for more honey till some comb is built. So does the queen lose time, when they are hived upon empty frames, and they have to build combs before she can lay.

Mr. D. makes the point made about the expression “drawing out” the foundation. He implies that we mean that the bees get behind each other, and, pulling at each other’s jacket, thus stretch the foundation, by pulling on it. But he surely knows what we all understand by these words. I use them because everybody does, and we all know that the bees manipulate the wax with their mandibles, and that it is quickly done. A comb of foundation given to a strong colony in the evening will often be drawn out and eggs placed in it the next day. Bees are also always remodeling their naturally built combs? When combs are whitened, at the beginning of a harvest, it is very difficult to tell just where the bees began, and we can see that they have remodeled a portion of the old comb to make the new wax out it.

Mr. Deacon denies my assertion of the Americans being practical, and says that they “take an amazingly long time to realize the uselessness of a thing.” I must say that in the matter of comb foundation we are also constantly deluding ourselves, for, besides what they make, they import thousands of pounds of this useless foundation into Great Britain. They are badly in need of a few arguments from our South African friend.

But this manner of denying the correctness of progress, after a long a time as this, is what I call the Hamet, who, 20 years after the invention of the movable-frame hive, still persisted in calling it “a puppet show,” and the honey-extractor “a useless toy.”

And as to the practical tact of our Americans, I feel
free to speak of it, being a foreigner myself, by birth. The honey-extractor, by the way, is a most important acquisition, and came to the American beekeeper with the foundation, are all European inventions, but take the bee-journals of 25 years ago, and see who took hold and improved and made these things practical and put them to use. Americans, of course. The European bees only followed. Hancock Co., Ill.

The Afterthought.

The "Old Reliable" seen thru New and Unreliable Glasses. By E. E. HASTY, Richards, Ohio.

THINK NEITHER HONEY NOR SUGAR CAUSED IT.

That life-insurance doctor on page 809, he was presumably wrong in crediting sugary urine to the consumption of honey. Moreover (altho a defiance of authorities, and possibly a sad sight of legs to agree with the honey-extractor), he makes a pretty decided statement of my private opinion that neither sugar nor honey had anything to do with it. Pestilential old-grannyism has not all been eliminated from medical practice yet.; and I don't feel that the present war had any better founded than the warfare of 60 years ago against drinking water. At that time almost any patient could be depended upon to die if he succeeded (by bribery or otherwise) in getting a cool drink of water.

A THREE-SCORE-AND-FOUR BEE-KEEPER.

Most of us will have to take off our hats and make a bow to Dr. Besse, with his 64 years of continuous beeking. We can't even 8½ about it when the boys all know that our cradles are not yet 64 years back. And the boy who earns a hive of bees this summer, and continues in the business 64 years, with a sort of hive and manipulation will be arrive at A. D. 1965? Page 811.

TONGUE MEASUREMENTS VS. HONEY-STORAGE.

Ancient the paper of J. M. Rankin, of the Michigan Agricultural College, I will confess that I have felt all along strong suspicions that dissecting bees and measuring their tongues was a deceptive and unreliable way of getting at things. I had a sort of idea that length depended much on the amount of injection with blood and other fluids incident to life itself. That would, of course, let all fluids loose, that there would necessarily be contraction, and that the amount of the contraction would not be at all uniform—temperature, length of time the bee had had, and other things, playing bewildering roles. Maybe I'm wrong. Don't want to be out of fashion. The idea is in the air—breed from bees whose tongues measure high. Measurement, if it is even approximately reliable, is much more to the point than honey-storage. The last may be hopelessly fortuitous, except to long and skilled experiment, while the former gives us something to go by at once if we want to improve our bees. Get the tongues, and sooner or later the tongues will get the honey. The way the public respects you with the honor of repeating that the colony seems to be reassuring. But the millimeters are rather grudging to us. Few of us have any mental picture within as to how short meters or how long meters they may happen to be. I'll come to my own case and you yours by figuring out that the best 24-pound bees were snouted up to over 23 hundredths of an inch, while the yellow 153 pounders scored less than 20 hundredths—the exact figures being .236 plus .197 minus, respectively. We think we have had but few published measurements of this sort to beat .236. And .197 is not a bad measure. Page 812.

SEEING ALL OF THE 20TH CENTURY.

"In all probability very few now living will see all of the 20th century," Editorial, page 519. That, tut, dear George W. ! That's not the way to talk it. To defeat the microbes and add 50 years or more to average human life, is not half so wonderful a triumph—not half so wonderful a medical triumph—as some the nineteenth century won for us. Don't start out by telling us that the twentieth century must, of course, do less.

Mr. O. O. Poppleton, of Florida.

We are pleased to be able to present on our front page this week a most excellent picture of O. O. Poppleton, of Dade Co., Fla. He was born near Green Springs, Ohio, January 13, 1853. In 1855 he bought a farm in Dade Co., where he lived until 1887, when he went to Florida, on account of his health. Excepting about two years at Oberlin College his education was obtained in the common schools. In October, 1861, he enlisted as a private in the 7th Iowa Infantry, and re-enlisted as a veteran in 1863. In February, 1864, he was promoted to a lieutenancy, and a few months later was made regimental adjutant. While performing his duties overwork resulted in eye-trouble, which has seriously affected his health ever since. After the war he went to farming in Iowa, and married a Miss Groom, who died 12 years later, leaving him two daughters.

Dec. 6, 1881, he married Mrs. Mattie Herrick, of Ft. Washington, Ind. Owing to poor health for two very severe Iowa winters, they went to Florida during the cold seasons for several years, where they found the change of climate, with outdoor living, greatly improved his health. In 1895 he married a Miss of Dade Co., and was first married he was given a colony of bees in a box-hive. It so happened that in the winter of 1869 he became acquainted with a bee-paper that is now extinct. He was very much interested in it, and very soon obtained all the literature there was. He then had a sense that there was a better way of handling bees than in box-hives. He soon obtained movable-frame hives, and in a year or so he had quite an apiary, which, in common with many others, was almost destroyed by bad wintering in northern Iowa. But he, of course, overcame the trouble by forethought. On account of such poor health he made no effort to do a large business with bees, but kept from 75 to 150 colonies, spring count, and devoted himself almost exclusively to the production of extra strong honey. For the last ten years that he lived in Iowa his annual crop averaged 110 pounds per colony.

More than 25 years ago he discovered the value of chaff as a winter protection for bees. He discovered what was a winter protector about the same time. For several years he was vice-president of the National Bee-Keeper's Association, president of the Iowa State Association, and honorary member of the Michigan Association. He has ever been a careful observer of his bees, thinking and adhering to plans which he had found successful.

Over ten years ago Mr. Poppleton kept bees for two years in Cuba, the Dussag apiary in his charge containing from 400 to 500 colonies. During the winter of 1888-89, 336 colonies gave a crop of $2,000 pounds of extracted honey, or about 130 pounds per colony—a larger gross yield from one locality, but less average yield per colony, than has been frequent with him both in Iowa and Florida.

On removing to Florida in December, 1889, and looking over the situation, he decided to practice migratory beekeeping, keeping his bees at what is now his home in Dade Co., on the banks of the St. Lucie River, from October to June, and Hawk's Park from June to October. His home was the best winter location, while at Hawk's Park was the best-known field for black mangrove in the State. The two locations were about 150 miles apart by water, and the bees were moved on lighters drawn by steam-tugs. His losses in all this moving were no colonies at all, about one-half dozen combs broken down, and a few dead bees in some of the hives. The four seasons he kept bees in this way gave him average yields per colony, spring count—27,188, 27,182, and 380 pounds; and fall count—314, 275, 194. The mangrove was frozen down so badly in the winter of 1894-95 that he has changed the location of his bees to a place 35 miles north of his present home—a location with some black mangrove, but much inferior to the Hawk's Park location.

His average yield since 1894 has been some over 100 pounds per colony—about the same as he used to get in northern Iowa.

Owing to the poor health which drove him to Florida, Mr. Poppleton has not tried to do a large business, but has kept only bees enough to give him a fair living. He also
has a small patch of pineapple, giving from 25 to 100 barrels of fruit annually. He will increase the acreage of this fruit in the near future.

Mr. Poppleton’s wife died about five years ago. His remaining family is a married daughter and her two children living in Florida, about 70 miles north of where Mr. Poppleton’s home is in Dade County; he has also an unmarried daughter living near his old home in Iowa, taking care of her aged grandfather.

Referring to his migratory bee-keeping and methods employed, Mr. Poppleton wrote us as follows:

**MIGRATORY BEE-KEEPING WITH A GASOLINE LAUNCH**

Moving bees on the water has been a favorite method since ancient times, wherever migratory bee-keeping was practiced. Nearly all the different kinds of boats known have been in use for that purpose. Of late years a favorite plan has been on lighters towed by steam-tugs. These are all right if one could always secure them just when needed. Some large sailboats, which are quite cheap to use, but quite uncertain and unsatisfactory. I have tried both methods within the past ten years, but found them faulty for the reasons given.

About two years ago I had built for me the launch “Thelma,” probably the first gasoline-power boat in America that was designed and built especially for general apiary work, such as moving bees from one location to another, carrying honey to the railroad, going from one apairy to another, etc. She is 26 feet long, 6 feet 5 inches beam, and is driven by a 3 horse-power “Globe” electric gasoline engine. She is what is known locally as a “skipjack” model, giving for a boat of that size a low and large floor space, some 50 square feet of the latter aside from the engine-space. She will carry at a time about three tons of honey, or about 30 colonies of bees in single-story Langstroth hives. Her speed is about six miles an hour on an all-day run. The engine-power is smaller in proportion to the size of boat than any other boat I know of. To have put in the next larger size of engine would have cost $300 more, first cost, and 30 percent more per mile to run, and added not to exceed 25 percent to the speed. It costs about 2½ cents per mile to run for gasoline, electricity, and oil, or less than the average railroad fare for one person. At least 20 people can ride in the boat at one-time with comfort.

The picture of the boat shown herewith was taken last summer at Fort Pierce, while on our road home from Indian River Inlet with a load of bees.

The boat can also be used for pleasure-trips. Within the past month a nephew and niece from Ohio were visiting me, and the three of us spent nearly two weeks in cruising a hundred miles down the coast and back, stopping along as we pleased, to hunt fish, view tropical scenery, etc. We had a gasoline stove, cooking utensils, dishes, and beds, in the boat, and made it our home while gone.

The boat is quite a different model from any other heretofore in these waters, but has been so generally successful for an all-purpose boat that one other has been built of the same style, and others soon will be. It would be very unpleasant for me now, if I should have to go back to the use of a sailboat or hired steam-tugs.

Dade Co., Fla., Dec. 18, 1900.

O. O. POPPLETON.

We might add in concluding this sketch of Mr. Poppleton, that we have had a personal acquaintance with him for some years, and count him as one of the best in all beedom. We have often tried to get him to contribute regularly to the columns of the American Bee Journal, but on account of his eye-trouble and general poor health he has been unable to undertake the work.

We hope that he may be spared many years to the remaining members of his family, and to the host of beekeeping friends who appreciate his character and his efforts in behalf of advanced and progressive methods in apiculture.

---

**Questions and Answers.**

**Introducing Queens—Supers on in Winter.**

1. Will it do to introduce queens during the winter months where the old ones are too old to be of any use, or where the queen has died and left no brood? I am a beginner, have 30 colonies, and fear that there are some that need new queens.

Answers.—1. Better not do anything about introducing queens till spring. It will be very hard for you to tell now whether a colony has a queen or not, for there will be on brood in the hive in most cases, even with the best of queens, and you may lose queens by trying to introduce now.

2. They are probably all right so far as the bees are concerned. But if you mean you have left on supers with partly filled sections, it will be rather rough on the sections. They will likely be darkened too much for first-class sections. But it will be hardly wise to disturb them now.

---

**A Question on a Honey-Deal.**

A sold to B 20 barrels of honey, B to pay A prompt cash on board the cars at A’s railroad station. A delivered the honey at the station in good condition. Was it a fair deal? We made a claim on B's station one barrel had the head knocked out, and the contents all gone. B made claim on the railroad company for the barrel of honey, and insists on A waiting for his pay for that barrel until he gets it from the railroad company. A insists that the honey was B’s as soon as it was delivered at the railroad station, and B should pay. A does not put on the rail for the barrel of honey, who should be the loser?

---

**Judging Queenlessness and Winter Stores Externally—Management with More than Two Stories.**

1. Is there any way of knowing from external appearances if a colony is queenless? Are there any simple and quickly decided methods of determining if a queen is present or not?

2. How is a colony run with more than two stories—a body and a super? Does the queen circulate between the first and second, and a queen-excluder on top of the second, and the honey stored in the third story? Or should there be an excluder on the top of the first, and honey stored in the second and third? If so, is there any advantage in it? Why not use only the second story for surplus, and extract as often as is necessary?

Answers.—1. None. It is easy to tell the hive, and at this time of year it may not be easy to tell them, for queens are not likely to be laying now in the North. But you can judge something from the outside. If there comes
now a day when bees fly, and you find the bees of a colony may rove for the other side as if hunting for a queen, or if they continue uneasy after the other colonies have stop flying, and have settled down to quietness, you may at least entertain suspicions of queenlessness. If you pound on a hive while holding your ear to it, there will be no noise from the bees, and then a prompt quieting down if their queen is all right. It will be something more like a wall if they are queenless. In the working season you may be somewhat suspicious of a colony that appears very listless, and carries in the hive or no pollen when other colonies are carrying in big loads.

2. If you find out the weight of a hive with its combs and a good store of pollen, then add to that ten pounds for the weight of the bees, you will be pretty safe in counting that any excess over this is honey. One of the best ways to tell how much honey there is in a hive is by actually lifting out the combs and seeing how much honey is present. Even then you may not be so very exact about it, for you can tell how many cells have pollen under the sealed honey. The safe way is to make allowance for a liberal amount of pollen, for there is little danger of harm being done by too much honey in the fall or beginning of winter.

3. Sometimes one story is allowed for the queen, then an excluder, then one or more extracting stories. Sometimes the excluder is put over the second story, allowing the queen to use two stories. If 8-frame hives are used, the third story is often an upper hive and if double hives are used. You can use a single story for extracting frames, but that makes it necessary to extract oftener, and makes it more difficult to have the honey well ripened. If any residue is left after the frames are extracted, it may be a bad plan for you to extract only half the combs at one extracting, then the other half at the next extracting, and so on. That will give less chance for unripened honey, but will make you extract oftener than if you extracted all the frames at one time.

Removing Bees from the Side of a House.

A neighbor has a large swarm of bees in the side of his house, and wants them taken out. How could I drive them out and save them? I would like to drive them into a hive. I am told that some medicine will drive them out. They are very cross, but are wonderful honey-gatherers.

CA. LIFORNIA.

Answer.—The fumes of carbolic acid are very offensive to bees, and if enough of the acid is poured into the place it will drive them off. If this is not likely to be held at the place where they come out, they would probably occupy it promptly, and if it could then be put into a hive, and the hive be placed so that the bees could run right into the entrance of the hive as they come out. Other than this, the effort to drive them ought to be successful. There is a possibility, however, that there is so much room where they are that they would merely move to another place away from their comb, and you would be no better off than before.

If so, there may be no certain way to get them out without cutting away part of the wall and cutting out the combs, removing bees and comb together.

Sections Open on Four Sides—Packaging Material.

I am about to buy my bee-supplies for this year, and would like a few points.

1. Is there any advantage in using sections open on all four sides? I used them last year; my notion in doing so was that it gives the bees free access to any part of the surplus department easily and readily. With sections open on two sides the bees will go to the farthest part of the department if held at the place where they come out, they would probably occupy it promptly, and if it could then be put into a hive, and the hive be placed so that the bees could run right into the entrance of the hive as they come out. Other than this, the effort to drive them ought to be successful. There is a possibility, however, that there is so much room where they are that they would merely move to another place away from their comb, and you would be no better off than before.

2. Is excelsior good for the surplus department in winter?

3. Is the cork that grapes are packed in good or better than excelsior? I can get all I want of either cork or excelsior.

NORTH CAROLINA.

Answers.—1. Some think that sections open on all four sides are better, for the reasons you give. Perhaps there may be some advantage in it, but it can hardly make very much difference, for if I am not mistaken, most bee-keepers cling to the sections with openings at top and bottom, and sides closed; altho some years ago much was said about sections with four bee-ways, and if they were much better they ought to have come into general use. If a bee with a load of honey were to enter a super for the first time, and should get into a section already entirely filled, it would no doubt be a convenience to have a side passage directly into a section still offering room. But that is hardly the condition. Mr. Doob- lington has said that depositing the honey in the sections, but that the field-bees dump their loads in the first convenient place in the brood-chamber, and then a set of bees that do not go afield carry from below into the sections. Is it not probable that these inside carriers are quite familiar with the room upstairs, so that they may go generally to those parts of the super where they are sure there is room?

2. Excelsior, if dry, may answer for packing, but planer-shavings are generally preferred to excelsior, possibly because the planer-shavings are more compact.

3. Ground cork is one of the very best things for packing, and is considered away ahead of excelsior.

Feeding Bees in Winter.

What is the best way to feed at this time of the year? I have three colonies in the cellar, and three on the summer stands packed in chatt. Is it best to feed syrup, candy (if candy, what kind?), or granulated sugar dry?

ILLINOIS.

Answer.—The best way is to do your feeding as soon as possible after the bees have stop gathering, whether that be in August or later. But sometimes circumstances are such that we can not do what we would like, and then we must do the best we can. Certainly it would be unwise to waste a honey surplus that might not soon be seen. Don’t think of feeding syrup now. Giving combs of sealed honey is much better. But in all probability that’s about as good advice as telling you how to feed last August, for it’s a pretty safe thing to assume that you have any comb of sealed honey. Granulated sugar dry would be little better than so much sand. The bees couldn’t do anything with it. Candy is the thing, the best perhaps being the “Good” candy, made with powdered sugar and extracted honey. What I mean by it is that when you take it away, only you might then burn it, and that would make it poison for the bees, and stir into it all the powdered sugar you can. Then knead it like dough, adding all the sugar you can work in till you have a stiff dough. Put a cake of this, perhaps an inch thick, over the brood-frames, and cover up warm. Plain candy, made of granulated sugar, the same as any confectioners makes, will also do.

Robbing—Making Comb into Beeswax.

1. Will bees on the side of a hill rob those below, say about 50 feet lower, and about 400 feet apart?

2. How can one make old comb into beeswax?

MAINE.

Answers.—1. Such location would make no difference in the matter of robbing. Bees are just as likely to rob those below. Other conditions than those of position are responsible for starting robbing. A queenless or very weak colony is likely to be a victim, and the case is aggravated if there is too large an entrance, or if the appetites of the robbers are whether they having combs or honey exposed so as to give them a taste.

2. A good solar extractor is perhaps the best thing. You may have something to act much in the same way by having an old dripping-pan and a clothes-iron. Put one corner of the dripping-pan in the oven of the cook-stove, with the split corner projecting out. A little stone, or something of the kind, should be put under the end of the dripping-pan that is inside, so as to make the wax run toward the split corner. Of course, the pieces of comb must be laid in the dripping-pan, and the door of the oven must be left open. Whether you use the dripping-pan or the solar-wax-extractor, if you pile on a lot of pieces of old comb you will find that they will not melt at all, but will act like a sponge, and will be filled with wax that you will not get. There will be less waste in this way if you put in your pan only a single thickness of comb at a time. A good way is to soak the combs thoroughly before putting them in the pan. Then break them up and pile on what you like. The cocoons being already filled with water can not become filled with wax as they would if dry. A dish must be set on the floor to catch the wax as it drips from the pan, and it is well to have in the bottom of this outside vessel a little hot water.
Wintering Well—Prospects Good.

Bees are wintering well, while early snow preceded by soaking rains blan-keted the best start of white clover we have had for several years. The prospects so far are not too bright, however.

The "Nameless" Bee Disease.

The past year has been a poor one for bees, but I think mine gathered enough to carry them thru the winter. I had a little experience with the "Nameless" bee-disease last fall. One colony was so bad that it could not de-fend itself from robbers. I covered the hive with a sheet of glass and changed the stands, and the next spring there was no sign of the dis-ease left, and last fall they seemed to be as good as a colony of Have. A Bee-keepers' Institute.

The bee-keepers' institute was held at Johnstown, N. Y., Dec. 18, 1900, and a goodly number of bee-keepers were present.

The meeting was called to order by one of the State bee-inspectors, Cha. Stewart. Mr. W. Z. Hutchinson de-livered an able address on "The Use and Abuse of Comb Foundation," and an interesting discussion followed.

At the close of this meeting an associa-tion was organized for Fulton and Montgomery counties, and the following officers were elected: President, J. W. Hoffman; 1st Vice-President, G. H. Adams; 2d Vice-President, E. W. Ream; 3d Vice-President, G. W. Haines; Secretary and Treasurer, W. C. Dugdale, West Galway, N. Y.; and Treasurer, D. E. Floyd. A number of members were received, and the next meeting will be at Fonda, N. Y., the first Tues-day in May.

Managing Bees—Cariniolans.

I ran three of my colonies last season on a different plan from what I have been doing, and got $45 worth of No. 1 comb honey from the three, and I am going to try the same thing the com- ing season, and if it comes out all right I will give you the plan.

I had a colony of Cariniolans which had one super on early in May; I was thinking of slipping another one under it, and before I got ready to do so a swarm invaded our place with some dis-tance before it settled. After it clus-tered I hived it and brought it home.

It was a powerful swarm. In a day or two I was able to catch it and get it out on a line. It was a stream of bees going in and out at this new colony. I did not at first think much about it, because I knew it was a very large swarm and thought they were hustling, and concluded that those Cariniolans were dandies. When I finish my work I went over to look

PLEASE MENTION BEE JOURNAL WHEN WRITING.
at them. I had placed them about 100 feet from the parent colony, and I noticed that instead of going to the fields the bees were going in a circle to the parent hive. I look into the parent hive and found that the swarm had taken all the honey from that hive and stored it in their own in the old combs I had given them. I let them alone, and on the fourth day all was quiet. Before the parent colony had rallied, it came thru the winter all right, and the next spring I sold it for $9.00. I secured a fine crop of honey from the new colony this season.

JOHN W. BAUCKMAN.
Fairfax Co., Va., Jan. 7.

Not a Successful Bee-Year.

The past year was not a very successful one with bees in this part of the country. They did almost nothing, and stored so little surplus that we may as well say that the crop was a failure. They were so light in winter stores that I had to do a great deal of feeding. They may have done enough to carry them thru till next spring, and I may have to feed again. White clover failed to yield any nectar, but we look for better things next coming season.

Don't forget to send us the old American Bee Journal, for if the season was poor I think I can't get along without it, so keep it moving along.

Not Much of a "Greenhorn."

We secured about half a honey-crop here last season.

I began keeping bees in the fall of 1895, and last spring I had 31 colonies, spring count, which I valued at $4.00 per colony, which would make $124 invested; I then put in $15 worth of foundation, paid $4.00 for help, and

Langstroth on...
The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for $1.25, or club it with the American Bee Journal for one year—both for $1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with $3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.

BEE-KEEPERS!

Owing to my health, I am compelled to abandon the manufacture of the GOLDEN COMBINATION HIVE, and bee-keepers wishing a perfect sample hive, complete, will do well to order soon, as my large lot on hand will soon be exhausted. Write for prices and instructions, free.

Seem To Be Wintering Well.

Bees are flying to-day, and seem to be wintering fairly well.

ELEVERT W. HAAG.
Stark Co., Ohio, Jan. 11.

Poor Season—The Bee Journal.

The past has been the poorest season for honey in this locality in many years. I secured 26 good colonies in two-story 10-frame hives, and they nearly filled the supers.

I would not think of getting along without the Bee Journal. I have read and reread three of the standard bee-books during the last year, and am well satisfied that the copies of the Journal for the past season were worth more to a beginner than all of these books put together. The text-books are all excellent, and well fill the place for which they are intended, but the amount of original thought and experience which we get from conventions and otherwise thru the Journal are above everything else.

D. R. SALSBURY.

Smallest Crop In Years.

We had the smallest honey-crop in this county the past season that we have had in a number of years; in many apiaries the bees stored no surplus. The goldenrod and wild aster yielded no nectar, and the oldest beekeepers say that this never happened before in this "neck of the woods."

Our bees had their last flight Nov. 6th, and we may be in winter quarters until April 1st. Many colonies are very light in stores. We winter them in the cellar, and they are not large in number.

We had plenty of warm rains late in the fall, early snows, and no frost is in the ground. The clovers are doing well, and we are sure of a big crop next season.

W. R. H. GRAM.
Barron Co., Wis., Jan. 7.

A Canvassing Experience.

If every one could get as much fun out of canvassing for new subscribers as I have, I think you would have plenty of agents. I called on one old gentleman, and, after showing him the Bee Journal, I told him that if he expected to be successful in keeping bees he should keep posted and read a bright, wide-awake journal. His reply was, "Look here, Donaldson, I have been keeping bees for years and I have forgotten more of them than you know. I tell you it's all luck." I then asked him if he happened that my bees came thru the winter all right when beekeepers around me lost all that they had. He replied, "You were lucky; that's all there is to it." I thought my next question "How have so many probably he accounted for the fact that I secured a good honey-crop when others did not get any. He replied, "Tell you it's all luck," you'll see, your luck will change, too. I had just as good bees as you have, and the first thing I knew they were all gone. The worms ate them all up." I concluded he was a hopeless case.

Bee-wax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

H. HOWARD M. MELBEE, HONEYVILLE, O.

(Take this cut is the full size of the Knife.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Enclosed in this celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very best English rat-tooled, and we warrant every blade. The hoes are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle ab described above. It will last a fast-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

(See page 72.)
THE BEST WHITE

ALFALFA

Extracted Honey

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

We have a good stock of the fine WHITE ALFALFA and WHITE BASSWOOD EXTRACTED HONEY that we can ship by return freight. Most bee-keepers must have sold all their last year's crop long before now, and will be ready to get more with which to supply their customers. All who have had any acquaintance with the above-named honeys know how good they are. Why not order at once, and keep your trade supplied?

Prices of Either Alfalfa or Basswood Honey:

For the purpose of selling again.

A sample of either, by mail, 8 cents; samples of both, 15 cents—
to pay for package and postage. By freight—1 one-pound can, 95
cents per pound; two cans, 9 cents per pound; four or more cans, 85
cents per pound. Cash must accompany each order. If ordering
two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

Absolutely Pure Bees' Honey,

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own pro-
duction and then buy honey of you for my own use. But however loyal one ought
to be to the honey of his own region, there's no denying the fact that for use in any
kind of hot drink, where one prefers the more wholesome honey to sugar, the very
excellent quality of alfalfa honey I have received from you is better suited than the
honey of more market flavor, according to my taste.

C. C. MILLER,
McHenry Co., III.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

26 cents Cash paid for Beeswax. This is a good time to send in your Bees-

wax. We are paying 26 cents a pound-

CASH—for best yel-

low, upon its receipt, or 28 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
Editorial.

Removal Notice.

Beginning Feb. 1st, our place of business will be at 144 & 146 Erie Street, instead of 110 Michigan Street. Our correspondents, and customers who are in the habit of calling at our office, will please note this change in location.

After our loss and general disturbance here, caused by the fire in this building on Jan. 1st, we concluded it would be best for us to seek another location. We had little trouble in finding what we think will suit us exactly.

The new place is on the first or ground floor—so there will be no more stairs to climb, as is the case here. Also, there will be no need for a freight elevator at the rear, on which we have had to load and unload all our goods the past eight years. This will save considerable handling. We will have a larger floor space at our new location, so we will be able to have everything on one floor, instead of on two as has been the case here a part of the time.

Our new office—144 & 146 Erie Street—is just a few short city blocks (about 100 rods) due north of the Chicago & Northwestern Railway Passenger Station on Wells Street. We will be just about midway between Wells Street and Franklin Street on Erie Street.

We think now none of our friends who come to the city will experience any difficulty in finding us.

Come and see us in our new business home—after Feb. 1st. George W. York & Co.

Bees and Fruit—The editor of Green's Fruit-Grower—Mr. C. A. Green—offers the following testimonial to the value of bees to the growers of fruit:

"But as regards bees injuring fruit, there is no doubt in my mind(163,725),(991,745)

The Editor, in commenting on the above paragraph, writes:

"In my humble judgment the decision of the Utter trial was worth more—nowadays more—than it would have been in the case of the evidential important as that was. If the decision in the first-named had been against us, and let there, bee-keeping might have been wiped out of many fruit sections of the United States. The Arkadelphia case related only to bees in town and vicinity; and if that had gone against us it would have wiped bee-keeping out of the great centers of population only, but could not have affected it in the least in the great acres of country half a mile and more from those centers. Why, it seems to me that the results of the Utter trial are worth thousands and thousands of dollars. If the National Bee-Keepers' Union, the United States Bee-Keepers' Union, or the North American Bee-Keepers' Association, now all merged into one, had never done any more, we could still feel that the money that has been put into the several treasuries was well invested.

We agree most heartily with all the foregoing. Of course, there are many bee-keepers who think that they do not make a sufficient business of bee-keeping for it to be worth while for them to join the National Association. We think, however, that they are making a big mistake. No one can tell just when he will have to meet the same kind of opposition as did Mr. Utter, the bee-keeper. It pays (to be prepared) in advance for any such attack. But even if it were unnecessary to defend yourself, you would have the satisfaction of knowing that by joining the Association you were doing good by helping others who are unfortunate enough to be compelled to defend themselves against envious or
The Wisconsin Convention will be held at Madison next Tuesday and Wednesday, Feb. 5th and 6th, in the State capitol building. A portion of the interesting program is as follows:

President's Address, by N. E. France; Celsar vs. Outdoor Wintering, by A. P. Miner; Outlook for Bee-Keepers' Exhibit at the Pan-American Exposition in 1901, by E. D. Uchser; Honey Exchange, by C. A. Hatch; How to Maintain Present Price of Honey in the Event of a Good Honey Crop, by Harry Lathrop; Short Cuts in Extracting, by Frank Minnick; Discussion of Laws Pertaining to Bees, by E. H. Beecher, and Mrs. Evans and Mrs. Towle will each present a paper on subjects of their own selection.

The secretary, Miss Ada L. Pickard, in her announcement, says:

Many of the prominent and experienced bee-keepers will be present.

E. R. Root, editor of gleanings in Bee-Culture, will present his views on the evening of Feb. 5th. These we know to be highly entertaining as well as instructive, and to be appreciated they must be seen. Since Mr. Root presented these at the National Convention he has obtained many new slides, which will prove to be instructive and interesting to fruit-growers as well as to bee-keepers.

A general discussion will follow each topic, and a free use of the question-box and answers will be a prominent and valuable feature.

Execution rates, within 200 miles of Madison, one and one-third for the round trip, ticket purchased Feb. 4th, 5th or 6th good to Feb. 9th. Tickets in Wisconsin, over 200 miles from Madison, same rate if purchased Feb. 4th, good to Feb. 9th.

Editor W. Z. Hutchinson, of the Bee-Keepers' Review, as well as the editor of the American Bee Journal, expect to be present also. We are anticipating a good meeting, Wisconsin bee-keepers should turn out in full force.

Mr. O. O. Poppleton, it seems, has been receiving considerable notoriety recently in several of the bee-papers. About two months ago we received his photograph, expecting to use it in the Bee Journal very soon after, but before we were able to do so we found that the American Bee-keeper had already decided to present his picture, which appeared in the December issue of that paper. Then, just after making up our forms of the last week's Bee Journal, in which appeared Mr. Poppleton's picture, we received gleanings in Bee-Culture, and discovered it there also. So it seems that at least three of the bee-papers had been planning to show Mr. Poppleton to their readers. It is all right, as there is no one in all the ranks of bee-keepers whom they would be more pleased to see than Mr. Poppleton. It was Mr. E. R. Root who said to his son E. R. Root, when he (A. I.) had the editorial management of gleanings in Bee-Culture, "Whenever you see anything from that man Poppleton just hand it right in to the printer. It is always good. He is sound and practical." Editor E. R. Root says he has found his father's statement concerning Mr. Poppleton to be literally true.

Mr. Poppleton, as is known by most of the older readers of bee-literature, uses what is called the "Long-Ideal" hive, the frames being 12 inches square, and from 30 to 34 frames in each hive. These frames are all used in the brood-chamber, and, of course, are run entirely for extracted honey. Mr. Root says:

"Mr. Poppleton himself believes that the hive first devised by Langstroth 30 years ago had been improved upon so far as shape and proportion of frames are concerned, for the production of comb honey. But the producer of extracted honey is so different he thinks it doubtful if the same style of hive and frame can be best for both."

Mr. Charles Becker, as well as other apiarian exhibitors at fairs, hear some queer remarks made by visitors who see the exhibits of honey and bee-supplies. At the Wisconsin fair all the exhibits of Mr. Becker's large exhibit of bottled extracted honey. The old gentleman said to the old lady:

"What is that along there in them bottles?"

"I don't know unless it is an advertisement for a drug-store," replied the lady.

Mr. Becker is a very sweet "druggist."

On another occasion some spectators were strolling along and came to the honey-extractor. One of the company upon inquiring what it was, received this wise answer from another visitor:

"Why, they put the bees in there, and squeeze out the honey."

And yet, some of us are just as ignorant about certain things as were the people referred to in the foregoing concerning common apiarian matters.

Mr. H. G. Osborn, writing to gleanings in Bee-Culture, from Cuba, Oct. 10, 1900, after living there 12 years, advises any one contemplating bee-keeping in that country, to stay at home unless one can first go there and learn the difficulties to be encountered, and how best to meet them; also as to insects which delight to feast on "the rich red blood of the new comb, the very best stimulant for a good appetite." One year he extracted 75,000 pounds of honey from 600 colonies in five months.

Editor Root wisely says: "No one should ever think of 'pulling up stakes'; taking his all, and changing everything in a move to a new locality, much less go to a climate that is essentially different from the one in which he has been brought up."
Contributed Articles.

The Bee-Keeper and the Bee-Supply Dealer.

A Colorado subscriber wrote us as follows: Oct. 16, 1900, and we referred his letter to several bee-supply dealers requesting their opinion on the subject:

TO THE AMERICAN BEE JOURNAL:—

I want to purchase supplies needed for 250 colonies of bees. I don’t know where to buy, for the reason that the business must be transacted by mail, and I object to paying for a large bill of goods that I have never seen. But I can’t help myself. When the goods are manufactured, then counted and shipped, I am not represented. My money passes without control, and I am helpless.

I know all the current answers to my objection; but the answers do not satisfy. The seller is honorable; that does not meet the case. The shipping-clerk is careful; that does me no good after an error is made. An error in shipping can be corrected; but the errors at the points to much; but the error of the man at the saw, if his spoiled goods get shipped, is never corrected. We get self-wooed apologies, but these do not meet the requirement.

In making a rule of business to protect the seller absolutely, we have left the buyer absolutely unprotected. Cash in advance is perfect protection to the seller, but it is rank injustice to the buyer. Cash on delivery of goods, duly examined, is the rule, and several dealers have adopted the plan.

Now, I submit that the bee-keepers, supply dealers, and editors ought to aggregate brains enough to make a rule of business that will protect both buyer and seller. Let us try the problem, at any rate. Will not the sellers of supplies lead the discussion?

COLORADO.

We have received the following responses to the above, from some of our advertisers:

DEAL WITH RESPONSIBLE FIRMS.

I do not consider the dilemma of our Colorado friend a serious one. If he wishes to purchase a car-load of supplies the goods, which will be sent to him at a very low price for the consideration of a quantity order with the cash. This is greatly in the favor of the purchaser. If he places his order with a strictly responsible house his goods will be guaranteed as ordered, and if, by accident, an error should be made to the factory several hundred without expense to him. As a rule, manufacturers and supply dealers are very honorable in their dealings, and if there are any that are not they must eventually drop out of the business.

After giving this subject much thought I can see but one explanation, and that is, to be certain to place the order with a responsible firm.

WALTER S. POUDE.

"COLORADO" TAKES A WRONG POSITION.

We note the copy of letter from your Colorado subscriber, which you have called to the attention of your customers. We agree that the terms of the agreement of a mail order with the cash are an advantageous proposition in this matter, for this reason: If he wishes to purchase a car-load of goods, and can show as good financial standing in the business world as the manufacturer, then he would have no objection to sending him goods to be paid for when examined; but inasmuch as he is not in business, and not quoted in the commercial reference books, he could hardly expect that any one would trust him outright with a car-load of goods unless he could give satisfactory references.

We have never had any difficulty in satisfying our customers in the ultimate settlement of any disputed point, unless it may be with some one who has ordered only a few dollars worth of goods and is simply of that make-up that he would not be satisfied even if the whole amount of money he paid for the goods was returned to him.

Now we would suggest that if this party wishes to purchase a car-load of goods, and, as he says, he is willing to pay cash, that he send the manufacturer one-third or one-half the cost of the goods, and deposit the balance in the bank to be paid for to the manufacturer when the goods have been received and found satisfactory.

THE W. T. FALCONER MFG. CO.

NO RULE CAN BE LAID DOWN.

There is no rule that can be laid down in this matter, as the matter of credit to a strange purchaser by a dealer depends altogether upon the information that the dealer may or may not have obtained concerning the purchaser. If dealers were compelled to trust everybody, they would have to ask a much larger price for their goods to make up for dishonest customers, and the honest ones would evidently pay for the dishonest ones. A few very large orders to understand that good business do not hesitate to furnish good references, and that secures them a credit, so they can see the goods before buying. On a small retail trade, however, it is not advisable to make credit, as it involves too large a correspondence and too much huck-keeping. Between a fair dealer and a fair purchaser, there is not trouble once in a thousand purchases, because the dealer is always ready to take back incorrect goods and replace them, paying freight, too. If the goods are as large or as the dealer is not fair, or the purchaser himself is unjust or gets angry at an error, instead of peaceably representing the mistake which needs correction. But as I said before, it does not happen once in a thousand deals that both parties get so angry that they cannot agree on a satisfactory solution.

As we cut up very little lumber ourselves, but buy much of our stuff already cut from large mills, we are both a buyer and a seller in the goods furnish by the man at the saw, and we find we see very little trouble in getting giving satisfaction.

CHAS. DADANT & SON.

TRY TO DO AS YOU WOULD BE DONE BY.

Your Colorado correspondent is not so badly off as he imagines. In the first place it is not necessary or desirable even, for him to send his order hundreds of miles distant to the factory. He can place it with a large wholesale dealer in his own State, and receive just as good prices as he sent the order direct to the factory.

Again, if he is a reliable and responsible man, and can satisfy the one with whom he places his order of the fact, it is not necessary for him to send for the goods, and he gets them and is satisfied they are what he ordered. Neither the manufacturer nor the dealer wants to have any unfair advantage over his customers. The reason why the rule of "cash with order" has been adopted, is to protect the buyer, but it is rather in his interest in preventing bad debts, thereby permitting of closer prices. If the manufacturer or dealer had the means at hand of ascertaining who were responsible and trustworthy they would not, not many people could be accommodated who, under the present conditions, find it less troublesome to send the amount with the order. We have the means at hand for men in the mercantile business; but not for farmers, professional men, etc., who make up the great majority of customers for bee-supplies.

Even if cash does accompany the order and it is placed with a responsible manufacturer or dealer, the buyer is not helpless if the order is not properly filled. Your subscriber seems to assume that the manufacturer or dealer would more care in avoiding mistakes, the incurring the payment was not to be made till after delivery and inspection—a proposition which is absurd from our point of view. We would have as much right to assume that the buyer would be more critical in his inspection, seeking for some basis as a claim for rebate, if he were allowed the privilege of inspection before settling for the goods. We have more faith in both classes—buyer and seller—than to ascribe to either a low standard of business.

Your correspondent says, "Errors of the man at the saw, if his spoil goods get shipped, are never corrected." That is a pretty sweeping statement which we think he would find it difficult to prove. We can cite him to numerous cases in our experience, that have been made to modify it. We always try to do as we would be done by, whether goods are paid for or not. Occasionally a man takes so unreasonable a position as to make it impossible to satisfy him; but we usually satisfy our customers.

THE A. I. ROOT CO.
Honey-Dew—Extracted Honey Question.

BY C. P. DADANT.

I HAVE received the following to be answered in the American Bee Journal:

Mr. C. P. DADANT.—Would you be kind enough to answer a few questions about the product of the com-pressed or enclosed honey, known as "honey-dew," or "honey-flow," in the majority of bee-keepers, and always get it. A customer of mine bought nothing of me last season until September. I find he had bought elsewhere at a less price, but admits that my goods were best, and again orders of me at my price, without making a single objection, as "Colorado." Every supply dealer and manufacturer should be able to establish a character beyond any question, by the best of reference. I deal with hundreds of customers every year—any an easy matter for every one of them to get my standing within a week, but it is an utter impossibility for me to find out the character and standing of all my customers. If every bee-keeper was honest and fair, then it would be perfectly safe and right for any reliable firm to submit goods for inspection before payment. But it is a melancholy fact that bee-keepers have their regular proportion of people who are dishonest, unfair, and cranky, as every dealer knows. We must protect ourselves against this class both by care with which we order the firm until after having established a character with a firm, we sometimes make exceptions. But this does not protect us against losing customers, and we are forced to do the right thing the hard way.

Why should I, as a "manufacturer and dealer," "contribute any brains to make a general rule of business that will protect both buyer and seller?" Why should I contribute to make it perfectly safe for my customers to order of my reputation? If I have given them satisfaction and no cause to complain, let them keep on buying of me, and if they want to try the other man let them take their chance, and not ask me to make it safe for them to try him.

If it were a rule to ship goods on approval, we would be at the mercy of the Chinaman from ordering from several concerns and selecting the best, as he sees it, and refuse the others on some pretext? We would never know, and if we did would have no redress. What protection would we have against a chronic crank and a fault-finder?

Such conditions as Colorado complains of, while it is liable to happen to any firm, and in fact do happen, are exceptions. Where they are a rule, they will soon be established, in which case the reputation of a man is destroyed, and in the case of exceptions that happen to good firms, it is hardly worth considering a general rule as proposed.

Let each firm do business on a principle that will satisfy the buyer and the seller. If I have given them satisfaction and no cause to complain, let them keep on buying of me, and if they want to try the other man let them take their chance, and not ask me to make it safe for them to try him. It is only those that mistrust everybody else that we ever have any trouble with.

I have for a number of years shipped all of my honey to one firm, for the reason that I have confidence in their honesty, and I let good enough alone.

The only general rule should be with the publishers. Hold them responsible for the character of their advertisers. They are making money by it, why not then they can afford it considering what we have to pay. Let it be an understood rule, that the appearance of an advertisement is a guaranty for the character of the firm.

GUS O'TTERBEE.

LATER.—I had thought that perhaps I had been a little too hard on "Colorado." I have just read the editorial on "A Dishonest Advertisement," page 691 (1900), and I am more than ever confirmed in the position I have taken. We must protect ourselves against that class of bee-keepers, and the honest must suffer in consequence. G. D.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by writing in the names and addresses when writing us on other matters.

Honey-Dew—Extracted Honey Question.

BY C. P. DADANT.

I HAVE received the following to be answered in the American Bee Journal:

Mr. C. P. DADANT.—Would you be kind enough to answer a few questions about the product of the com-pressed or enclosed honey, known as "honey-dew," or "honey-flow," in the majority of bee-keepers, and always get it. be drawn off thru a faucet without having to move the tank. For a crop of a few hundred, or even of a few thousand, pounds, this is certainly good. We sometimes have unripe honey, and I know that such honey would be beneficially standing in an open tank in hot weather. But if the crop is harvested at the right time, there is usually no need of artificial ripening. There are seasons when the weather is damp and the crop is so watery that it even ferments in the combs before harvesting. No amount of ripening will help such honey.

3. We always return the combs to the hives to clean them. If there is no honey in the fields at the time of extracting, we wait until evening to return the extracting supers, so that the bees may not be incited to rob. About sunset is a good time, and if any excitement prevails it dies out before any damage is done. The next morning all is quiet. In a good season, when the bees are still at work, the combs may be returned at once, that is, the combs of one hive, that have just been extracted, are exchanged for those of the next, and so on, till the end of the day.

We have tried keeping the combs over, from one year to another, without giving them back to be cleansed—we do not like it. They are sticky, and leak more or less; they attract mice and robber-bees, and the liquid honey that sticks to them is likely to sour. Then when spring comes, if we happen to put them on the hive during a day of short crop, we have some risks again from the excitement caused, and some danger of robbing.

4. Yes, if your colonies are strong, the combs are better off on the hives during the summer than in the honey-house or anywhere else. Even if there is no crop, the bees take care of them and neither mice nor moth can touch them. But we must not leave a lot of supers on a weak colony. That would be an error. Some judgment must be used in this as in any other thing. Let us always remember that successful bee-culture is made of many little details, and that the most careful man is also the most successful.

Queen-Rearing on a Roof—Feeder and Liquefying Granulated honey.

BY JOHN R. SCHMIDT.

Queen-Rearing on a Roof—Feeder and Liquefying Granulated honey.

BY JOHN R. SCHMIDT.

So much has been said already about bee-keeping on a roof, and especially as this has been my subject quite often it is really becoming one of the "old chestnuts." It is about time this subject were buried, at least long enough to allow the readers to recover from the "too much of one thing" malady which creeps into our periodicals so often not only on our literature, but in many others as well. For instance: Not long ago while talking to a photographer who has made a success of his profession, I chanced to ask him which is the best photographic journal publisher. Pick one of the high-priced journals and turning to the frontispiece he said: "Here we have an example of composition and lighting that we buried 20 years ago, and it is the same with many of the articles as well—the rethreshing of the same old things until we actually do not care to read them."

The only excuse I have for bringing an old subject before the readers is, that it introduces something which heretofore to my knowledge has never been attempted on a large scale, viz: The rearing of queen-bees for the trade. The illustration hereafter is a photograph of the C. H. W. Weber apiary, and again shows a few of the nuclei used last season to accommodate some of the queens. It has been suggested that the only sure way to get queens properly mated is to establish an apiary on an island, away from other bees, and even to accomplish this desired result a desert was mentioned. Probably this led to the idea of going to the other extreme and rearing them on a roof of the city; anyhow, this has proven to be a capital idea, at least in this city, where house-top apiaries are few and far between. Mr. Weber tested this method of queen-rearing last season and found it to work well, his business having develop to such an extent that a move was necessary to the roof proper, about 20 feet higher, where more room and sunshine could be given the bees.

The same idea of having the hives under cover has been adhered to, as this is important when located on a high roof where the mousetraps, etc., can be placed over the house-tops. It would become a troublesome and often disastrous undertaking to winter hives of bees under any other method, but as it is here, each hive nests up to the second story in a solid packing box, warmed during the winter. A thing of no little importance has been added to these hives. That is, every one has a permanent Doolittle feeder on the north side of the brood-chamber, and manipulated entirely from the outside thru a hole in the top closed with a cork. The arrangement is so convenient that one may feed any desired amount of syrup at any and all times; even in the coldest days the bees may be fed with the same convenience and safety as in summer, the packing not being disturbed in the least. Just pull out the cork, insert a funnel, pour in the feed, replace the cork, and we're ready for the next hive. This is almost convenience itself, and as near being the perfect way to feed as anything could be.

Another thing, every one of the hives under cover has three queens in each—two young laying queens and one old one—living peaceably, too. I believe this was considered impossible heretofore. Can't tell you now (by request) how it is done, but it is an accomplisht fact—nothing theoretical about it.

Liquefying granulated honey.

The sale of liquid extracted honey is another specialty of Mr. Weber's, and to keep it in the liquid state is not an easy thing to accomplish, judging from the amount of granulated honey we see. This localized method of liquefying extracted honey, and to make a success of the business we must give them what they want. Realizing this, Mr. Weber has devised a liquefying tank with a capacity of one barrel at a time. The honey-chamber is surrounded by a water-bath, and the water is heated by a gas stove of special design. The exact amount of water in the tank can be read from the outside upon an automatic register, and as the water is too low a turn or two of a small wheel admits the water thru a sep- a special connection for this tank. Should the water sup- ply become too great that may be turned into a drain pipe, and needs no further care. The temperature of the surrounding water is of great
AMERICAN BEE JOURNAL

importance, and to know to a degree just how hot the water really is, is accomplished by a thermometer on the outside which registers the exact temperature of the surrounding water in the tank. A glance at this will tell us just where we are "at" at all times, and there is no danger of overheating except thru carelessness. Any variation from the desired temperature is easily controlled by the perfect system of heating, and cold water supply. All this will be appreciated the more when it is said this tank is located in the store in full view of all customers and visitors, and its novel appearance excites much curiosity. The honey when re-
liquefied is run into bottles, corked, and hermetically sealed while hot with a preparation which looks like wax, and something especially appropriate and pleasing when used for this purpose.

Is this tank a success? Well, I believe I can safety say it is. Two bottles of re liquefied honey which I saw had been on ice constantly for three months, and after this long time did not show the least trace of granulation. If bottled honey will stand so severe a test as this there is no necessity for educating the people to eat granulated honey. I was told a tank like this does not cost over $100, and it cer-
tainly would be a good investment for many. To see it one would think it cost a good deal more.

Such are a few of the good things Mr. Weber has thought out himself, and if he could be induced to describe them with us we would put a few "wrinkles" into some of the most prolific writers.

Before closing I would like to say that some parts of this article may read like a big puff for Mr. Weber. To all those who think it such, I would say that I write only hoping to give the people a few typical to the reader, and if a person deserves credit for such a thing it is no more than right that he should be mentioned in connection with it.

Hamilton Co., Ohio.

The Conklin Apiary in Rhyme.

By Mrs. J. A. CONKLIN.

In the village of Moravia this apiary is found—
Just out behind the barn are the hives round;
Bondeled on the east by berries, and on the west by hens.
On the north by a vacant lot, a neighbor it depends.

The owner that's at work there, was born in '59;
He stayed on the farm with father until he married me.
We went to farming right away, instead of a wedding trip,
But he hankerred so for honey that one day he bought a "skip."

You all know what the fever is that one swarm brings to men—
Well, I guess the only remedy is to get some more of them.
Mistakes, experiments, and even death didn't break the fever up—
Still on it raging till cooled by drink of a successful cup.

We finally gave farming up, and to the village came.
But his appetite for honey is very much the same.
Bee-keeping sir—and also wives—those both short and tall,
When passing thru this place we'll be glad to have you call.

OYAHU CO., N. Y., Dec. 19, 1900.

The "Bull-Dog Ant" of Florida in the Apiary.

By PROF. A. J. COOK.

I HAVE been much interested in a correspondence with H. E. Hill, of Florida, regarding a large red ant of that State. Mr. Hill says he has not seen this species in Canada, Cuba, or the United States except Florida. These ants are very serious pests in the apiary, and their destructive habits make it imperative that the bee-keeper give them special attention. Mr. Hill states that he has as many as 19 nuclei in a single week from these predatory ants. This is true not only in the main colonies, but even in the brood frames where the nuclei were fastened on the trunks of palm-trees quite a distance from the ground. A further precaution was also taken of placing a girdle of cotton wadding saturated with carbolic acid around the tree above and below each nucleus.

Districts not cultivated are fairly alive with these ants. They burrow deep in the roots of old stumps, under logs or other pieces of wood, in the grass, between the walls of buildings, in wood-piles, in ventilated hive-covers, beneath the bottom-board of hives, in the vacant space of a con-

tracted hive, between the shingles of old buildings, in rot-
ten portions of tall trees—in short, may be found in any place that affords them a harbor.

Mr. Hill has never counted them but believes that a colony may number several hundred thousands. It is quite common, however, for a detachment of a few hundred to gather in any place affording a safe rendezvous. They are very ready to occupy any convenient harbor near the apiary. Hence the need of great vigilance on the part of the bee-keeper.

It is a curious fact that queenless colonies, or any colony in the apiary weak in numbers, are quick to be discovered by these marauders and are almost certain of attack and slaughter. The bees make their homes in the hive at night-time; and even populous colonies not infrequently succumb to their attack.

I have long believed that ants are to the Archaeopteryx what man is among vertebrates. Even the study of the ant's brain would establish its position at the head of its phylum. Its brain is not only large in proportion to its body, but has a kind of corruagation which reminds us of the brains of our own and those of the other higher mammalia. We know that ants sow seeds, clear the ground, gather and cure their grain, make slaves, and do many other things that indicate high intelligence. It is not surprising then that these proved marauders are a great apicidal of Florida. He states that in the early evening, scouts are sent out in advance of the main army, which select the colony of bees to be destroyed and plundered. These advance agents may be seen running over the hive in large numbers. Such a colony of ants is usually doomed unless removed beyond the reach of the menacing host. Mr. Hill has frequently removed the imperilled colony with the result that an adjacent colony was vacated by the destroyers of this ant.

This method has been the most successful of any tried. Mr. Hill reports that the bees show the utmost consterna-
tion when attacked by these ants. The chitinous crust, with which all ants are very hard, is frequently crushed by this bee-destroyer of Florida. The ant has immense strength, is very agile and alert, and, by use of its sharp, scissors-like jaws, is sure of victory. The hum of distress, and even of despair, made by the bees is so characteristic, that it would be quickly recognized even by the inexperi-

enced.

As before stated, these attacks are always made in the night. During the time of the contest, thousands of ants may be seen running over the ground and the hives near by. The ants grasp the bees and the two may be seen whirling, one over the other, until the bee is hurried from the hive maimed or dead. This hand-to-hand conflict, if we may call it, gets the best of the ants. They do this by biting the leg of the bee, or holding her by the thorax and pulling her up high from the bottom-board between the combs. After the terrible carnage, the remaining ants feast upon the honey which is left in the comb and in the honey-sacs of the dead bees.

The immense numbers of these destroying ants can be easily imagined, as Mr. Hill states that he has burned thousands of colonies during the past two years. They seem to be proof against the use of bi-sulphide of carbon. When this liquid is used, they pick up their eggs and move to new quarters. The free use of gasoline and the torch seems the only practicable way to destroy the destroyers. Mr. Hill has invented a very ingenious way to protect his queens, springing out of a colony of wood ants. He puts them on a stand, the legs of which are so turned that a little basin encircles each leg. This little basin is made impervious by coating it on the inner side with paraffine. By keeping this full of kerosene or gasoline, the ants are unable to pass up the legs and so can not reach the bees. Of course the liquid has to be replaced as it evaporates.

Like all ants, this "bull-dog of Florida" has a sort of scale or hump on its narrow thorax. There are two sizes to these, the common and the larger, which appears to be a soldier. The heads are very large, the eyes round and small, and the jaws very strong and sharp. The entire body has numerous hairs. Except the eyes and the abdo-
men of the soldiers, the entire body of the ordinary worker, which are black, the entire ant is red. As Mr. Hill has not sent me any specimens of the queens, I do not know how they differ from the others except as very likely they are large of still show tubs of wings. The queens of all ants, as also the males or drones, have wings and fly
Questions and Answers

DR. C. C. Miller, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Eds.)

Moving Bees in Winter.

I have an apiary of about 50 colonies. Would you advise me to move them now?

Virginia.

Answer—Without knowing more about the case it is hard to answer. If you yourself expect to move, it will probably be more convenient for you to move the bees a few miles away if you remain where you are, and the pasture is very much better at some place two or more miles away, it may be advisable to move the bees. If you expect to move the bees, and desire only a present present is a good time to move them, it may be said in reply that it will be better to wait till the bees begin to fly in the spring. Still, it is much more convenient to move them now, they may be moved carefully without danger of much harm.

Getting Straight Brood-Combs Moving Bees.

1. As I am a beginner in the bee business, I would like to know what is best way of getting straight combs in the brood-frames? I have 20 colonies, and I wish to run for extracted honey another year. The past year I work for comb honey, so the brood-frames are in such a shape that it will be difficult to extract a great many of them that I would like to get filled.

2. And, furthermore, is it best to contract the space in the hive, when there is an extra frame in the hive that isn’t filled?

3. After a swarming issue, can I move the old colony, say a half mile, without injuring them, to a different place, supposing that the swarm that issued would better be put back on the old stand? The reason that I ask is, I want to have them on the opposite side of the river. I have 30 colonies.

California.

Answers.—1. The very best way to have combs built straight is to fill the frames with comb foundation. That makes sure a thing of it that the center of the comb will be in the center of the frame, and you may make sure at the same time of having all worker-comb.

2. It is not desirable to have any more space in the hive than can be filled by the bees, especially in winter, for it costs the bees extra to keep up the heat in that extra space.

3. Yes, it will be all right to move the mother colony away a half a rod or half a mile. If you want to have the moved colony pretty strong, move it at a distance of 8-10 feet. But if it is to be sold, it is considered good practice to let the old hive stand close beside the swarm for a week and then move it. That makes the swarm very strong, but of course the mother colony is just so much weakened. The other is a matter of personal preference. It is better to make the first swarm strong for surplus. Moving the swarm a half mile will be the same as moving it a short distance, only there will probably be not quite so many bees leave the hive for the swarm, if the old hive is moved a long distance.

Storing Supers—10-Frame vs. 8-Frame Hive.

1. I am anxious to fix my surplus honey house for the winter, but having been deprived of the building I used for a shed, I have no place to store my supers where the temperature does not go much below freezing—in fact, I must leave some outdoors. Thru the kindness of the "gude wife," I can work in one end of the kitchen, but must store my traps elsewhere. Will freezing injure the foundation in the sections, provided they are kept dry and in the dark? By an eye of faith I see a shop and honey-house after next summer's big honey-crop!

2. Why is a 10-frame hive better for extracted honey than an 8-frame, as you advise New Jersey, on page 25? How about two 8-frame hives with queen-excluders between?

Hoosier.

Answers.—1. Don’t be worried about freezing. It’s probably a good deal colder here than where you live, and I’ve had thousands of sections filled with foundation stay in a shed as cold as ours can be in winter but two or more winters, and I don’t think they were hurt by it.

2. One reason for preferring the 10-frame hive is that it is safer for winter. There is more room in it for winter storages. There is not the same reason for restricting the brood-nest at any time for extracted honey that there is for comb honey. The bees will not do anything at comb honey in the supers so long as there is room below. But it is not quite the same with extracting comb above. If you have two 10-frame combs above they will store it in them nearly if not quite as readily as below, and even if the extracting combs are new they will prefer them to sections divided up into little compartments. Of course, you will need more than one story of 10 frames in the harvest, and you will be safer from having the harvest interrupted by swarming than if the queen were confined to 8 frames.

Mating of Queens—Growing Plants for Honey.

1. I have been reading "Langstroth on the Honey-Bee," and I find that it says that the queen mates with the drone while on the wing. I do not find anything any where what the queens mates with in another way. I have six clip queens, and others that seem to be too large to fly, and I would like to know if they will be all right for breeding in the spring.

2. I wish to purchase some honey-plants in the spring, and would like to know what would suit this climate best. What kinds of clovers would you advise, and what kind of garden flowers?

West Virginia.

Answers.—1. It is exceedingly doubtful whether queens mate any other way than on the wing. If the wings of the queen are clip, you should have her on her wedding trip, or if by any means the wings of a virgin queen are bad so she can not fly, you may better kill her at once; she is utterly worthless, as all the eggs she lays will produce only drones. If the clip queens are all right in the new spring, if they were all right in the fall, for a queen does not need to meet the drones each year, but only once for life.

2. Your best chance will probably be among the clovers. Alsike clover is one of the best, and also white clover is somewhat low and wet. Sweet clover will do almost anywhere, and will do well on poor land and on stiff clay. Very likely crimson clover may prove a success with you. It is very beautiful when in flower, and would be an ornament in the yard. Canola is a yellow-flowered and much planted, but it may be worth while for you to try some at that time, as in that case you will be a little ahead if it succeeds.

The Premiums offered this week are well worth working for. Look at them.
Convention Proceedings.

By Dr. A. B. MARON, SEC.

(Continued from page 58.)

Discussion on Shipping Honey Continued.

Mr. Akin—I am glad Mr. Abbott has made his speech; I know a few people in Colorado, Arizona and Utah can people sell their honey.

Mr. Moore—I was going to ask him how he sold 30,000 pounds of honey a year?

Mr. Akin—Don't bother yourself about that, Mr. Moore. In the first place, if we were to have a million people to let the Wisconsin people ship to Chicago, and from Chicago to Denver, and from Denver to Loveland; what would be the freight rate? Not less than first-class, or once and a half, or double first-class.

A Member—Couldn't you ship barrel-staves without all that freight?

Mr. Akin—We would probably have to pay the freight on the barrel-staves, whereas the tin comes to Denver and our cans are put up right in Denver, and distributed throughout the State and adjoining territory, and we have the tin cans. I don't know of anybody in our part of the country who puts up honey in second-hand cans. Last year we put our honey in five-gallon tin cans, otherwise called 60-pound cans. Those cans are made, it is true, out of light tin, and unless they are securely made, you can burst one of them almost as easily as you could roll off a log. When the honey is put into the cans and let it stand for four weeks, and then takes a turn across the continent and back again and it will be there just the same; it will candy solid. At least all the honey I ever produced in Colorado, that has been a good many car-loads, would candy within a month, and will candy as solid as any butter or lard you ever ship. But why put it in a 60-pound can? What trade are we catering to, anyhow? It is come out at different times here in this convention, and in other ways, that the great bulk of the honey we have been producing and taking such pains to get nice, good honey for people to eat, goes where? Into tobacco, into whisky or liquor of some kind or other—I don't know what to call it. I went into a representative from one of the Chicago honey commission firms told us last year that the great bulk of the extracted honey they bought and sold did not go on the table as a table syrup. If that is true, use your old, dirty barrels if you wish to, but in the West where have a good table "syrup" that that there—in the United States, propose to put our honey into cans. It is the cheapest package we can get. Every old alcohol and glucose barrel is pick up by the farmers and others who want to take water on their ground for drinking purposes. The cheapest barrel we could buy would cost us $100, it wouldn't hold anything except water, and not always that. It is true that we could take the barrels and put them out into the open air and let the sun heat them in Iowa out of walnut, and it was put up several years before it went to Colorado. It stood all right until I moved it to Colorado; after I got it in that dry climate, the cracks opened up until you could stick your finger thru. That is what the barrels would do if you ship them from a damp climate and let them stand a little time without rediving the hoops. I tried that once on some barrels I had in Iowa in one hot summer. Afer they had stood in my shop, I filled them with honey and put them out in the sun, let them stand with iron hoops driven tight and putting on iron hoops and drove them until I was afraid I would burst the hoops, and then ship them to Colorado and let them stand in the sun a few days, and then went around and could lift the hoops off from the barrel with a finger. If the honey had not been canned it would have been out on the ground. That cuts but little figure with Wisconsin and New York people, and you who have barrels and can use them and ship them to the packed up, I am producing honey and working on a different line altogether.

Mr. Moore wanted to know how I could sell 30,000 pounds of honey in my local trade. I am making it a staple, and as a staple it must compete with other sweets of equal grade—that means granulated sugar with some honey poured into it to make a syrup. I am not making it for the fancy trade, but when the poor people of this country buy our extracted honey and use it as a syrup, they don't want to buy a barrel of it, and they don't want it to be ex- pensive. That is another thing. Then we sell them five cents, for a package that will hold five cents worth of honey. I am going to hit Mr. York real hard while I am on the floor, and if he undertakes to get after me, I want to set the record between us. Some of our readers read the American Bee Journal an editorial by Mr. York criticizing those of us who want to put our name and address on our package, and he says, "Does the farmer put his name and address on his bags of wheat and on his potatoes, and on his horses and cows?" Yes, sir, a lot of them, pretty much. "Does he put his name and address on them when he sends them to market?" The case isn't applicable at all; his argument is altogether false. The wheat farmer sells it in big bins with 1,000 pounds, and the farmers' warehouses; it is shipped in a car-load to the mill, the miller grinds it, and when it becomes flour, every sack of it goes out with the miller's brand on it, and it remains on it until it is put into the hands of the retailer. Then I buy my honey, if he buys it in barrels or 60-pound cans, and puts it up in little packages to sell to the retail trade, it doesn't make any difference whether I have my address on it or not. The New York store becomes the dealer, and it is in my comb honey that goes thru hands to the retail trade, and is never changed from the moment it leaves my hands until it reaches the retail store, my name has a right and my address has a right, to be on that package and remain there as long as the product remains. A packer or manufacturer is on that goods whenever the goods goes right thru to its destination in the original package; butter is so branded, eggs are not of course, because they are sold in an egg group, but butter is the nature of the product. Yet in the city of Denver, there is a firm, I have been told within the last few days, who are making a specialty of strictly fresh eggs, and when these eggs go out to the different houses around the city, they go out with the name and address of the firm putting them up and guaranteeing them strictly fresh and all right. Now, I will not take any further time on this particular phase of it. But why continue with the large package? Why can't people make the good product and sell it in small packages—put your honey into the small retail package right the first thing; put packages up in dozens, or any other way, just as all kinds of fruit and other things, and put your address and the name of the firm who would like to be used as a table syrup. My honey is put in half-pails 3, 5, and 10 pound sizes, holding 4, 7, and 14 pounds of honey. I put that honey into the pails at the honey-house. I refuse to sell it, except to people right by me, until it has been solid and has been in the pails for enough time to dry. The salesman in my town to-day don't want liquid honey, because they will pick it up and tip it on one side and read the honey-label and then set it down and go off. Every customer who wants to look at it will do the same thing. Directly the honey is cooing around the rim. When it is carded, there is none of that trouble. I am sorry my honey isn't here. I made a shipment by freight but it has not arrived. I believe the price of freight is a little high. We have the printed instructions right here, how to melt that honey, and the people can learn, and will learn, and when they come to the store they want a package that they can take in their hands and put some syrup to go on their table as a staple, and they don't want it to pay for the fancy ways, it is simply to put on their tables. They want it in the cheapest package they can get, and so when it is in a carded condition they take it home and melt it, and everyone is bound to please. Honey is a staple, and not a delicacy, and want it put in cans. I put it up so they can have it either way. If they want it they can take it in the pails and put them in their wagon and go home; it can be used in the town or country, and party the people have a choice. If it is made that way it is simply to put on their tables. They want it in the cheapest package they can get, and so when it is in a carded condition they take it home and melt it, and everyone is bound to please. Honey is a staple, and not a delicacy, and want it put in cans. I put it up so they can have it either way. If they want it they can take it in the pails and put them in their wagon and go home; it can be used in the town or country, and party the people have a choice. If it is made that way it
ing after us to get our honey, and I think we will increase the demand. I have been selling honey very cheap—I won't tell you how cheap; I have been selling it very cheap, and some people said to me, "You are selling honey too cheap; you ought not to do that, Mr. Abbott." Which would you rather I would do? You know if I send my honey to Denver I will have to compete with you? Do you want me to sell at home, or sell in Denver? I say the question comes to this point; if I have a crop of 30,000 pounds for sale, and enough to make the literal crop right around a little village of 2,000 population—making the total crop 50,000, is that community going to consume 50,000 pounds of honey at 10 cents a pound when they can buy granulated sugar for 5½ cents six or 6½ cents a pound and make a splendid table syrup? No, sir, they will not. Mr. Abbott is catering to fancy table trade; Mr. Moore is doing the same thing. Let them put up glass packages, if they want to, for people who can afford it, but let the packy come, and there comes a time when you can't sell to that trade; but the family buys every day in the year; they want it all the time, whether times are good or bad. The family trade is best to depend upon. I said to our Denver people, if I put my honey on the market at 8, 9 and 10 cents a pound, as you want me to, the result will be the people are going to buy the sugar and leave the honey with me; then I have got to ship it. What will I do? Send it down to George Washington, Mr. York. Chicago costs me $30 a barrel; it costs me 97 cents a hundred pounds to get it here, and I pay freight on the package—barrels or whatever it is. Mr. York would probably want to pay six cents there for it, or seven in Chicago; wouldn't it? Chicago has a much cheaper place to the market. How much money have I left for that honey? If I ship to the general market it will net me, less freights, commissions and package, about 3 to 4 cents; and I said to the Denver bee-keeper, Would you rather I would ship my honey and get 4 cents a pound, or sell it at home for 6 cents a pound and keep it at home? I am tending to my own business, I am not bothering you; when you can get more right at home than you can sell, don't put it on the market to compete with other people who haven't the local market, or can't get it. (Applause.)

Continued next week.

By O. L. Abbott.

The members of the California Bee-keepers’ Association met at Selma, Fresno Co., Jan. 7th, and elected a board of directors, consisting of the following members: Dr. J. P. Johnson, J. W. Painie, J. S. Crowder, B. D. Vanderburgh, and C. M. Davis.

The following were elected as officers for the ensuing year: President, Dr. J. P. Johnson; 1st vice-president, J. S. Crowder; 2nd vice-president, C. M. Davis; secretary, Prof. C. S. Taylor, Jr.; corresponding secretary, O. L. Abbott, of Selma; and treasurer, J. W. Painie.

Pres. Johnson read the annual report, showing among other things that the directors had purchased a car-load of cans and a car-load of cases at a saving to its members; that the Association had received and sold 118,732 pounds of extracted honey at 6 cents a pound; and that it had manufactured the wax into foundation for its members at a low cost per pound. The members showed their appreciation by a vote of thanks, and by a request to keep the board.

Grimes was unable to serve as director another year, so Mr. Davis was elected to fill his place.

A committee consisting of J. H. P. Stephens, Prof. C. S. Taylor, Jr., and O. L. Abbott, was appointed to revise the constitution and by-laws, and report at the next meeting.

The meeting adjourned to the first Monday in February.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for $1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

**THE A. I. ROOT CO., Medina, Ohio.**
worst variety will disappear, and the fever is immediately diminishes. The matter attracts much attention. The remedy was accidentally discovered by a young girl who was down with the disease, who secretly refreshed herself with honey and water with the astonishingly curative results, and it was then tried on soldiers sick with the disease.

Bees Seem to be Wintering Well.

There has not been much winter here as yet, but it has turned colder to-night, with prospects of a big snowstorm or ice spell. Bees are wintering well, seemingly.

J. WILEY MOUNTJOY.

Wintering Bees in a Cyclone-Cellar.

I have 49 colonies in winter quarters—30 in my cyclone-cellar, and 19 in a neighbor’s. I put them away about the first of December, and they appear to be doing well. I find the cyclone-cellar the best place to winter bees, as I have lost only two colonies in six years, and they were weak when put away. Last winter I put 10 colonies into the house-cellar, and lost three of them after taking them from the cellar, and the others were weak and didn’t do much all summer.

The bees stored very little spring honey, but the fall flow was good. I got 1,500 pounds in all, over 900 pounds being comb honey. My best colony stored 169 sections, and the next best 168 sections. No. 1 was an old colony, and did not swarm during the summer. No. 2 was a swarm which came off June 18th; but I had 11 colonies that did not give me a pound of honey.

I use the 8-frame and the 10-frame hives.

Maule’s (35 new things for 1901) Seed Catalogue

You should, by all means, have this most modern catalogue of modern times. It is full of new things and useful things. In vegetable, flower and seed, the new things are many. It is full of illustrations. It gives practical, up-to-date cultural directions and offers many cash prizes. The first edition alone sold 20,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which amount they may deduct from their first order. You will make a mistake if you do not write for this the Novely Seed Book of the year. Address, WM. HENRY MAULE, Philadelphia.

Olds’ Big Three tablets

Pat’s Choice—Late—Introduced in 1890. Henry Olds—Late—Most profitable 1891—Warranted to be more successful than any other. H. Olds—Early— Introduced in 1893. Smooth, Handsome, Free from All other using mental—Cyclone—low price. Curing free, stores full boxes. Send and save money. Send for box.

Western Druggists, 30 cents.

We Can’t Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion. Constipation, Biliousness, Sick Headache, Insomnia, “the Blues,” and like complaints——

Laxative NERVO-VITAL Tablets

We know you won’t buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That’s what we do. Send Stamp for “Health” booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make?

At all Druggists—10 and 25 cents.

Handsome Stick Pin FREE!

If, instead of sending for a sample, you send us 25c we will send you “Health” booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by November 30th. An extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

**THE POPULAR BUFFALO ROUTE**

This summer on account of the 1901 Pan-American Exposition will be the Nickel Plate Road. Countless thousands will visit one of the greatest expositions of modern times. The Nickel Plate Road will be the popular line. The excellence of its service is well recognized by the traveling public, and the reputati of its train employees in their uniform courtesy to passengers is well known. When you go East see that your tickets say Nickel Plate. Write, wire, ‘phone or call on John Y. Calahan, General Agent, 11 Adams St., Chicago, Ill. 2, 4A3.
HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Jan. 19.—Honey is selling slowly; this applies to all grades with the exception of white clover and buckwheat, which sells readily at the providing it grades No. 1 or better. We are asking for No. 2 buckwheat honey sold at from 7c to 16c, and candied white clover at from 16c to 22c, travel-stained and off-grades of clover, 13c and 19c. We are offering a good buckwheat honey, 7c; dark and black heat, clover honey, 10c, buckwheat, 8c. Extracted, white honey and clover bringing the outside prices; buckwheat and other varieties are much under.

R. A. BURKET & CO.

KANSAS CITY, Jan. 22.—Fancy white clover, 15c; amber, 12c; dark, 9c; demand good sound. Extracted, 7c; demand cases. Beeswax, 3½c.

W. R. CROMWELL, PRODUCE CO.,

Successors to C. C. Clemmons & Co.

BUFFALO, Jan. 17.—All kinds of honey are so quiet it is difficult to make a sale. Occasionally some customers are by the reason No. 1, 12c; few, 14c; but dark, 10c, and all kinds in liberal supply; some may have to be reconsidered. Extracted honey, white, 7c; clover, 10c. All grades of buckwheat are in Buffalo. Beeswax, 6½c.

PATTERSON & CO.

ALBANY, N. Y., Jan. 18.—Honey market is dull on all grades now, with light stock and light demand. White clover in good condition, ordinary, 15c; fancy, 16c; No. 1, 15c; No. 2, 12½c; mix, 11½c. Extracted, white, 8½c; mix, 6½c; dark, 7½c.

H. K. WRIGHT.

BOSTON, Jan. 18.—Fancy No. 1 white in cartons, 1c; A No. 1, 1c; No. 1, 15c; No. 2, 12½c; 15c; mix, 11¼. Extracted, white, 10c; light amber, 7½c; buckwheat, 7½c. Beeswax firm at 25c.

BLAKE, SCOTT & ING.

CINCINNATI, Jan. 16.—Market very quiet. No change in prices. Fancy white clover sells for 1c. Extracted, fancy, 15c; ordinary, 12½c; Southern grades bring 6½c. Fancy white table honey brings from 6½c to 8c.

NEW YORK, Dec. 22.—Fancy white, 15c; No. 1 white, 14c; No. 2 white 12½c; amber, 12c; buckwheat, 10½c. Extracted in fairly good demand at 7½c for white, and 5c for amber; off grades and Southern in barrels at from 6c to 12c. We have had many inquiries for this honey this year. Extracted, white, 9½c; light amber, 7½c; buckwheat, 7½c.

J. S. M. 

BEEHIVE, Jan. 19.—Market very quiet. No change in prices. Fancy white clover sells for 1c. Extracted, fancy, 15c; ordinary, 12½c; Southern grades bring 6½c. Fancy white table honey brings from 6½c to 8c.

HILDEBRTH & SIEBERN.

DETROIT, Jan. 19.—Fancy white, 15c; No. 1, 13½c; No. 2, 12½c; amber, 12½c. Extracted, white, 7½c; amber and dark, 6½c. Beeswax, 6½c; demand cases. Beeswax 50c.

SAN FRANCISCO, Jan. 9.—White clover 13c; amber, 11½c; 12½c; dark, 8½c. Extracted, white, 7½c; light amber 6½c; amber, 5½c. Beeswax, 6½c.

Stocks of all descriptions are light, and values are being as a rule well maintained at the quoted range. Firmness is naturally most pronounced on light amber and water white honey, the latter being in very scant supply.

HONEY MARKET.—We may have a customer within a short distance of you who wants your honey or beeswax or in close touch with all the markets; therefore write us regarding your variations in market condition for current and future market price. References—Either Bank here for any business man in this City.

Hives, Extractors
OR ANYTHING YOU WANT IN THE
BEE-KEEPING LINE.

WE MAKE ONLY THE BEST.

Our Falcon Sections and New Process Foundation are ahead of everything, and cost no more than other makes. Send for Catalog and copy of THE AMERICAN BEE-KEEPER free. Address,

THE W. T. FALCONER MFG. CO., JAMESTOWN, N. Y.

**SWEET CLOVER**
And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

- **Sweet Clover (white)**: 100 lbs. $1.00, 250 lbs. $2.25, 500 lbs. $4.00
- **Sweet Clover (yellow)**: 100 lbs. $1.50, 250 lbs. $3.00, 500 lbs. $6.00
- **Aislie Clover**: 100 lbs. $1.25, 250 lbs. $3.00, 500 lbs. $5.00
- **White Clover**: 100 lbs. $1.25, 250 lbs. $3.00, 500 lbs. $5.00
- **Alfalfa Clover**: 100 lbs. $1.00, 250 lbs. $2.00, 500 lbs. $4.00

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.
The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

**HOWARD M. MELBEE,** HONEYVILLE, O.

(This Cut is the Full Size of the Knife.)

Your Name on the Knife:—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The Novelty flies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle, is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identity, and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying label gives a false idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for $1.25 or give it as a Premium to the one sending us Twenty New Subscriptions to the Bee Journal [with $3.00]. We will club the Novelty Knife and the Bee Journal for one year, both for $1.50.

Please allow about two weeks for your order to be filled.

**Bee-Hives and Honey-Boxes**
in car lots, wholesale or retail. Now is the time to get prices. We are the people who manufacture strictly first-class goods and sell them at prices that defy competition. Write us today.

**BEES-KEEPER'S SUPPLIES OF ALL KINDS.**

**LANGSTROTH on the HONEY-BEE—Revised**
The classic in Bee-Culture—Price, $1.25, by mail.

Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.
February.

The low-slanting Sun, which for many a day
    Has played childish bo-peep with work,
Is slowly but surely retracing his way,
    Which means he will no longer shirk.

In prodigal mood he deserted the North—
    With harvests a plenty in store—
To riot with beauties of tropical birth,
    And sensuous gardens explore.

Repenting, he turns toward the land where the bloom
    Is waiting his slow, silent tread.
Thrice welcome the wanderer back, and make room
    For music and joy we thought dead!

The bees and the birds have been silent and glum
Since cheery Old Sol traveled South;
The flowers lie asleep till this rover shall come
    And kiss them right square in the mouth.

—BY EUGENE SECOR.
The Best White

Alfalfa or Basswood

Extracted Honey

All in 60-Pound Tin Cans.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

We have a good stock of the fine WHITE ALFALFA and WHITE BASSWOOD EXTRACTED HONEY that we can ship by return freight. Most bee-keepers must have sold all their last year's crop long before now, and will be ready to get more with which to supply their customers. All who have had any acquaintance with the above-named honeys know how good they are. Why not order at once, and keep your trade supplied?

Prices of Either Alfalfa or Basswood Honey:

For the purpose of selling again.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box. This is all.

Absolutely Pure Bees' Honey,

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however local one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

C. C. Miller.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
National Bee-Keeper's Association.

General Manager Secor has sent us the following copy of the report of the committee appointed by the Board of Directors of the National Bee-Keeper's Association to count the ballots cast at the annual election held in December, 1900.

Hon. EUGENE SECOR,

General Manager National Bee-Keeper's Association, Forest City, Iowa.

Dear Sir:—The undersigned committee selected to count the votes cast by the members of the National Bee-Keeper's Association in December, having performed their duties, find the following result:

Total number of votes cast 236.

Elected Manager—Eugene Secor, 236; George W. Yorke, 16; Dr. C. C. Miller, 3; Wm. A. Seherr, 2; balance scattering, 1 each.

For Three Years—W. Z. Hutchinson, 317; A. I. Root, 235; E. Whitcomb, 183; George W. York, 35; G. M. Doolittle, 17; Dr. C. C. Miller, 12; Herman F. Moore, 15; E. T. Abbott, 11; C. P. Dadant, 10; N. E. France, 8; O. O. Poppleton, 6; Frank Renton, 5; C. A. Hatch, 4; W. L. Cogshall, 3; Thomas G. Newman, 3; H. W. Root, 3; F. H. Backstrom, 2; Prof. A. J. Cook, 2; Eugene Secor, 2; balance scattering, 1 each.

Respectfully submitted,

GEORGE W. YORK.

Hon. HERMAN F. MOORE.

The official of the National Association now are as follow:

President—E. K. Root.

Vice-President—John A. Z. Alkin.

Secretary—Dr. A. B. Mason, Toledo, Ohio.

General Manager and Treasurer—Eugene Secor, Forest City, Iowa.

Single vs. Double Tier Cases. Some time ago Gleanings in Bee-Culture published an editorial on the subject of comb-honey shipping-cases, saying that years ago the first were double-tier, holding 40 pounds, and after some time similar cases were made holding just half the amount, and finally 24-pound single-tier cases. The latter were so convenient that naturally the 24-pound single-tier appeared. Bee-keepers and commission men, after using the latter, decided that it was just the thing. The objection to the double-tier cases was that should any of the combs in the upper tier of sections become broken they would leak down over the lower tier, and thus drown them also. During the past few years there has been scarcely a double-tier case used in the East and central West, but in Colorado the beekeepers seem to hold to the double-tier cases with two glasses separated by a strip of wood.

Editor Root says that during all the time the many were advocating single-tier cases Dr. Miller still clung to the 24-pound double-tier case. The Root Company, like many others who handle large quantities of comb honey, advocated the single-tier cases either 12 or 24 pound, but it seems that after getting and disposing of some ear-load of honey from Colorado the past few months, put up in double-tier 24-pound cases, their prejudice against them began to wane; and now Mr. Boydten, their honey-man, and also the freight-handlers, prefer the 24-pound double-tier cases. Mr. Root thinks that while it may not be possible to give fully the reason, it may be an account of the double-tier case being critical in form, and thus more easily lifted and handled than when spread out in a single tier. He says, "Handle a car-load of it and be convinced." He thinks the double-tier case is more symmetrical in appearance, conforming more with other packages holding staple goods.

Mr. Root also says that the double-tier case is now used "with drip paper under the upper set of sections as well as under the lower one, so that the objection to honey leaking from the upper to the lower set has been removed."

Galvanized Iron vs. Tin. A Stry Straw in Gleanings in Bee-Culture says: "Australians seem agreed that galvanized iron does well to hold honey so long as honey without air touches the surface; but let the surface be simply damped with honey so the air can get at it, it is then riddled with holes. This takes place,—[A short time ago the Australians seemed to be agreed that galvanized iron was not fit for either extractors or cans, for holding honey. The verdict in this country seems to be that for extractors it is safe, because the honey is supposed to remain in the machine only long enough to run out. But I believe myself that storage-cans of less than one or two hundred capacity should be made of tin. If larger, galvanized iron will be all right.—Editor."

Queens by Mail. In the American Bee-Keeper Editor Hill refers to the discussion at the Chicago convention in regard to the effect on queens sent by mail. It will be remembered that there were those present who thought that queens were quite a good deal injured in going thru the mails, and also others who did not think they were materially affected. Referring further to the matter, Mr. Hill says this:

To take a queen from active egg-laying and confine her in a small-living-case for several days is such a very abrupt change, resulting in a suspension of her natural function, that even a casual thought of it impresses one with the probability of its detrimental effect. And, indeed, it may be that very prolific queens are sometimes injured in this way. We believe, however, that it will rarely be found that the injury is permanent. Some of the best queens that we have ever owned have come to us the actions of which have been consistent. Some very inferior ones have likewise been received. We might be prone to change this paper to the action of the most inferior lot of queens that we have ever observed and used them only about 50 hours; and then, upon three full frames of brood and bees. There were 50 of them in the lot, and but five or six of them proved to be worth keeping, all of who were of the high-priced kind.

The National Bee-Keeper's Association. We received the following letter recently.

EDITOR AMERICAN BEE JOURNAL:—I have just learned thru the Rural New Yorker the result of the Uter vs. Uter suit against the bees. "Burr for the National Bee-Keeper's Association! Had it not been for that suit would never have been appealed, and then I believe that the suit would have had to be a back seat, and would have surrounded around by anybody and everybody would do this, so I wonder if beekeepers would thrust the country realize the benefit they already have, and will heartily receive from the actions of the Bee-Keepers; that is, it is the foundation upon which we as bee-keepers can build our hopes of having our rights protected.

I am glad my ideas have been stirred up sufficiently to cause me to become a member of the best association we ever had. Enclosed find $1.00 which you will please forward to General Manager Secor.

AARON SNYDER.

We are glad Mr. Snyder wrote us as he did. His letter ought to stir up others to follow his good example.

Really, we don't see how any one that is at all interested in bee-keeping, and in seeing their rights upheld, can fail to appreciate the great value of the National Bee-Keeper's Association. There ought to be a grand stampede on the part of those still outside the Association. They should join by the hundreds, and do so at once.

We are ready at all times to receive the annual dues ($1.00) from any and all, and then forward the money to General Manager Secor, who will promptly mail a receipt to each.

Pasteboard-Candy Queen-Cages. During the past season a number of queen-breeders used mailing cages which had a piece of perforated cardboard at the candy end of the cage, instead of the usual cork that has been used for years. The idea was that the bees would tear away the pasteboard, then eat thru the candy, and thus liberate the queen. It seems that some bee-keepers who received
queens in these cages were not successful in introducing, and attributed the failure to the pasteboard. In a stray straw in Glenings in return Dr. Miller had this to say about it, being having used a number of the pasteboard cages:

The American Bee-keeper, speaking of the pasteboard-candy mode of introduction, says:—

"At this writing numerous reports are coming in which show that failure more often results thru the use of the new plan than with the older method." Isn't your verdict a bit hard on Mr. Hill? In the few hundred cases that have come within my knowledge, there have been rare exceptions when the bees did not make the pasteboard, but that is the only objection. As to the rest, there is undoubtedly additional security from the longer time it takes to remove the pasteboard; and, without being sure of it, my present notion is that fewer failures will occur with the pasteboard.

Editor Root had this comment on the above paragraph:

A good deal depends upon the kind of pasteboard and the manner it is put in over the candy. The first cages we sent out had the strips extra wide. We now cut them a little narrower, so that the candy is exposed on both sides of the bees, as well as thru the pasteboard. It is true there have been failures by this plan of introduction; but the failures have been due, I think, in all cases, to too much pasteboard or to the wrong kind of pasteboard.

Should Brood-Combs be Renewed?

A question sometimes asked, and answers to the question vary according to the place. It seems just a little strange that views on opposite sides of the ocean should be so far apart. Good authorities on the other side say that when brood-combs become old the bees have no use for them any longer, and save space for the growing larvae to such an extent that it is not advisable to allow combs to remain without renewal, the proper time for renewal being given by different authorities at four to ten years. On the other hand, beekeepers in this country pay little or no attention to the matter of renewing combs, and allow them to last as long as they please; some do not rule them out. Some of them say they have combs 10, 20, or more years old, and can see no difference in the size of the bees reared in them. But a slight difference in size might not be easily discerned with the naked eye, and those who advocate renewal of combs argue that as each bee emerges from a cell leaves a deposit in the way of a cocoon, the diameter of a cell must become less, and as a result the bees reared therein must be less.

The only way to settle the matter definitely would be to have instruments sufficiently delicate to measure a very small fraction of an inch, to find by actual measurement the difference in diameter between cells of new and old combs. Such measurements have been made by Editor Root, and unless the specimen of comb measured by him was exceptional, we may thank him for having set the question at rest, and congratulate ourselves that the bees do not show a lack of good judgment when they show their preference for old comb. Mr. Root had sent to him a specimen of worker comb 25 years old, and says:

There are just as many cells to the square inch, of course; but the bottoms of the cells have from eight to ten layers of coccoid, while the sides of the cells have only one, and at most two layers. This would seem to indicate that, when the diameter of the cells gets too small, the bees remove the excess of cocoon walls, but leave the bottoms until they get a packing of ten layers. This reduced depth can, of course, be corrected by adding more wax to the sides of the cells. Now let's see if this is true. There, I've stooped to measure, and find that the thickness of the comb is from one inch to one and one-sixteenth inch. Thickness of new brood comb is about eight-sevenths; and, if so, this 25-year-old comb has been thickened from two to three sixteenths because of the packing of nine and ten layers of coccoid in the bottom of the cells. The other fact seems to be that the diameter of the cells has not been reduced all these years. If this is true with other old combs, then worker-bees in a 25-year-old comb will be just as large as in one six months old. This is inclined to believe correct, because Nature would surely make some provision for the excess of wall-lining.

Weekly Budget

Dr. P. H. Brown of Richmond Co., Ga., writing us Jan. 23rd said:

"Bees did fairly well the past season, and where attention was given they will safely. Thickness of new brood comb is about eight-sevenths: and, if so, this 25-year-old comb has been thickened from two to three sixteenths because of the packing of nine and ten layers of coccoid in the bottom of the cells. The other fact seems to be that the diameter of the cells has not been reduced all these years. If this is true with other old combs, then worker-bees in a 25-year-old comb will be just as large as in one six months old. This is inclined to believe correct, because Nature would surely make some provision for the excess of wall-lining."

Mr. H. D. Cutting of Lenawee Co., Mich., as a good man of our readers knows, has been totally blind for several years. On Jan. 1st Mr. Cutting mailed us a picture of himself and his dog "Duke." This dog is one of Mr. C.'s most intimate friends. He is 2 feet 11 inches high, which is about 5 inches higher than an ordinary dining-room table. He weighs about 150 pounds. Mr. Cutting says, "He is very kind to me, also, a great pet of our family." Mr. Cutting, a man who will remember, had charge of the Michigan apiarian exhibit at the World's Fair here in Chi-

---

Mr. Thomas G. Newman, in his Philosophical Journal for Jan. 19th, had this to say about our New Year's troubles:

Fin.-We regret to learn that the office of the American Bee Journal of Chicago, Ill., as well as the bee-supply and honey departments, were wrecked by fire and water on Jan. 1st. This was a disastrous way of beginning the New Year. As the editor of the Philosophical Journal was editor of the American Bee Journal for nearly 20 years, he deeply regrets this disaster. The present proprietors (Rev. W. York & Co.) have our warmest sympathy and best wishes for surmounting the loss. As they issued the next week's Bee Journal on time, we feel that they are equal to the task.

Mr. F. L. Field was one of our New York subscribers until we received the following letter, Jan. 29th:

Dear Sir:

Now I want you to stop that paper of yours I have had to or three little papers sent me before that I could not stop it when paying up, now I want this to end it. If you send on you will never receive any pay when I subscribe for a paper I'll tell them I am capable of knowing how long I want it with out any of your help.

F. L. FIELD.

The above is as nearly like Mr. Field wrote it as we can show it in type. His subscription was in arrears only since July 1, 1900. If he had been kind enough to have sent us a postal card when it expired, asking us to discontinue sending it, we would have been glad to.

But Mr. Field very likely wanted the Bee Journal, else he would have notified us in a courteous way over six months ago.

Many subscribers express their thanks to us for continuing to forward the Bee Journal to them after the subscription has expired. This is only common sense and until such time as it is more convenient for them to remit. We are always glad to do this, even if occasionally we do receive such a cross-grained letter as Mr. Field wrote us.

We would never think of barring the American Bee Journal on any one, and always stop sending it when asked to do so. We do feel, however, that when a man continues to take it from the post-office and reads it, he ought to be willing to pay for it.

Of course, whenever any one finds he does not want it any longer, then he should pay whatever is due, and courteously request its discontinuance. To do this is only common honesty and ordinary gentlemanliness.
Convention Proceedings.

By Dr. A. B. Mason, Sec.

(Continued from page 75)

Discussion on Selling Honey Continued.

Mr. Moore—Mr. Eaton, the chemist of the Pure-Food Commission, would like to say a word or two about labeling packages, from the standpoint of the Pure-Food Commission.

Mr. Eaton—There is one interesting thing just brought up I forgot to mention, and that is, about the name and address of the manufacturer being on every package; that is the only way honey can be sold in this State, at least in the packages. Mr. Aikin’s name on the label, and address of the manufacturer must be on the package, not only in the case of honey but every sample of food. There is just one other thought that came to me as Mr. France, I believe, was speaking about putting honey in glazed barrels. I think it should be on the label. I don’t believe that is as necessary as it is to avoid the evil itself. It is the adulteration we are looking after. If they get the honey pure, they don’t care so much for appearance. But with the worst adulterated honey comes the finest package.

Mr. York—There are several things I would like to say. I think some one said that the National Biscuit Co. used to label their packages, and to have that in it in packages. If I am not mistaken, they use more honey put up in 60-pound cans than in barrels. The “body-blow” that Mr. Aikin thought he gave me, I did not feel at all. In fact, I think it is good. I have not tried it myself. I think that he was aiming at me. He says he has a right to put his name on every package of his honey. True, he has a perfect right to do so, but if I bought his honey I would take it out mighty quick. Usually the way I put my comb honey for sale is to have these words on the outside of the carton, “Your Honey. Absolutely Pure, Always the Best.” Suppose I sell that to grocers and they take it out of the carton and find R. C. Aikin’s name and address on the section. Wouldn’t the grocers think York is a fraud? I have been the adulterated product, and I have kept a man out at high expense to push “York’s Honey,” and I think I have a right to have my name on that honey and not the bee-keeper’s name. It is none of the public’s business who produced that honey. When I buy Mr. Aikin’s honey, it is my honey, and I have a perfect right to do what I please with it. I can throw it in the Chicago river if I want to, or give it to anybody. It is not necessary for the consumer to know whose bees produced it. There is a great difference between R. C. Aikin’s honey and the honey produced by the bees. Mr. Eaton said the label must be on every package—not the label of the honey-producer, but of the man who puts it on the market.

Mr. Eaton—Either the manufacturer or the packer; some one that we can hold responsible.

Mr. York—So I say that every package that I put out in that shape I have my name on, and I will guarantee it. I am not working in Chicago alone. I boom the business of Mr. Aikin when I pay him his price for his honey. For instance, I know Mr. Moore sells honey in this city and gets a good price for it. If he buys Mr. Aikin’s extracted honey, and puts his name on it, will he get as much for it as he would if he took it in Chicago, the consumer would thus learn that it was R. C. Aikin who produced it, and think that next time he (the consumer) will get his honey direct from Mr. Aikin. Then Mr. Moore might as well go to hod-carrying. He can’t afford to lose a cent. He says that he will gain by paying his expenses to advertise Mr. Aikin’s business. Do you see the point? When I buy a bee-keeper’s honey, that honey belongs to me, and I stand back of every pound of it that I offer for sale. I don’t know that I can say anything more than I have. I have had at least some experience, and believe you all know how I stand on this question. If you had had the experience I have had last winter with honey, I am sure you would not use another honey-barrel while you keep bees. They are dangerous. I lost one finger-mall myself from handling honey in barrels! You will remember the little scene on the platform, yesterday he spoke of a hung coming out—

Dr. Mason—That was a can and the cover blew off!

[Laughter.]

Mr. York—I was going to tell about the 28 barrels of honey that I had standing on end in my warehouse; before I knew it, the honey was leaking all over the floor, and I had to transfer every barrel of that into tin cans.

Mr. Poppleton—The honey we had did the same thing in cans.

Mr. York—I lost scarcely any honey at all in cans. But Mr. Burnett knows more about this subject than all of us put together. He has handled much honey in his 20 years in Chicago, and I would like to have him close this discussion, if he will.

Mr. Burnett—I thought perhaps you had enough yesterday, but this discussion brings to my mind a little incident, I will relate it. If Dr. Mason takes exception to it, you must draw your own conclusions. I was on a tour some time ago. After a little lapse of time in conversation, the lady turning said, “Who is sweet?” The reply was, “Both of us.” Now, this discussion on packages has been sweet; it is all right, and the condition I can take under my tongue. But when one talks about advertising and packages, we see the evil of evil; I don’t believe that is as necessary as it is to avoid the evil itself. It is the adulteration we are looking after. If they get the honey pure, they don’t care so much for appearance. But with the worst adulterated honey comes the finest package.

Mr. York—There are several things I would like to say. I think some one said that the National Biscuit Co. used to label their packages, and to have that in it in packages. If I am not mistaken, they use more honey put up in 60-pound cans than in barrels. The “body-blow” that Mr. Aikin thought he gave me, I did not feel at all. In fact, I think it is good. I have not tried it myself. I think that he was aiming at me. He says he has a right to put his name on every package of his honey. True, he has a perfect right to do so, but if I bought his honey I would take it out mighty quick. Usually the way I put my comb honey for sale is to have these words on the outside of the carton, “Your Honey. Absolutely Pure, Always the Best.” Suppose I sell that to grocers and they take it out of the carton and find R. C. Aikin’s name and address on the section. Wouldn’t the grocers think York is a fraud? I have been the adulterated product, and I have kept a man out at high expense to push “York’s Honey,” and I think I have a right to have my name on that honey and not the bee-keeper’s name. It is none of the public’s business who produced that honey. When I buy Mr. Aikin’s honey, it is my honey, and I have a perfect right to do what I please with it. I can throw it in the Chicago river if I want to, or give it to anybody. It is not necessary for the consumer to know whose bees produced it. There is a great difference between R. C. Aikin’s honey and the honey produced by the bees. Mr. Eaton said the label must be on every package—not the label of the honey-producer, but of the man who puts it on the market.

Mr. Eaton—Either the manufacturer or the packer; some one that we can hold responsible.

Mr. York—So I say that every package that I put out in that shape I have my name on, and I will guarantee it. I am not working in Chicago alone. I boom the business of Mr. Aikin when I pay him his price for his honey. For instance, I know Mr. Moore sells honey in this city and gets a good price for it. If he buys Mr. Aikin’s extracted honey, and puts his name on it, will he get as much for it as he would if he took it in Chicago, the consumer would thus learn that it was R. C. Aikin who produced it, and think that next time he (the consumer) will get his honey direct from Mr. Aikin. Then Mr. Moore might as well go to hod-carrying. He can’t afford to lose a cent. He says that he will gain by paying his expenses to advertise Mr. Aikin’s business. Do you see the point? When I buy a bee-keeper’s honey, that honey belongs to me, and I stand back of every pound of it that I offer for sale. I don’t know that I can say anything more than I have. I have had at least some experience, and believe you all know how I stand on this question. If you had had the experience I have had last winter with honey, I am sure you would not
everybody who will refuse to buy a second-hand can, no matter who offers it to them for sale, nor how good it is or appears to be. The package for honey ought to be tested, and the party who uses the package ought to know what conditions are necessary to keep honey in good shape. A man like Mr. France, he won't make a mistake with a barrel; he works out that thing. He knows now what is necessary to carry the honey in the right kind of condition. He has been in the trade forty years. If there happened to be any harm done in some years ago a bee-keeper came to this city and sold his honey to the retail trade. A good many have tried it in the past, but they have not all stayed with us; but this one came, and he sold all his honey, and sold all his neighbors' honey, and began to be a haring of business. Well, he felt enthusiastic about the matter; he felt sure that he had gotten into a business now that he was going to get rich at. He didn't think anybody could do much better than he was likely to do, and he did the first year. The second year he didn't bother much with his own product, but he bought from me several tons of honey and stored it, and it was mostly baswood honey in barrels. The first year he didn't sell nearly as much honey as he did the first, and the third year he didn't sell a great deal of honey, so little, indeed, that he concluded he would not sell out the business. The same in the audience could probably tell someone about the same. That was his experience. I bought some of that honey. It had been stored in the basement, I think, three years, and there didn't seem to be anything the matter with the honey: some hoops had come off from some of the barrels in that lot—not only so, I suppose, but they had all been dipped. I don't know how much they had been dipped, but they had been dipped, and I gave them away. I have sold them to other parties and the honey seemed to be all right. Barrels are dangerous unless the man who uses the honey knows just how to do it, and knows how to make a barrel to hold honey. A tin can that will hold a liquid and be well soldered, will do for honey on almost any occasion, although a great many people who have made cans for honey solder the joints so light that the honey will be lost in the soldering. Some people have sprung them, and lots and lots of honey has been lost in that way. I have had them come in car-loads where the cases were thrown and smeared in honey 3 inches deep on the floor of the car, and I had to make and sell them. I think that raising honey is an almost inexhaustible subject, for strong-minded people who have had lots of experience know what they need in their business in the way of a package, and as for selling it, we need small packages and we need larger ones. If they are all small, they will not bring any more than half a barrel and half a small can; that is probably the experience of the trade.

Mr. Mason—Now, you see, the people who have spoken in this discussion might have summed the whole thing up by saying, Put your honey in the package that your market demands. It doesn't depend upon the barrel; it depends upon the man who handles the barrel; doesn't depend upon much more than how the man who handles the can. Don't try to sue Mr. Abbott by sending honey to him in cans, if you have a market that wants barrels. Mr. Poppleton—Mr. Barnett, how much more can you sell honey for in the Chicago market in cans than in barrels?

Mr. Barnett—I don't know as I can answer that question unless it is in this way. If it was about half in cans and half in barrels it might sell at about the same price.

Mr. Poppleton—Mr. Abbott said that we shippers should have a little compassion on the shippers and pay them back the extra money cans will cost us, and they will get all the cans they want. It costs me 75 cents more per hundred pounds than it does in cans and barrels. The whole question with me is that and that alone.

Dr. Mason—Mr. York spoke of the National Biscuit Company having so many cans to sell; we have a National Biscuit Company here, and I can, "Why do you have so many cans to sell?" and they answered, "Because we can't get honey in barrels and are obliged to buy in cans." Mr. Poppleton—I have taken great pains to find out what the man was getting behind my back and tell them I have barrels.

Pres. Root—Mr. Akin wishes to make an explanation of the labels on packages.

Mr. Akin—The explanation I wish to make about labels on packages is this: Mr. York, or any other dealer, need not worry about losing his trade because my name and address is on the package. It is only the man who buys or ships in car-loads who is able to pay freight, and a man in this city who wants to buy a case of honey, either comb or extracted, isn't going to send to me and pay local freight. No, he is going to buy my honey from Mr. York, I wish to speak on that point because there is an undue fear in that respect.

Mr. York—Many private families in Chicago who could easily afford to send to Colorado for Mr. Akin's honey, and pay for it and also pay the freight on one 60-pound can or 50 pounds of comb, rather than pay the retail price that grocers have to charge here for honey. Well, with the dealer knowing that the consumer is entirely right, still no city retail dealer is quite foolish enough to furnish his customers with information as to his source of supply so they can buy direct. It costs too much to work up a demand or line of customers, to turn it over to some one else in that way afterward. I would not expect that the bee-keeper who buys honey of me to retail among his customers would use my name and address. It is a little out of the line for him to tell the customers just where they can get that same kind of honey. That wouldn't be ordinary common-sense let alone business sense.

Continued next week.)

BY JAS. A. STONE.

The Illinois State Bee-Keepers Association held its eleventh annual meeting at Springfield, Nov. 20 and 21, 1900. On account of bad Illinois mud roads there were but few present except those who came by rail. Nevertheless we had a good and profitable meeting. Among those present were Mr. I. N. Shadow, president; Mr. Willard, secretary; Mr. W. S. Reid, vice-president; and Mr. A. K. Becker, treasurer.

There was a large attendance of members in the city and suburbs, and a great many who were hotel guests. Messrs. George W. York and C. P. Dadant, and, as Mr. York has said already in the American Bee Journal we heard with great interest of a few of the many things he (Mr. Dadant) learned while on his trip thru France, and other parts of Europe.

The treasurer not being present at the opening of the meeting his report was given along with the secretary's, and showed that on account of furnishing the Bee Journal to the member in Illinois for the past year, that Mr. I. N. Shadow, president of the Convention, to Jas. A. Stone, Sec., Rural Route 4, Springfield, Ill.

The president's address was brief, but in happy, well-chosen words.

Mr. Becker said, "I am a Methodist, and favor experience meetings, so let us hear from all the members. My bees swarmed a great deal, and stored no honey. Mr. Dadant, how would you prepare a winter cellar for bees?"

Mr. Dadant—The beehive in the cellar is the warmest part of the furnace-room by a double-4 inch wall, pack between with sawdust, ceiled overhead, and there pack the same. There are two windows outside, arranged with shutters to let in air but not light.

Mr. Titterington—Do you let your bees swarm, or do you divide them?

Mr. Dadant—Almost entirely the latter.

Pres. Smith—I present continued swarming by first honey. Mr. Akin's is a second swarm, and I may say at the end of 48 hours empty them in the evening at the entrance of the mother (old) hive, which will likely end swarming for that colony for the season.

Mr. Dadant—Whom did you get that from?

Pres. Smith—From you.

The premium list committee reported, and on motion a temporary committee was named as follows: Chas. Becker, C. P. Dadant, and Jas. A. Stone.

The premium list committee is instructed to ask for a larger premium on honey extracted on the grounds, on account of its being an educator to those who were prejudiced against extracted honey.

Mr. Dadant said in his splendid talk on his travels thru Europe, that he could distinguish the American honey at the Paris Exposition from that of the other countries, by the neatness of the sections, even at a distance; and in the apiaries that he visited he did not see the improved implements that were to be found in this country. He began to think he was more of an American than Frenchman. But he also said in their favor that their bee-keepers' meetings
were more largely attended than ours, and they did not al-
low the only ones things till be had paid his fee, of one or two dollars, as the case might be, and had still
had a membership of 200 or 300.
Mr. Becker—One year, when the white clover honey-
flowers was gone, I cut some colony that gathered 16½ pounds of honey in one day, and the same colony in the fall gath-
ered 14 pounds from heartseed.
A paper by George W. York was read as follows:

PURE FOOD LEGISLATION.

This is a large subject. It means much at both ends. First, it will take hard work to secure it; and, second, it will take much more and harder work to enforce it after it is secured.

Illinois succeeded in the passage of what was, thought to be a good pure-food law at the last session of its legisla-
ture. Some attempt has been made to enforce it in Chi-
icago, but so far we believe without much effect.

As to the question of the need of pure-food legislation, only the adulterator or swindler would object. The very health and life of the people depend upon their getting pure food. There is also a moral aspect to the case. The sale of impure food is a deception and a fraud practiced upon the purchaser or consumer. It is getting money under false pretenses, and the result of the trade by its worst and most dan-
gerous kind. The state should protect the lives of those who help make up the State; especially should it step in and insist that helpless women and children shall be prevented from being imposed upon and defrauded by those whose conduct is a danger to the community.

I think that if the law contemplated the prosecution and punishment of the manufacturer or wholesaler of the goods instead of the retailer, better results would be ob-
tained. This would of course necessitate the labeling of prac-
tically all goods offered in the open market. But this could be done, and the retailer could be required to reveal the source of his supply, if found adulterated.

The demand for pure-food legislation is one of the most important requirement to the successful results of pure-food legislation to honest officials—officers who know no better than to enforce laws just as they find them, without fear or favor. No law ever enforced itself, and never will. The reason, almost invariably, why prohibi-
tion laws don't prohibit is because of officials who are cap-
date honestly and fearlessly. I believe, however, that the
present pure-food commission of Illinois are all right, but that the fatal weakness is in the law itself.

But so long as the "dear people" persist in electing as their State lawmakers, saloon-keepers, poultereightful politicians, gamblers and frauds, just so long may they expect to have weak laws—that laws that fail at the most crucial time, because they are weak and not with that intention. The people must act honestly and demand that in the selection of their lawmakers and public officers, then, and not until then, need they expect that good laws will be furnish and properly enforced.

It would be one of the simplest things in the world to drive practically all the adulterated honey out of the Chi-
icago market, or any other market, for that matter, if it were not gone about in genuine earnestness and with determina-
tion to accomplish this thing. The York and Division of the law permitting the confiscation of all the adul-
terated food on the market. A few raids back up with a law having such “teeth” in it would soon end the adul-
terating business. There wouldn’t be any profit in it; and any business that is uneconomic in dollars and cents will soon be left to take care of itself, and that means speedy death.

The people should unite in demanding the enactment of strong adulteration laws. If they do not comply with such demand, then proceed to elect men that will give heed to the people’s will. Having secured suit-
able laws, elect only such men to office as will understand that their retentive power depends upon their executing the will of the people as exprest in the law. Pretty sud-
denly after such things have come to pass there won’t be much adulterated stuff to be found. Even frauds don’t en-
joy frequent and close contact with so good a thing as a good strong law—one with cross-cut law tactics, and not coming and going.

GEORGE W. YORK

The election of officers for 1901 resulted as follows:
President, J. Q. Smith, of Lincoln; 1st vice-president, George Polidner; 2d vice-president, C. P. Ddim; 3d vice-president, S. N. Black; 4th vice-president, J. M. Titter-
ington; 5th vice-president, A. Stone, R.D. & R., Springfield; and treasurer, Chas. Becker.

On motion the temporary premium list committee was made permanent.
The convention then adjourned sine die.

The Afterthought.

"The Old Reliable" seen thru New and Unreliable Glasses.

By E. E. HASTY, Richards, Ohio.

BEES GNAWING COMF FOUNDATION.

It is a vexatious thing to have bees gnaw foundation after it is put in—half inch of foundation, then a big hole, then the lower half of the foundation pretty much all right, except with nothing to hold it in place. Presumably Mr. Doolittle is right, that flat-bottomed foundation is gnawed much the worse: and that is a serious short-com-
ing. Still, it may be rather the thinness than the shape that tempts them. When they are fixing the bottoms they don’t tear things down, and when they tear down they are not fixing the bottoms—not even that can suit them or not. I don’t think bees ever nibble up founda-
tion at the same time when it is being prepared to put honey in, or that they ever throw the fragments away, as might expect. Incapable of entertaining more than one idea at a time, and also being the opp. to mix up with propolis and dant things with. My bees won’t even spare the half inch at the top when only start-
ers are put in.

And prepare your queenless hive to keep your drones, while you have plenty. For if Doolittle can’t practically make bees rear more in the fall it isn’t likely that you can. Hand-picking of drones I am rather suspicious of. May be it’s all right. Almost certainly it’s no harm. One can’t get in the idea that drones (or rather drones) can harm heritances (prospective) which drones carry about them inevitably must be totally invisible—or mostly so. Page 7.

THE GREED OF GREAT CORPORATIONS.

I think we have been shown few examples of the com-
tempt with which great corporations regard what common citizens think, and must think, of their ways, to exceed the one given on page 9. Freight to San Francisco charged when the goods never went there, and were never intended to go there, and then freight back again added. This regu-
lar add-insult-to-injury kind of clean steal. I’m not sure we are going to have overcharges corrected right away, for when there is a desire to overcharge, some less flamboy-
ant we do it than that can easily be found; but I’ll venture to prophesy that the twentieth century will not be very many years old before corporations decide that it pays to keep their outrages a little out of sight of the people when they can just as well as not. Presumably the evil habit comes of gradual up in the hexagon, not even as good as the bee being actually sent that way—nobody on the thru trains knowing what the lock cars contained in the line of small items.

CHUNK HONEY IN PAILS.

That chunk honey on page 19 was too big a lot, and had "got too far from Canada." People used to sections are not likely to evolve backword and buy the old-fogy style. But in back-country towns, where folks have never bought sections, and don’t want to begin, there small lots in bulk would be all right. I doubt if it’s best to, solder it up in tin, however. Empty candy-pail, or something in the line of a big pail with close-fitting cover, would look to me more like the thing, even if it had to go 50 miles by wagon. In-
deed, while modern glasses the half of a pound of honey might easily pay for lots of wagoning.

HEXAGONAL APIARY A BACK NUMBER.

Weep over Mr. Doolittle giving the weight of his-name and example to the hexagonal style of placing hives. Out of date for one thing, and another, and not must to recommend it in the first place, but the fantastic resem-
blance of the hexagon to the honey-comb. The fact that we are bee-keepers does not make us long to be paid for our crop in hexagual in the Hexagon, not even as good as the rank-and-file, and the latter barely escapes being a dis-
Questions and Answers.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.]

Feeding Bees in Winter.

I have a lot of bees that will need feeding. I read of bee-candy. Where can I get it? and how is it fed to the bees? I have old-fashioned hives without sections. Would it do to put the candy underneath, or how will it be best to use it?

SUBSCRIBER.

Answer. — It may be you can get bee-candy from dealers in supplies, but keep-candy generally makes it for himself, and you will find instructions for making in your text-book. [See page 59 for directions for making the "Good" candy.—Editor.]

From what you say, your hives are probably box-hives, and there is no chance to feed them above. If the weather is such in your locality that bees are flying every few days, it will be all right to put the candy underneath. Crowd it close up to the combs, so the bees can crawl directly from the combs upon the candy. Put the candy there in the evening, and contract the entrance for a few days, so the robbers will not trouble. If you are in a cold locality, where bees may not be flying for some time, take your bees in the cellar (if they are not there already), turn the beehive upside down, and lay the candy on the combs.

How Many Bees Die During Winter? — Wintering in a Warm Room.

1. How many bees in a good colony will die during the winter months, or before the flowers come in the spring?

2. I have two colonies in a room upstairs, which is heated from the kitchen stove. The bees were placed there because their storehouse of honey was not sufficient to carry them thru. Should they be kept in darkness, or have the light? I have a glass box over them, so they can fly around a little, and also carry out the dead bees. Some think they will not winter in this way, but they seem to be doing well, and are quite ambitious.

NEW YORK.

Answers. — 1. It is a hard thing to give a definite answer. One colony may lose ten times as many as another, the two sitting side by side. A given colony may lose ten times as many bees under unfavorable conditions as it would under favorable conditions. One colony may be composed mainly of old bees whose "span of life is nearly run." another may have a large number of young bees. So you see it's a hard matter to say how many will die, and it's no great wonder that the books don't try to tell us. About as near a definite answer as they could come would be to say, "A whole lot." If I were forced to give some kind of an answer, I think I should say at a guess that you ought not to complain much if not more than half of them died, and feel exceedingly thankful if only a fourth of the colony died.

2. Look here, my good friend, if that colony comes out alive in the spring, you can be put in a glass case in a museum and exhibited as the man that brought the winter alive a colony of bees in a room well warmed and lighted, the bees having the opportunity to fly within a limited space when they had a disposition to do so. It is true that some cases have been reported in which bees have been successfully wintered in a warm room above ground, but as a rule it is considered that in such a room kept dark through the winter, a colony of bees will be found dead in the spring, and if the room is light they will be deader yet. It might be well for you to keep the room, give the bees some honey or candy, and in two or three days later return them to the cellar.

Wintering Troubles.

I wish you would tell me what to do with my bees. For awhile the temperature was at 42 degrees, and one of my colonies started to rear young drones and consumed their honey. They had a young queen which I could not get to lay last fall. I fed them for a week, and it didn't go any good, so I thought I would unite them in the spring, but as they used up most of their honey I just took the cover off and the bottom-board of another that had plenty of honey, and gave them a little tobacco-smoke, but this did not go. There was about two quarts of dead bees in a few days. I don't know whether the smoke killed them, or whether they killed each other. Then, the temperature went down to 35 degrees, and my bees were all quiet. But now it is down to 30 degrees, and they are making a little noise.

IOWA.

Answer.—Probably about all is done that can be done. The colony that began rearing drones was most likely queenless, or had a bad queen, being worthless in either case, and was killed by the bees that had a good queen. The bad colony is now dead, for which you need not greatly mourn, and the other colony may be little the worse for the scrimmage.

Feed-Bags and Burlap for Packing.

How will old feed-bags or burlap do for packing outside cases, 5 or 6 inches larger than the hives? I have only 3 colonies this winter packet with burlap and with hay-chaff in outside cases, and a super under the hive forms below.

MAINE.

Answer. — They will make good packing, but look out that the mice don't find it too comfortable a place for their needs.

Bees Troubled with Moth-Worms.

What can I do to stop millers from getting into the hives and destroying the whole colony? I have had five colonies to share the same fate. They seem like the common white millers that are about an inch long. They are pack in like sardines in a box. Father had bees for 50 years, but never had anything like this. As he is not here to teach me about bees, I will have to depend upon the books. — NEW JERSEY.

Answer. — When worms spin their cocoons in a hive and are packed like sardines in a box, the case is pretty bad. The first thing, however, that it is important for you to get into your head, is that the worms are rather a result than a cause of the trouble. In a strong colony of bees, the worms never get much of a foothold, for the bees will keep them cleaned out without any attention on your part. A weak colony of black bees may allow the worms to get in, but if the bees are Italian even a weak colony will keep the worms at bay. You may, in some cases, get some help by lifting out the combs and picking out the worms, and replacing them in the box. Aside from this about all you have to do is to see that no colony becomes queenless or weak, and to try to have as much Italian blood in your bees as possible.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is attractively paid for, 75 cents; or we can send the American Bee Journal one year and the picture—both for $1.00. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

The Premiums offered this week are well worth working for. Look at them.

Three Foggy Notions of Value.

Wide-Frame Supers, the Honey-Board, and the Telescope Hive-Cover.

By Friedemann Greiner.

What wonderful improvements have been made during the past 50 years in bee-hive manufacture! Even 30 years ago it was an uncommon sight to see anything else but box-hives in a bee-yard. If we will except an odd case of a single-frame hive, the manufacture of the hives were the order of the day. A market change has taken place—a change for the better. Well-made and nicely painted movable-comb hives have taken the place of the ugly boxes. It would seem almost as tho the climax in the line of hive-manufacture had been reach; but still the improvement is going on. As to the construction of the brood-chambers little is left that need be changed. Of the different patterns, one should please the most exacting.

As to a cover for my hives, I can not become reconciled to use the modern light single-board or even the improved ventilated covers. A single thickness of lamber between the inside fixtures and the honeycomb is not enough, and if a single-board is required to make it safe—and it is—a better cover could be built, not costing more. Accidentally I once left the telescope-cover off from a hive during the noon hours, leaving the surplus-case protected only by a 1/4-inch board. Two hours later, when I happened along again, the honey was running out of the entrance of that hive, and a case of honey was ruined. A shade board would have prevented that loss. A regular telescope-cover, such as Father Langstroth used on his 10-frame single-frame hive, would have been still better. I have not yet found anything to suit me better. I think it is an advantage to have the cover made tall enough at least to take in one super. If made to take in two supers the cover becomes too heavy and expensive. It would of course be a good thing to have the two supers well-protected against loss of heat as well as against extreme heat; but if we do not have better honey seasons than we have had for two or three years, the single-frame cover will suit.

The honey-board is the next foggy notion. Father Langstroth made use of it; and in this way it was handed down to me. When I saw so many adopt and use the quilt instead, I also gave it a trial. For two years I used it extensively, but it did not please me as the board, and I discarded it for summer use. The bees have a non-com- mendable way of chinking in propolis between the quilt and the tops of frames or sections; and every time the quilt is raised more gla is crowded in, for the quilt cannot well be readjusted as it had been before. More propolis and stain is found on quilt-covered sections than on those entirely exposed. I would rather use the board, even on such supers as have sections unprotected at the tops.

A honey-board is also very convenient as a record-keeper. On many of my hives the record for 10 years may be found on the honey-boards.

A marvelous success—I would rather say change—has taken place in the supers, and most complicated arrangements have made their appearance. Quite a number of years ago, soon after Mr. Root invented his double-tier wide-frame, my brother and self hit on the same device un- known to any one else, and we were both working in use, except that we adopted a single-tier wide-frame and wooden separators. I have since, and before, used other styles of supers quite extensively, but I have not been able to find one that meets all my requirements and is as handy as this one. To be sure, I have changed the size of my sections several times, but still the wide frame is my favorite.

The objection is sometimes raised that it is difficult to remove the filled sections from the frames. Those who have never given the wide frame a trial are excusable for holding such an opinion. A friend from a neighboring town stopped with me this fall and looked over things; he ex- pressed just such fear. He was not in the business very ex- tensively, but said he wanted to go in, and before doing

so he wanted to find out what the best supers and appliances were, so not to be obliged to change later on when it would cost more to change. "If we all had been as careful as this friend, how many mistakes would have been avoided, how much money we could have saved!"

Well, it so happened that I did have a few full cases of honey on hand that had not been disturbed, but were ex- actly the same as the ones they came into the hive with, and in a few moments the doubts and fears of my young friend were dispater, for the filled sections came out easier than empty ones would. In fact, there is no difficulty whatever.

And then the advantage of having our sections pro- tected on all sides is not—well—to be sneered at. The popular section-holders, the T and other supers, leave just that part of the sections exposed that above all, should be protected. I always have my honey in my hive. I would not have it in the hive; thus the tops of the sections are first ex- posed to view when a case is opened, and, when they are soiled, they make a bad impression. I can understand that those who use such supers and have not a cruiser, will not know what kind of hives we in America use, not one in a thousand can be induced to try them. We Americans can hardly understand this attitude of the Germans; and yet, even in America, it takes a long time, sometimes, be- fore a good thing is recognized. Sometimes even a good thing is thrown aside, as is the case with the wide-frame super, the honey-board, and the telescope cover.

An Interesting Cellar-Wintering Experience.

By E. S. Roe.

I KEEP my bees in the cellar, and have a lamp-stove to regulate the temperature during extreme cold spells. The cellar has no other deposit than the bees. The lower hives are about two feet above the floor, but otherwise so compact that only narrow aisles are left between the bees.

Yesterday (Dec. 31) the thermometer registered, outside, 28 degrees below zero; in the cellar the temperature was 2 degrees below freezing. So in the evening the lamp-stove was placed on the floor, and I went to bed and left the stove there, before, with a metal cover over the top for shading. The light coming from under the burner seemed to annoy the bees more this time than before, so a cheese-mould (zinc open at both ends) was placed over it. Every time the fire was adjusted, I covered the stove with a cover of zinc. The bees, being close at hand was placed around the lamp. The free draft at the top and the small holes in the sides I thought would give plenty of oxygen.

After watching the smoke for a little while, with an air of satisfaction, I turned off the lamp, replenished the fire in the heater, and prepared for the pleasures of dreamland.

I will never be able to tell how much I dreamed, but at any rate just as the Third Year and Old Century were leav- ing, the bees and I were undergoing a very unpleasant siege of lamp-black smoke. The strong scent awakened me, and on lighting a match I noticed it was just a little past midnight. The New Year's celebration, indeed, was being held in the house full of smoke—"a bad beginning"—but there was comfort in the last part of the saying—"a good ending."

The stovepipe was examined, and then the stove. The tray holding the lamp-stove was next, and the trouble found. The lamp-stove was all aglow. Flames were shooting from under the burner. A little red "vase" stood dan- ning from the perforations of the screw cap of the lamp, and a column of smoke was rapidly moving from the top. The blaze was soon put out, and with a cloth I was able to hold the hot and sputtering thing long enough to remove it.

The bees were surprisingly on their best behavior. Only one or two were heard flying. The hive, entrances
and covers of the top hives were covered with flakes of lamp-black. They had been carried up by the heat and then settled on the hives like falling snow. Of course, the use I made of the cheese-mould was the cause of the trouble. The heat being more confined caused the light to burn higher, which in turn generated the heat, greasing the flame on the increase, in this way acting on a principle of law that was rapidly carrying it to a serious condition—possibly to the end of explosion, loss of bees and loss of honey.

Each reader will be left to form the moral that will be of some practical good. I am thankful that smoke accompanied the excessive heat and came to notify me of the danger.

To-day the bees are quiet, and I hope they are as they seem—no worse for the experience.

TODD CO., MINN., JAN. 1.

Contamination of Queens Thru Hybrid Bees and Royal Jelly.

I HAVE two colonies of hybrid bees in an isolated position, with which I wish to try an experiment. I wish to breed Italian queens from Italian larvae by the plan given in your book. Now, if I supply the cell-cups with royal jelly from a hybrid colony, place larvae in them from a pure Italian queen, and place these prepared cups in a hybrid hive, the question will be whether something emerging therefrom be pure Italian? Be kind enough to reply to this question thru the American Bee Journal, as I am a regular subscriber to that excellent paper."

Thus writes a correspondent.

In answering the question, I will say that I take it that the questioner is in doubt about the part played thru the bees which prepare the food for the queen-larvae. He has evidently heard, thru some one having "locks hoary with age," something of the fact that the bee-keeping fraternity during the sixties, of "like food, like queens." As hybrid bees are used, quite likely, they giving the best results in queens of any variety of bees with which I am acquainted, except the Cyprians, I have and do use them very largely to feed and perfect queen-cells, and, after years of careful watching, and with years of success in perfecting Italian bees, said to be as good as can be found in the world, I fail to find wherein the food has anything to do with it, or the changing of the color, or the disposition of the progeny of any queen, in the least.

If royal jelly prepared by black or hybrid bees could convert the Queens thru the hybrid bees, surely the food prepared by Italians which were of such an orange color that they seemed like lumps of gold when flying in the sunshine, would contaminate the black or German race of Italian queens. I have no doubt a doubt in my own mind, by several experiments, that black queens brought to perfection thru the royal jelly prepared, and the nursing given, by the yellowest of the golden Italian bees, are not in the least degree different from those nursed by their own "blood." Hence I feel that I am justified in going on ord as saying that the queen progeny of any race or variety of bees are in no way changed as to markings, disposition, etc., thru the food given them. If there are those among the readers of the American Bee Journal who, after reading this, otherwise, I should like to have them tell us upon what they base their conclusions. While these nice points are of interest only to queen-breeders, in a dollar-and-cents way, yet they are making up the general fund of bee-knowledge which we are handing over to future generations; hence I believe the American Bee Journal will be willing to give all of the best thoughts on the matter which are sent in.

But before closing I wish to say a few words about that purity part which our correspondent seems to cling to, as being the ne plus ultra in the Italian race. I have objected for years, and do still object, to the calling of our Italian bees "queens pure,- for, from everything I can gather, they are nothing but what would be perfectly pure queens of a variety of bees. This is also proven by the fact that we have all shades and colors of these bees, from those having golden abdomens nearly their whole length (as shown in the workers), to those which are so nearly black that it takes an expert to tell whether they have any Italian blood about them, only as it is known that they were imported from Italy—the very same place from which came the progenitors of the most beautiful orange-yellow bees obtainable in this country. Had the Italian bees been pure, in a sense equal to that of the pure black or German bee, no such change of color could possibly have come about by years of breeding for color. But this non-purity part of the Italian bees is in no way detrimental, for the smallest bee at the head of all the bees, as to its industry and usefulness to mankind.

* These prices are not the publishers’ prices for these papers, but they are our special reduced prices when taken in connection with Gleanings. In many cases they are just one-half the regular rate.

How to Get the Price for any or all of the Papers Named Above.

1. Gleanings in Bee-Culture, one year, $1.00.
2. If you want only one additional paper, add the price found in the top of the column in which that paper appears. For instance: Gleanings, and Success (2d col.) will cost you $1.50.
3. If you want several papers in addition to Gleanings, each one may be had at the price named at the top of the column. For instance: Gleanings, Success (2d col.) and Rural New Yorker (3d col.) will cost you $2.25.
4. You may select as many papers from each column as you wish.
5. Every order sent must include Gleanings.

CONDITIONS.—Offers subject to withdrawal without notice. Subscriptions to the Review of Reviews, Youth's Companion, and Country Gentleman must be strictly new. Neither the Review of Reviews nor Post Fountain Pen will be sent in any combination amounting to less than $2.50.

THE A. I. ROOT CO., Medina, Ohio.

A Very Successful Season.

Last season was a very successful one with me. I began the season with 20 colonies, secured over a ton of honey, mostly comb, and put 25 colonies into the cellar Nov. 14th, in fine condition. I was sorry that you suffered such a loss by water thru the fire, but I hope you will not be discouraged for we need the Bee Journal as much as ever. Success to you and it.

FRANCIS HALL.

Bees Did Well—Prospects Fine.

My bees did very well the past season. We have had considerable rain almost the whole time for good crop the coming season.

I was sorry to hear of your loss on account of the fire in your building.

B. P. SHIRK.

Short Honey-Flow— Bee-Papers.

The honey-flow here lasted only two weeks the past season. I secured about 2500 good, salable sections, but some of the bee-keepers around here who do not take a bee-paper got very little honey and some got none.

I have tried to get them to subscribe for some good bee-paper, but they either know too much, or think they can't afford it. My experience is that I can't afford to do without them.

EDWARD WILSON.

Management at Swarming Time—Is it the Effect of Eating Honey?

On page 808 (1900) Dr. Miller says in answer to question No. 1, in regard to management at swarming time: "The caged queen was put in at the entrance. Suppose the cage would not go in at the entrance, could it not be put between or over the frames, or in a corner of a frame where there is drone-comb, by cutting enough out for the cage? Also, the Doctor does not say how he confines the queen—whether the bees are allowed to enter the cage, or if they feed the queen thru the screen. Novices, like myself, perhaps would not understand it. Is there no danger of the bees killing the queen when she is releas'd?"

I am also interested in the question

Experience With a Clipped Queen.

I would like to tell of an experience I had with a swarm of bees that had a clipped queen. They came out, flew around awhile, then went back and

clustered on the front of the hive up under the shade-boards, staying there eight days. Soon another swarm came out with a young queen and clustered, and I hired them. Two days after this the old queen came out with a swarm, and the swarm on the front of the hive rushed after the bees had not moved when the other swarm came out. I moved the old hive from the stand, put a new one in its place, with the caged queen on the alighting-

boards. The swarm rushed after the queen, encircling the hive with the old queen. Why did the old queen come off with the last swarm?

Edward Knoll

Ontario, Canada, Jan. 25.

Not a Good Season—Yellow Wax.

The past season was not a very good one for bees in this locality. Last winter and spring were very hard on them, and I lost over half of mine, and did not have a swarm during the season. The bees stored very little surplus honey during the forepart of the season, but thru August and a part of September they did pretty well. I secured nearly all my surplus of surplus honey, and I got 10 colonies into winter quarters, one of which I am keeping on shares. This colony is from a hive of bees that had been the farm of the owner over 20 years, having been brought there by his father. Bees have been kept on the farm which I have, since 1850, without intermission. In the fall of

on page 89(1890), "Was sugar in the urine caused by honey and being affected in the same way, the doctor said the same thing. You have eaten too much honey. Now, Doctor Miller, I will hurry really refuse the plate and stop using sweets, and after six months' treatment the specific gravity was 20. I am now using saccharin to sweeten my coffee, but find that it raises the specific gravity to 26. Galen Institute says, "Eat honey if you crave it." I did one evening, and the next morning the specific gravity was 29."

THE POPULAR BUFFALO ROUTE

this summer on account of the 1901 Pan-American Exposition will be the Nickel Plate Road. Countless thousands will visit this one of the greatest expositions of modern times. The Nickel Plate Road will be the popular line. The excellence of its service is well recognized by the traveling public, and the reputation of its Pullman cars in their uniform coating to passengers is well known. When you go East see that your tickets read via the Nickel Plate Road. Give us your address, phone or call on John Y. Calahan, General Agent, 111 Adams, St., Chicago, Ill.

2-4a3t
1874 I had 7 colonies and father had 23, and in the spring I had none and he had 7. I bought a couple of colonies and in the fall of 1875 I had nine colonies and father had 56, but by the next spring I had none again, and father had only three.

I have an old log-gum in which my grandfather brought a colony of bees to this farm in 1871.

In order to yellow wax, a good plan for those who use wax-extractors is to let the melted wax run from the extractor into a pan of hot water. This will cause the wax to cool slowly, and the impurities will settle to the bottom of the pan.

I began taking the Bee Journal in January, 1883, and have nearly every number from that time, and I like it.

J. S. Barr

Trumbull Co, Ohio, Jan. 15.

Short of Stores—Sour Honey.

My bees are short of winter stores—shortest they have been in 15 years—and trying to rob oil and eat the propolis from the roof, was caused by too much rain during the past season—two weeks in April, all of June, until July 3d, and nearly all of October.

I purchased a lot of willow and popular extracted honey at a sale, and found that it had been extracted before it was ripe, and it is slightly sour and granulated. Can you tell me to what degree to heat it in order to reduce it to a liquid state? John M. Ryan. Marshall Co., Ala., Jan. 8.

[Try 160 or 170 degrees. But don't leave it standing for any length of time, as there would be danger of changing the color of the honey by almost burning it.—EDITOR.]

Getting Outside Sections Filled—Robber-Bees—Leaky Covers.

I can not report a very good crop for 1900 owing to the drought. The white clover crop was cut short in June, so the bees could work on it only three weeks. I secured the crop of cloverSecretary was killed by a lightning stroke.

I have tried the plan spoken of by Mr. Thompson in the Bee Journal, to get outside sections filled as well as the center ones. For the last six years I have practiced putting empty bai-sections to the outside of the super, and I find that it works fine.

When one is bothered with robber-bees about the hives, coal-oil is a good thing to use. Wet a cloth with coal-oil and rub it along any crack or crevice the bees are trying to enter—for instance, under the comb, or any robber will leave. I contract the entrance to any hive that robbers are bothering, and place a rag wet with oil where the robbers will smell, or better still, touch it, and they don't stay a second after smelling the oil. I never leave the rag very long after the robbers have gone.

I see quite a little in the bee-papers about leaky covers. I have hives in the home apiary that have been in constant use in the weather for 15 years, and not a single leaky lid in the apiary. Whenever a lid checks, take a good quality of shingles, paint them well, then shingle the cover: and all

Spring Hill, Tenn.

Fred W. Muth & Co.

One Minute, Please!

We beg to announce that we have gone into the bee supply and honey business. We are practical beekeepers and understand the difficulties of the trade, and know pretty well what the beekeeper wants and needs. We will give our best effort to serve the bee-keepers and the firm will give its exclusive attention to the bee supply business and the promotion of the sale of honey in this vicinity.

After visiting all the important manufacturers in the East, we have selected a line that will give the best of satisfaction. Our location—adjacent to the Suspension Bridge—is most central, and being only four blocks south from the Fountain Square, is right down in the business part of the city, and especially handy for our Kentucky and Indiana customers. Our facilities for prompt service are perfect, and our prices are quite as low as any other house in the business. Our Catalog has many new features. Send us your name so we can mail you one.

Dittmer's Foundation?

Retail Wholesale-Jobbing.

I use a process that produces every Essental comb in the best and most desirable in all respects. My process and Automatic Machines are my Foundation, which enable us to sell Foundations and Work Wax into Foundation For Cash at prices that are the lowest. Catalog giving Full Line of Supplies, with prices and samples, free on application.

GUS. DITTMER, Augustia, Wis.

the better if you give them a good dose of paint afterward. This kind of a cover will last out a long time. If the lids are flat nail a cleat lengthwise down the center, shave the corners of the cleat with a plane, then nail in the edges of the cover—that is, the eaves; then shingle as you would a gable cover, and you will have a small air-space left inside to give a little shade and make it a cooler cover in hot weather. The cleat can be one, or even two, inches thick.

EUGENE HAMBAUGH.

Past Season a Failure.

I have been in the bee-business three years, and the past season was the most complete failure. I will have to feed some of the bees to bring them thru the winter. But I don't see how I can do without the American Bee Journal.

ERNST E. BAKEN.

Wayne Co., Iowa.

Bees Having a Flight.

Today is warm and nice, and my bees are having a fine flight. I cannot keep house (and bees) without the "Old Reliable."—H. O. CONDON.

Good Season—Honey From Spanish-Needle.

This has not been a very good year for my bees. I got only 3500 pounds of extracted honey and 50 pounds of comb honey from 60 colonies, which is not nearly so well as they have done in years gone by.

I am wintering them outdoors. I made a box with three sides, leaving the front open. I used clover chaff for packing as it absorbs the moisture; they seem to be doing very well.

I move my bees every fall to the swamps of the Illinois River bottom, in order to get the honey-flow from Spanish-needle. I had 40 colonies down there last fall, and secured 1500 pounds of as fine honey as I ever saw.—JAMES GROVER.

Brown Co., Ill., Jan. 15.

Difference in Color of Wax.

Did any of the readers ever notice the difference in color between wax rendered from old brood-combs and that rendered from honey-combs? Invariably when melting honey-combs—that is, combs free from cocoons—I get a pale-yellow color of wax, while if melting old brood-combs I secure a rich-yellow, first-class article. It seems Mr. Hutchinson's experience has been the same. He says he is unable to say what causes the difference in color, and I am not sure that I know what causes it, but I am sure that by careful experimenting the cause can be found. It is possible that a broad-reaching colors the wax thru and thru? I think not. I believe it is the stain from the cocoons that gives the wax the brown or its rich-yellow color. We can tell in this way:

Melt up enough old brood-combs to get quite a lot of cocoons and residue; take some new comb and put above the piles of comb so that the melted wax will not run thru it. Of course a solar wax-extractor must be used.

My reason for thinking that the
stain from coconuts is the cause of the rich yellowness of the wax rendered from them. If an old comb is put into water it turns the water a deep color. Is it not reasonable to think that wax would be likewise affected?

W. T. STEPHENSON.

Massac Co., Ill.

Poor Season—A Bonanza in a Bee-Tree.

I lost my strongest colony last spring by neglecting to envelope the entrance when I put them away the previous winter. One day a gentleman who had two queens, so I united it with another, which left me with eight colonies, some of which I had to feed.

I sowed two acres of mustard in the spring, and the bees built up strong, and commenced to swarm about June 3d. Four colonies swarmed, and then the mustard played out, and buckweed failed, so they did nothing more until buckbrush bloomed, when they stored a little surplus, but I got only 60 pounds of surplus honey for the whole season.

I sowed three acres of buckwheat, and there were acres of heartsease and other wild flowers, but the bees did not seem to store any honey from them. We had four severe hailstorms, which might account for this.

I help to cut down a bee-tree last fall, and it was the sight of a lifetime. It was a thorn tree, and I think the bees have already left it in 4 years. The combs were a little over five feet long, and from 11 to 13 inches deep. Some of the honey was granulated; we got about 150 pounds from a wash-boiler, and a dash pan full, besides—I should think about 125 pounds in all. I hived the bees, and fed them up in the fall. I now have 13 colonies in the cellar, which I think are in fine condition.

LEWIS LAMKIN.

Woodbury Co., Iowa, Jan. 18.

THE MODERN FARMER & BUSY BEE.

HONEY and BEESWAX

MARKET QUOTATIONS

CHICAGO, Jan. 19.—Honey is selling slowly; this applies to all grades with the exception of white clear, buckwheat comb honey, which sells readily at 10c providing it is of the first quality. All other kinds of white comb honey sell at 5c. 6c, 7c, 8c, and 9c. Travel-stained and off-grades of comb are in demand at 6c, 7c, 8c, and 9c. Extracted, dark and buckwheat comb honey, 9c. 10c. Extracted, white, 7c, 9c, and 12c. Hives and white clover honey, 8c. 9c. Extracted, dark and buckwheat honey and other dark grades, 50c, 60c, 70c, 80c, 90c.

KANSAS CITY, Jan. 22.—Fancy white comb, 15c, 16c, amber, 12c; dark, 6c; demand good. Extracted, 7c; demand quiet. Bee- wax, 2c.

W. H. BREWER, Produce Co.,
St. Louis, Mo.

BUFFALO, Jan. 12.—All kinds of honey are quiet and difficult to make a sale. Outstanding only some sells, 10c; 1c, 1c; choice and No. 1, 15c; 16c; 17c; choice and No. 1, 18c; 19c. Some kinds in liberal supply; many to be recommended. Extracted, 15c; and not wanted in Buffalo. Bee-wax, 20c.

BATTGERSON & CO.

ALBANY, N. Y., Jan. 18.—Honey market is duty on grade, but still grade, strong on fair light demand. White bee in good condition, not tested, 15c, 16c, 17c. Other grades, 10c for comb, 18c, 19c. Beeswax, 12c, 13c; mist, 15c. Extracted, white, 8c; amber, 9c; mist, 6c; dark, 5c.

B. R. WRIGHT.

BOSTON, Jan. 18.—Fancy No. 1 white in cartons, 25c, A No. 1, 16c, No.1, 15c, 16c, with a fair light demand. White comb good, on call for dark honey this year. Extracted, 15c; light amber, 7c; Bee-wax, 27c.

CINCINNATI, Jan. 16.—Market very quiet. No change in prices. Fancy white comb sells for 1.40. Extracted, dark, sells for 1.5c, and lighter grades bring 65c-75c. Fancy white table honey brings from 90c to 1.00.

C. H. WEBER.

NEW YORK, Dec. 22.—Fancy white, 15c; No. 1, 14c, 15c; white, 14c, 15c; No. 2, 14c; 2c, buckwheat, 10c. Extracted in fairly good demand at 75c for white, and 7c for amber; off grades and Southern bars are at from 65c to 75c per gallon, according to quality. No much demand for black honey at present, but some little selling at 80c Per Bee-wax firm at 28 cents.

Demand continues good for honey; supply fairly good. Extracted continues in demand with enough supply to meet requirements.

HILDEBRAND & SOKLEEN.

DETROIT, Jan. 19.—Fancy white comb, 15c, 16c, 17c; dark, 2c, 3c; 5c, extracted, white, 70c-75c; amber and dark, 65c-60c, Bee-wax, 26c, 27c.

M. H. HUNT & SON.

SAN FRANCISCO, Jan. 9.—White comb 13c cents; amber, 11c; dark amber, 10c. Extracted, white, 75c; light amber 60c; amber, 55c. Bee-wax, 25c.

Honey stocks of all descriptions are light, and values are being as a rule well maintained at the quoted range. Firmness is naturally pronounced on light amber and water white alike, and the latter is becoming scarce.

HONEY MARKET.—We may have a customer within a short distance of you who wants your honey or may have a customer who buys with all the markets; therefore write us regarding your crop, stating quantity, quality, and lowest cash in consideration for a sample. We are ready to buy any business man in this city.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

HOUSTON, TEXAS

[This cut is the full size of the knife.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The holsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How To Get this Valuable Knife.—We send it postpaid for $1.25, or give it as a Premium to the one sending us six photographs of the Bee Journal (with $7.50). We will club the Novelty Knife and the Bee Journal for one year, both for $1.75.

AMERICAN BEE JOURNAL

Feb. 14, 1901.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.
144 & 146 Erie St., Chicago, Ill.

*Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICE:
The Subscription Price of this Journal is $1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, Dec. 31 on your label shows that it is paid to the end of December 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "dh" or "edh" to "th" when so pronounced, except when the "th" affects a preceding sound. Also some other changes are used.

The Bee-keeper's Guide

Or, Manual of the Apiary.

BY PROF. A. J. COOK.

460 Pages-18th (1899) Edition-18th Thousand-$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 18th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to each present subscriber, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with $2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for $1.25, or we club it with the Bee Journal for a year—both for only $2.75. But surely somebody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try it. WILL YOU HAVE one?

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO, ILL.

THE BEST WHITE

ALFALFA HONEY

Extracted Honey

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY this is the famous White Extracted Honey gathered in the great Alfaflake regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfaflake extracted.

We have a good stock of the fine WHITE ALFALFA and WHITE BASSWOOD EXTRACTED HONEY that we can ship by return freight. Most bee-keepers must have sold all their last year's crop long before now, and will be ready to get more with which to supply their customers. All who have had any acquaintance with the above-named honeys know how good they are. Why not order at once, and keep your trade supplied?

Prices of Either Alfalfa or Basswood Honey:

For the purpose of selling again.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 93¢ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are bont. This is all.

Absolutely Pure Bees' Honey.

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you, I feel that I'm something of a heretic, to sell several thousands pounds of honey of my own product and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

C. C. MILLER.

McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

20 cents Cash paid for Beeswax. This is a good time to send in your Beeswax. We are paying 20 cents a pound—CASH—for best yellow, upon its receipt, or 28 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.
5. Yes, the street cars run within one-half block of our new office, at 144 and 146 Erie street. The Wells street cars can be taken on what is known as the down-town loop, and for 5 cents you can come to our office from the center or main business part of Chicago. If one happens to get on a North Clark street car there will be no harm done, as this line crosses Erie street two and one-half blocks east of our office. But the least walking will be done by taking the Wells street cars.

6. We are usually not very good guessers, and so you will have to explain about your having had “only one birthday.”

Management for Comb Honey.—Mr. L. Stachelhausen gives his method of producing comb honey as follows, in Gleanings in Bee-Culture:

As soon as the honey-flow commences, and the hive is now busy, we think it is best to set supers with sections on top of our hives, a hive is prepared with starters only. We bring it to the hive selected for the new manipulation. The old hive is set on the bottom board, and set aside to be handy for the following manipulation. The new hive is set on the old stand, and an empty hive-body on top of it. In all these operations I use smoke, but never too much, nor too close to cause them to fill themselves with honey. One of the comb-combs, with bees and all, is put into the hive and then the bees is brushed from every frame into this hive. The most important thing in this operation is, that the bees fill themselves with honey. A little sprinkling with a solution of sugar in water can be used if the bees do not suck up the open honey.

The combs from which the bees are brushed into the new hive are sorted into different empty bodies near by—comb-combs, honey-combs, or empty ones separately all. It is necessary to look for the queen. She is brushed into the hive with the other bees. At the same time the honey-body, lay a queenexcluding honey-board on top of the new hive; and a super with sections (containing preferably full sheets of foundation and some bar-combs) is set on top of this, and the hive is closed.

The next day the frame of brood is removed, and more super room given if needed.

Propolis.—As there is a possibility that propolis may yet become an article of commerce, the following from a report of a conversation reported in the British Bee Journal will be of interest:

“Propolis” was a remarkable product, medically used in liquid, not salve form as many supposed. It was considered to be a wonderful antiseptic and had been employed successfully for wounds in South Africa. It was supposed to take the place of iodine, and some experiments showed that with about 3 percent omission of the liquid certain bacteria were killed off in two minutes, and other bacteria in three minutes. This “propolis” was stated to be very useful for foot and mouth diseases. The mixture was also said to be very rich in oxygen and carboonic acid gas in a liquid form, and contained another alkaloid at present unknown. With regard to “propolis,” Mr. Harris would like to know, seeing that its antiseptic properties had been proved, what the general opinion was as to its efficacy in the treatment of foul brood.

Mr. Reid, who had examined the bottle and smelt its contents, said that the liquid smell of benzolamine, and might be a germicide. Mr. Bric suggested that the germicidal properties probably existed, if at all, in the unknown alkaloid.

Mr. Reid said that propolis, when taken out of the hive, always contained wax, generally it was nearly half wax, and wax invariably contained propolis, except when just secreted. It was possible to separate five or six different substances by the use of various solvents, but what those substances would do, or whether they were specific antiseptics, it was difficult to say. The bees themselves used propolis as if it were a propolis, it was intercalated over objects of aversion (such as a dead mouse), which got by means into their hive, and wax and propolis—always the latter—and which would cover the antiseptic provided for them, with their own, which was better. A large percentage of propolis would be found in the dark cappings of cells containing foul brood.

A Suggestion for the National.—At the last meeting of the Chicago Bee-Keepers’ Association the following was unanimously adopted:

WHEREAS, The National Bee-Keepers Association has provided that local associations may join it in a body by payment of 50 cents for each local member; and,

WHEREAS, Abundant advertising is necessary for the success of any enterprise; therefore,

BE IT RESOLVED, That we, the Chicago Bee-Keepers’ Association do herein resolve to urge the National Bee-Keepers’ Association to provide all local associations in America with printed matter setting forth the objects and aims of the National Association, so that the secretaries of such local associations may be able to put such printed matter into the hands of all bee-keepers in their territory and jurisdiction.

From the fact that there has been some call for information concerning the objects and work of the National Association, it would seem that there should be something printed for free distribution—that it furnish the desired information—so that it would not be so difficult for the officers of the local associations to get members.

It was at our suggestion that the provision was made in the constitution of the National Association to admit the members of the local associations at 50 cents each. We still
think that it was a good move, and believe that the provision would be taken advantage of if local bee-keepers understood about it, and especially if they were informed concerning the good work already done by the National, and also as to what it purposes to do.

In the interest of every bee-keeper in America. We trust that the board of directors of the National Association will act on the suggestion made by the Chicago Bee-Keepers' Association.

We also think that it would be a good thing if all the bee-papers would carry a standing notice, that every one desiring to learn about the work of the National Association could do so by sending to the general manager for literature that would explain the objects of the Association. It can not be expected that bee-keepers will unite with an organization until they know something about it. They must be led to see that it will pay them to do so before they will hand out their dollars-a-year-dues.

We believe that any legitimate organization will not suffer for the lack of funds if those who should be interested are shown that it is to their interest to support it, and that its objects are really wise, and for the advancement and defense of right principles and purposes.

Let the board of directors of the National Association prepare at once suitable literature, and begin its circulation as soon as possible thereafter, so that by the time of the next annual meeting its membership can be counted by the thousands instead of by the hundreds. We are ready to do our part in pushing the work of securing membership, thru the columns of the American Bee Journal, and have no doubt that the other bee-papers will do all they can along the same line.

With united effort we believe there is no reason why the National Bee-Keepers' Association should not have a larger membership than any of the other agricultural organizations now in existence in this country. We believe the machinery of our Association is all right, and all that is needed is to work it. It needs to have its joints limbered up with the oil of enthusiasm, and the motive power of earnest effort applied to start it and keep it going.

Weekly Budget

Mr. O. O. Poppleton, of Dade Co., Fla., wrote us as follows, Jan. 29th:

"Bees are breeding nicely with an abundance in the hives. They would be gathering quite a little surplus honey now if the weather was only a little warmer."

"I had the misfortune, a couple of weeks ago, to drop the nx on my left forefinger, just above the knuckle joint, cutting it quite badly, and breaking the bone. The surgeon thinks the finger can be saved without its being stiff. It is doing fairly well now, but it will take a year for the bones to knit so the hand can be used. I don't find any special fun in being one-handed."

We regret to learn of Mr. Poppleton's accident, and trust that in time his finger may be all right again. —

Editor Will Ward Mitchell of the Progressive Bee-keeper, after quoting the account we publish in the American Bee Journal of Jan. 10th, concerning their "fire-water" disaster, gives this appended paragraph:

"We regret our brother publisher's misfortune; and hope his mite will pay any back dues at once, as Bro. York has been giving us his best efforts, and the "Old Reliable" is far ahead of what it ever was before.

We know of nothing that would be more cheering to Bro. York than for delinquents to "pay up" and send in their renewals."

The Wisconsin Convention was held at Madison last week as previously announced. It was a good meeting, and quite well attended, considering the poor honey season the past year.

The officers were all re-elected for the ensuing year, as follows: President, N. E. Franke, of Madison; Vice-President, Miss Ada L. Pickard; and treasurer, Harry Lathrop.

Next week we will have more to say about the meeting and some of those who attended.

A Dozen of the wealthiest capitalists in the country—men who wield absolute control over immense business enterprises—will tell the readers of the Saturday Evening Post (Feb. 16th) why they remain in the race which they have already won.

Each of them writes frankly whether he makes money for its own sake, for the sheer joy of working, or to get the power with which vast capital invests itself. Curtis Publishing Co., Philadelphia, Pa.

Mr. H. C. Binger, one of our subscribers in Minneapolis, Minn., wrote us Jan. 28th as follows:

"Father passed away Jan. 15th, at the age of 67. He was born in Mecklenburg, Germany; when 28 years of age he came to this country and settled at Rockford, Ill. He was married to Miss Friederike Fischer, who, with five children, survive him. In faith he was a Lutheran, and was a kind and loving husband and father."

Contributed Articles.
No. 12. - Interesting Notes on European Travel.

BY C. P. DADANT.

Before I leave Paris and its surroundings, I must tell you of two very pleasant trips I took in company with my daughter and our good friend Mr. Gariel, of whom I have often spoken. The first was a visit to the factories of the famous honey-trade in the small town of Chartres—some 60 or 80 miles out of the capital. The flying express took us there in the morning and brought us back in the evening.

Of the factory itself I shall say nothing. It was a busy place, but those of our friends who are acquainted with American factories would find nothing of interest in anything I might depict, for their methods are not as practical as ours, and the work turned out is not as good, as I said in a former article, but this is only because that is made here, but I could perhaps give instances of the great economy practiced in the saving of material. This factory manufactures hives only as a secondary business, their main occupation being the making of railroad supplies of different kinds. I saw large piles of old railroad ties (which would be sold here for fire-wood) cut up into small pieces, and a good portion of the material set aside for the manufacture of a number of small articles which could very readily be cut out of this refuse. It takes more time, it is true, to pick out the sound wood, but the Europeans can not use our axiom, "Time is money," to as much of a purpose as we can, for altho with them time is also money, there are many things that are more valuable than man's time over there.

The cheapness of labor is very certainly responsible for some very queer notions. For instance, a certain manufacturer seriously asserted to me that it was cheaper for them to have the lines cut in the factory than to have them done by hand in the field. "It costs so little," he said, "and the work of a smoothing-plane is always nearer than that of a steam planer.

And in the use of second-hand lumber we need not be so afraid of the nails which would very soon spoil the steam knives."

I tried to discuss the matter but it was of no use, and it is also evident that many working men do all they can to discourage the employment of time-saving devices which they consider as their enemies.

We were splendidly treated by the manager, who is evidently an able man and who asked me a number of questions about America and its factories. He was well acquainted with a gentleman who was in the employ of the railroad company as civil engineer, and who had been sent to America to buy a number of locomotives, and whom I happened to meet on our trip across the ocean. So we had quite a talk about the great steps that America is making in her trade with the world at large, and the numerous exports which are just beginning to bring the New World into competition with the Old.

We partook of a very nice dinner in his home, close by the factory, and employed the afternoon hours previous to the departure of the train, in walking about the old city, its walls, and the little streets and churches, at their foot and in which the housekeepers were busy washing their linen. It was very picturesque. On another day we went with Mr. Gariel again, to visit an old and experienced bee-keeper—Mr. Delepigne, who, with his family of Paris. Mr. Delepigne is not only a practical apiarist, but is also a writer on bee-culture. He writes regularly for the weekly journal entitled, "La Gazette du Village," which might very properly be called the "Farm Journal" of
France, for it is a neat, newsy, and practical farmer's paper, full of interesting information. The trip to Meulan reminded me very much of "L'Abbe Constantin," by Halley. I have no doubt many of the readers of the American Bee Journal haveread that little book, for it has been translated into English and has become a classic.

Well, the kindly, good-humored, cure, his old servant, his little garden, the little church, the little village, and even the big castle at a short distance on the opposite side of the road—all these things look familiar altho seen for the first time. We found ourselves there with Mr. Giraud, whom I have mentioned as so successfully putting in practice the Doolittle method of queen-rearing, and with an old gentleman—a count who kept bees for pleasure—and we had quite a talk on America and our American celebrities in bees. If I am not mistaken, two of the persons present could read English and had read Gleanings and a few copies of the American Bee Journal and "A B C of Bee Culture.

Why it is that so few of the French can speak or read English is more than I can comprehend, but they seem to think it much more astonishing that not all foreigners can speak French. They seem to think that the French language ought to be an indispensable part of any good education.

Entrance Gate to the City of Chartres, France.

I think this makes the French more exclusive than other nations. Then their literature seems to encourage them in their ideas of exclusiveness, for it is certainly very wealthy in able works and books which have become classics, and more translations seem to be made from the French than from any other tongue.

We left Meulan after a very pleasant chat and a visit to the fine park of the castle across the way.

What a difference between European and American landscapes! I vainly tried to imagine myself in America, at different times. There was always something in sight to dispel the illusion. The village houses huddled together as in a nest; the white walls and red tile roofs; the magnificent country roads with their avenues of trees on each side; the little patches of land looking for all the world like so many elk herds lying side by side in the sun; the smooth little streams of water, running quietly even to the full to the edge of their grassy shores, and shaded with willows and poplars along their windings; the herded cattle, the two-wheel carts and their heavy loads, even the country faggots of brushwood—made a strange world. O, those buggies! What a look of contempt our farmer boys would give them! They are not buggies, but carts very gaudily painted, but so heavy! Wheels five feet high, shafts made of 4x4 timbers, springs to suit, harness ditto, and a big Percheron for a trotter. I nowhere saw one of our American spider-web buggies. I have no doubt that there are some in Paris, yet they must be scarce. There are plenty of fine carriages, and expensive equipages, but you can not, on the public roads, meet a light top buggy at every turn. Their lightest buggies are made to last, and are heavy in every particular. This seems an absurdity, for such vehicles as we use here, on our abominable American roads, would be a delight over there. The harness also is heavy. It seems as if they were afraid the horse would break it, and there is enough leather in the lightest harness to make three such harnesses as our buggy-horses wear.

A Few Words of Comfort for "Old Grimes."

BY "THE MILLER O' THE DEER."

"Old Grimes is dead; that good old man, We ne'er shall see him more."

So the old ballad has it, but it now seems that he was not dead, but sleeping, until the morning of some long ago when Rip Van Winkle, and he has only just awakened. (See page 20.) Poor, sleepy Old Grimes, who would have thought that one of your kindly, genial, helpful nature would have been missed in that way. But we feel great encouragement in the way of any one, even of one so lost to all rectitude as to try to invent new devices in beedom.

You kindly old men did, indeed, beat paths for the rest to follow, even as our forefathers blazed the rude trail to the frontier, but who now would care to stumble over the logs and stones of such paths, when the same end may quickly be reached by automobility? Those old paths are full of pretty places, romantic spots and picturesque corners where wild flowers lend their sweetness and the drowsy hum of the bumble-bee invites one to tarry and repose. We all love those places to rest in, and the companionship of the placid plodder of these byways, but they are not for present-day commerce, nor can we travel over them in up-to-date vehicles.

The feeling which caused you, dear Old Grimes, to complain, is but a sound and safe conservatism allowed to run riot. But then, we must needs be charitable to you, for your heart is clearly showed that you have in mind only the devices shown in ancient times, and which indeed needed bees from fairy-land to construct combs for use in them.

What a nightmare your dreams have been, for now, just half awake, you mutter of slicing-machines, of four-horse hollows, of long adjusting, of high prices, of revolutions of systems, of new outfits, and other fits and misfits. Come, come, Father Grimes, take a cold plunge, shake thyself and awake, for thou art still more than half asleep. Thy ideas and reasoning be as of cobwebs in thy brain, and are not worthy the 20th century.

Tis far from the thoughts of these troublesome inventive fellows to put obstacles in the paths of you old fellows—nor would they much rather. Why, for instance, a smooth highway, and when you longingly turn from its rush and bustle into the sweet, tho sleepy, quiet of the old paths, they would furnish you with a rugged cane to help your tottering steps over its stones and hummocks.

I know a little about some of these new-fangled machines, and to save you from further worry let me whisper to you that an uncappr costing $20, and that has to be "adjusted," is as far from the realized dreams of those ingenious fellows as your buggy was from the olden one newly nearly so, and much, and their capacious maw will take all the combs as they come, and deliver them to you neatly uncapped, and at the rate of 20 a minute, if your trembling hands can feed them in so fast.

Dear Old Grimes, we all love you for your kindly charities, and for that quaint figure in its "old black coat, all buttoned down before;" even tho the color is now rather gray from the dust of many years.

So let us help you as you tread That path of olden times; All undisturbed, rest in thy hut For evermore, Old Grimes.

Getting Bees to Swarm—Requeenng, Etc.

BY EDWIN BEVINS.

LAST spring I discovered a means of getting bees to swarm at almost any time when swarms are desirable. One of my colonies was wintered in two sections of a sectional 8-frame hive, sections 7½ inches deep. Early in May the colony got so strong that in order to prevent swarming I placed the bottom section on a box, filled with drawn combs. When swarming time came, I raised the upper story and put a queen-excluder under them, then shook the bees from every frame down in front of the entrance. I felt sure the queen was below, and could care the brood in bills. The paper story to mature and make room for honey to be stored there by the time there would be much to store.

No further attention was paid to these bees for several days until one day a neighbor express a desire to look over the apiary. In showing him around I happened to raise the cover of the hive and lift some of the combs. To my surprise I found brood in all stages of development, and every
AMERICAN BEE JOURNAL

Feb. 14, 1901.

COMB FULL.

One of the combs I found the queen and put her below on the second story. At the next day but one, some one coming into dinner said the bees were swarming. I said, "What are the bees swarming for? I don't believe there is a queen-cell in the yard." But noticing that the air was full of flying bees I went out to see what it was they were coming from. It was from the hive in which I had put the queen below the day but one before. The cause of the swarming was not hard to understand. The bees clustered in two places, and, suspecting that each cluster had a queen, I hived them in two. One cluster was large, and I hived it on 9 Langstroth frames; the other I put into an 8-frame dovetailed hive. Each cluster had a queen.

After having them I went to see what was going on in their old home. I found a queen in possession there, and quite a number of cells, from which the queens had issued. I reduced the old hive to two sections, and left it that way for the balance of the season. When pack for winter it was so heavy with honey that I did not care to lift it. I took nothing from it in which to store for winter, with the understanding the season had been unusually poor one for honey. These were all the swarms I had the past season.

Another colony wintered in two 10-frame dovetailed hive-bodies on 17 frames, had a queen nearly or quite as prolific as the one just mentioned. The last of April the two stores of this hive were brought in under another story, and a queen cell was put into it. I kept the hive full of bees, and the queen seemed to be about half full. As the upper story contained much honey I removed the middle story to another stand, knowing that most of the bees would go back to the old location. I did not see this colony, as I had to start queen-cells I don't have a queen on the first comb I raised. Another mature queen was found on another comb. Then I formed a nucleus and gave it to one of the queens. The queen left in the hive proved to be uncommonly good one, even if it was reared in a manner which queen-breeders generally condemn.

SELECTING A HOME BEFORE SWARMING.

Do bees intending to swarm hunt up a place to go before the swarming takes place? I guess they do sometimes. One season I noticed bees in great numbers entering a hive which stood on another hive at the upper side of the bee-yard. The hive had some empty combs in it. I looked about to see where the bees were coming from, and found them pouring out of a hive at the lower end of the yard and taking a bee-line for the hive at the upper end of the yard—a distance of about 4 or 5 rods.

REQUEENING COLONIES IN THE FALL—MAILING QUEENS.

I unqueened and requeened one-fourth of the apiary last fall. Most of the work was done in October, but it was not finished until some time in November. One reason why I like to do this work so late in the season is because in almost every instance I found the bees too deep, and as they have their supers of honey and the weather was cool I don't have to be very particular about the time of introducing. In two instances there was a little brood, but as the queens were delayed I had a chance to destroy queen-cells. The queens were from different parts of the country, and from breeders of good repute, and I have reason to believe they were all safely introduced.

I shall continue to order queens to be sent thru the mails, as I do not believe that many are injured in transit. Four queens ordered last fall were received dead. One of them was delayed in the mails until the weather was hot. Two others had received such a shock that the cages were split from end to end, and had been tied up with string. The other cage had the queen and the bees all dead in it, doubtless caused by the same shock which split the cages of the other queens, as they came in the same mail.

When I received queens with pasteboard covering the entrance to the candy it was promptly torn off, and I had no question killed in consequence of being released too soon. I do not think that Mr. Fred Tyler need to worry about his bees getting too warm pack as he describes on page 766 (1900).

The Premiums offered this week are well worth working for. Look at them.

Convention Proceedings.

BY DR. A. B. MASON, SEC.

(Continued from page 8.)

MELTING CANDIED EXTRACTED HONEY.

QUESTS.—What is the lowest temperature at which candied honey will melt?

Mr. Aikin—I think about 100 degrees, or a little better, but you must continue the heat for a long time; about 110 to 120 degrees will melt it in a few hours. The highest degree that I wish to subject my honey to is about 160 or 170 degrees, after that it begins to boil the flavor. An additional question on the same sheet is: "What is the highest temperature it will bear without injury?" About 160 or 170 degrees is high enough. I would rather melt at 140 or 150, keeping it a longer time at that degree than to use the higher temperature.

APIS DORSATA AND THE NATIONAL ASSOCIATION.

QUESTS.—What is the attitude of this Association in regard to importing Apis dorsata, the big bee of India?

Mr. Aikin—If I am to answer that, I believe it is opposed. I don't know.

Dr. Mason—Opposed until we know more about it.

QUESTS.—Have any steps to procure or test these bees been taken?

ANS.—Yes, there have.

Mr. Benton—The attitude of this society did not seem to be that at the Buffalo convention, and I was wondering whether it had changed, considering your answer.

Mr. Aikin—I judged from the sentiment as expressed thru the bee-papers of late—I said I thought, I do not know. I suppose the only way we could come at it would be by taking the temperature of the people here now. Are you thru with this subject?

REQUEENING AN APIARY.

QUESTS.—What time of the year is best to requeen an apiary, all things considered?

Mr. Aikin—Dr. Mason, answer that.

Dr. Mason—Why, I really don't know. I prefer to do it during the honey-flow, myself, and by natural methods. I don't use the artificial methods.

A Member—Early or late?

Dr. Mason—Late.

A Member—How late?

Dr. Mason—For convenience, that is all. I don't believe it makes any difference as regards their good qualities which stage, early or late.

A Member—You would say just after the honey-flow?

Dr. Mason—Just as it is closing up, before it closes. They must have the vim and energy they have when the honey-flow is on.

A Member—How often would you requeen?

Dr. Mason—Once in two years.

MATING IN CONFINEMENT—SPREAD BroOD.

QUESTS.—Can the queen mate with the drone if the queen and drones are confined in a tent or other inclosure, say, 200 x 100 feet?

Dr. Mason—No.

QUESTS.—Is it any benefit to spread brood in early spring?

Mr. Aikin—Prof. Gillette, please answer that.

Prof. Gillette—Let some one with more experience answer that.

Mr. Poppleton—Yes.

A Member—Sometimes it is, and sometimes it is not, depending principally upon the man or woman who manages it. If you know how, it is all right; if you don't know how, go slow.

KEEPING EXTRACTED HONEY.

QUESTS.—How long will extracted honey keep?

Dr. Mason—I don't know; it has never been tried.
Mr. Aikin—I have some that is getting to be pretty nearly half old as I am.
Mr. Coggs—all I have some 30 years old.
Mr. Aikin—is it good?
Mr. Coggs—all I haven’t opened the package.
Dr. Mason—I have some that is 15 years old that stands open—good yet.

TO PREVENT GRANULATION AFTER FEEDING.

Ques.—For feeding what would you put with sugar syrup to prevent granulation, and in what proportions?
Mr. Aikin—Some use honey; I never had any experience, I can’t answer it.
Mr. Hatchinson—Honey is all right for that; about one-quarter honey is all right.
Mr. Benton—One-fifth will do.
Mr. Acklin—Percolate the syrup and you don’t have to put any honey in.

WHAT TO DO WITH FERMENTING HONEY.

Ques.—What can you do with frames of honey that is fermenting?
A Member—Extract it and sell it.
Mr. Aikin—Feed it to the bees, or make vinegar of it.
A Member—Will it do to feed to the bees?
Mr. Aikin—I wouldn’t feed it to the bees any time except when they could fly freely, and I have some doubt about it then; I said that because somebody else was recommending feeding.

SPENDING THE FUNDS OF THE ASSOCIATION.

Ques.—How large a percent of the funds of this Association should be used in the prosecution of adulterators of honey?
Mr. Abbott—It depends upon circumstances. We would have to decide that when the case came up.
Ques.—Would the Association deem it better to have a good, fat sum in the treasury, or should the money be very nearly exhausted each year in the various lines of work for which the Association was organized?
Mr. York—I think it ought to spend its money in the interest of its members. If more is needed at any time for legitimate purposes, call for more from the members.
Dr. Mason—Money is no good when it lies idle.

AN ASSOCIATION BRAND FOR HONEY.

Ques.—Should this Association prepare an association brand as a guarantee of purity of honey, which it can supply to certain applicants upon the unanimous approval of the board of directors?
Mr. Aikin—as far as my part I would answer that in the negative, until this Association becomes more properly a business concern.

BEEs POISONED FROM UNTIMELY SPRAYING.

Ques.—Is it a fact that bees are poisoned and brood killed when fruit-trees are sprayed while the trees are in bloom, and the bees are visiting them?
Mr. Aikin—Colorado people say so.
Mr. Benton—Other people say yes.
Mr. Aikin—A person in my county was convicted and fined for spraying his trees while in bloom, and thereby killing his neighbor’s bees.
Mr. Prisk—I think in referring to that the other day, when I spoke about the sulphuric acid killing the bees where the smelters were, somebody made a reply that they thought that smelters did not kill the bees. In our town we have large smelting works, and in our yard, and for blocks around, everything is killed. I have known arsenic to collect to a large amount in a few hours and to kill the shrubbery around there, and we thought that probably it fell to such an amount on the bloom that killed the bees. When we noticed the bees always came home as if they were tired out, and did not leave their hives.

ARRANGEMENT OF BEES WHEN SUPERING.

Ques.—When putting on the supers for comb honey should the natural arrangement of the brood be interfered with?
Mr. Hutchinson—I should say no.
Mr. Hatchinson—I think that question myself, because I tried an experiment this summer that convinced me it is profitable to interfere with it, and judging from this one experiment I say decidedly it is the right way to handle the brood. My experiment was to move all the eggs and unsealed larvae to the outside of the hive, to fill the hive full of brood, and put all the bees and unsealed larvae clear on the outside. The result was I got a big yield of comb honey, and the outsiders were filled up first. Whether it would work always that way or not I don’t know. Of course, I only tried it one season; but I think it is a subject worthy of further experimentation.

Mr. Abbott Mr. Hatch is appointed to experiment next season.
Mr. Hatch—I undoubtedly will.

THE HONEY CROP AND HANDLING.

Ques.—What percentage of the national honey crop is represented by the membership of this Association?
Dr. Mason—I don’t know, and I don’t believe anybody else does.
Ques.—Would it be practical for the Association to handle the crop of 1901 for its members?
Mr. Abbott—No, nor at any other time.
Dr. Mason—I don’t believe that; that is the last part of Mr. Abbott’s statement. I am a firm believer in cooperation.
Ques.—If impossible, by what obstacles is the possibility precluded?
Dr. Mason—That matter is like all other matters—it has to develop itself slowly. I believe that this Association will sometime get in position to handle the honey of its members; can’t be done yet; it is going to take time.
A Member—Is it not possible for this Association to go into Bartlett-stock combined and sell honey, buying all the honey in the country and handle it for the benefit of the members? I think it is possible. I don’t see anything to prevent it, if all the honey could come in here and be graded by interested parties.
Dr. Mason—Are you asking me that question?
A Member—Yes, sir.
Dr. Mason—I think I can answer that question. I don’t believe there are a dozen members of this Association that would be willing to ship their honey and wait for their pay; it takes money to run any business. Will you put the money in?
A Member—The honey will bring the money.
Dr. Mason—It has to be handled, and all bills paid; it takes money to run any business; this has to be develop.
A Member—Why can’t the bee-keepers, furnish that money pro rata?
Dr. Mason—Well, I don’t know why they can’t; but will they?
Mr. Aikin—I would like to say for the information of all interested, that some of us in Colorado have been thrashing that ground over and over again in the last four or five years, until we have got down to a working basis; I am going to tell you a little of that tonight.
Ques.—Should this Association undertake to find a market for its members?
Dr. Mason—It is answered in what has already been said—not at present.

WIDE AND DEEP HIVE-ENTRANCES.

Ques.—Is it an advantage during hot weather to use wide and deep entrances in the production of comb or extracted honey? If so, is there any danger of going to an extreme?
Mr. Wood—I use both large and small entrances, and I see no difference. I use chaff cushions on top of my hives the year round, and I find them better than none at all.

COMB FOUNDATION—COMB HONEY.

Ques.—Is it more profitable to use thin foundation than extra-thin in supers? and, if so, why?
Mr. Aikin—I believe extra-thin would be my answer, and the why of it as put before us this afternoon by Prof. Gillette.
Ques.—Is comb honey in drone-cells as pretty and as white as that in worker-comb?
Mr. Aikin—It depends up on who is looking at it: ordinarily it doesn’t appear as white looking.

REMOVING SUPERS—HONEY OozING OUT.

Ques.—When should the supers be taken off?
Mr. Aikin—When they are full, and the unfilled ones as soon as the honey-flow stops.
Mr. Holdren—What is the cause of honey oozing out of the cells after it is filled all up in that way?
Mr. Aikin—I don’t know why it is—fermentation, perhaps.
Mr. Holdren—What causes the fermentation?
Mr. Aikin—I wouldn’t know how to answer that, unless it is too much water—urine honey.
Mr. Holden—I had my honey in a very light place upstairs, and some of it got out of the box.

Mr. Abbott—Bees frequently gather honey that will ferment, especially in localities where there is basswood. Sometimes bees gather honey during damp weather that they cannot, fully ripe, and I have had large quantities of it ferment in that way, and just as soon as it becomes ripe it will granulate. In some seasons I was troubled badly with it in Missouri, and other seasons I would not have any of it. I think it is owing to the dampness of the honey when gathered, the honey will bear more or less of it.

(Continued next week.)

Report of the Utah Bee-Keepers' Convention.

BY A. F. STEVENSON.

The Utah State Bee-Keepers' Association held its annual convention in Salt Lake City, Oct. 6, 1900.

The meeting was called to order by Pres. Lovesy, and after the reports from committees were read he gave some general reports from different parts of the State. The meeting was then thrown open for discussion of topics of general interest to the fraternity.

General Reports from Members.

Andrew Nelson, of Emery Co., had harvested a very good crop of honey during the past season, but he said that something was wrong with some of the bees, possibly foul brood, and, if so, he would like to know of some way to get rid of it. The case was described, and a discussion among some of the experienced bee-keepers followed, and they decided that it must be pickled brood. Some time was taken in discussing cures for foul brood. The bees should be exposed to early in the spring, and if any brood is found with the backward presentation it is sure to turn out to be foul or pickled brood, and when such conditions are in evidence the bees should be transferred onto foundation in clean hives; but if they are left until rotten it is better destroy them and be done.

James Jackson, bee-inspector of San Pete Co., said there was some foul brood in Mt. Pleasant and other parts of the county, and it seemed to be almost impossible to get rid of it entirely.

Mr. Lovesy found in 10 years of experience that it was always best to transfer the bees just as soon as the backward presentation was noticed, even if at a time when the bees would have to be fed, as even at this early stage the disease will have been in the hive two weeks or more, and the young larvae in their agony have turned over, leaving the head in the bottom of the cell, which makes it impossible for them to hatch out.

Joshua Terry, of Salt Lake Co., reported a poor crop, and the situation very discouraging. His bees had died off during the season, as it is the usual case being smear-smoke. Mr. Cornwell of the same county was also a heavy loser from the same cause. He moved some of his colonies several miles from the smear-smoke, and they improved, and also in regard to the purchasing began to do better, while all of those left at home soon died. A resolution was adopted authorizing the Association to use all possible legal means to get rid of the nuisance.

L. Yeale, of Tooele Co., reported a fairly good crop, tho not as heavy as some others. Several reported a light crop in the southern part of Davis County, while in some of the northern portions the flow was good. They reported some cases of foul brood, and no inspector to attend to it, the people expected to have one soon.

I. Lysander had experience in packing for winter with burlap, straw, chaff, etc. Mr. Stevenson was also successful in packing with straw and chaff mixt, raising the covers about 1/2 of an inch for ventilation.

Geo. Hone reported that Utah County had produced only about half the amount of honey as others, the weather being dry. In speaking of winter packing he thought that two or three thicknesses of burlap over the brood-frames, with a super on top, was a good way.

Roderick Schach, of Salt Lake Co., reported a poor crop, besides having a loss of colonies. He thought for winter was all right, but the bees must have sufficient ventilation or they would sweat, get weak and damp, and then die.

A general discussion followed in regard to exhibiting at Fairs. Some of the officers of the Association for their efforts in supplying members with information as to honey prices, the history of keepers, crop prices, and thus benefit the bee-keepers and the industry.

Several from Weber County had a full average crop, some of the bee-keepers there averaging more than twice the amount of both comb and extracted that some bee-keepers on the Salt Lake and other counties secured. Mr. Reese secured over a car-load of No. 1 extracted honey. As prices have been above the average this season he is one of the lucky ones.

The President's Annual Address.

The many reports we have received taken as a whole are not very flattering or encouraging. While we have received some flattering reports of a good honey-flow and a good crop of comb for bee-keepers in those parts of the State, further south they have not been as good; and while in the northern parts of the State the reports have been fairly good in some localities, in the north counties, owing to the shortage in comb the reports have mostly been from 1/2 to 1/3 of a crop, the average in some instances being as low as 30 to 35 pounds. One of the remarkable features of the season has been that there was very little honey in some localities—favorable localities a few miles distant would there be a good honey-flow. These favored spots were generally in or near the base of the mountains, where there was plenty of irrigation, and few or no grasshoppers. To many of our bee-keepers as the last year we have been having a destroyming failure. Altho we had a beautiful spring, the dry, hot June—the hottest ever known in the State—dried up the bloom and irrigation; and as misfortunes seldom come singly, there the bees were left in many localities to feed in some localities that they ate everything green. When things began to look discouraging, both for the past season and the next, our friends—the gulls—came by the tens of thousands and devoured the grasshoppers that were hatched. So most of the bees have plenty of honey for winter, with some surplus, and the chances are more favorable for another season, on account of the work of the gulls.

The Association has been of material benefit to many of its bee-keepers, in keeping them posted as to the value of bee-products; we have adopted a committee by Mr. F. L. Thompson, of Colorado, and the bee-keepers that have been governed by the advice given, have saved money by it. This union of interest is certainly a step in the right direction, and we hope it will be extended to the purchasing of supplies next season. Too much credit can not be given Mr. Thompson and others in their unselfish interest in this matter.

But to return—there is still a matter of much concern to many of our bee-keepers. This matter has been thoroughly tested in Salt Lake County the past season, by placing colonies of bees in different directions and distances from the smelters, and we find that all bees placed within five miles of the smelters showed a marked diminution in the amount of honey made, and these colonies were off in from three to five months, while many 8 or 9 miles away died during the year. But bees placed within two or three miles of the smelters in the direction that the wind does not blow, do not seem to be affected at all. It has also been proven that much stock and vegetable matter have been destroyed by this smelter-smoke. Arsenic, or something of that nature, settles from the smoke on the trees and plants, causing a destruction of the bees. In the light of these facts some method should be adopted to have this poisonous smoke consumed, or otherwise prevented from being soon broadcast as it now is. E. S. LOVEY.

Mr. Ulrich Bryner, of Carbon Co., said that his bees were in good condition, and had done better this season than ever before. He secured 200 60-pound cans of extracted honey from 85 colonies.

Thos. Nelson, of Sevier Co., reported that the season's crop was considerably below the average.

Mr. Balliston, of Juab Co., reported a fairly good honey-flow in that county, but not as heavy as it had been in some years.

J. A. Smith, of Wasatch Co., reported a fairly good crop in that county, although they had harvested larger crops in other years. Wasatch is one of the counties in which there is a good flow of first-class honey in ordinary seasons. Mr. Smith heartily endorses the efforts of the Association in trying to keep up the work of the Association, thereby aiding the bee-keepers in building up the industry.

Uintah County reported the best honey-flow of the season, and is the banner county of the State. A score or
The mills of the gods grind slowly." It is thus with the Apis dorsata. If you give so much really advocated, I can assure you, however, that this undertaking is certainly making progress; one thing is certain, Providence is on our side, and, altho he has not yet succeeded in importing these bees, he has given us their native soil, and doubtless he has made a very considerable acquaintance to the star-spangled banner. I believe they are willing subjects, as there are no reports of their having joined the insurgents! I trust the opposition will not start such a report, and I do not think, perhaps, killed, or at any rate, without, of our little army, and driven the balance into the China Sea! Yet such a story would be just as reasonable as many that have been circulated in relation to this bee.

That is all in regard to the subject of marketing the surplus, which is quite out of place this season, owing to the fact that we have none to market; but if we should be fortunate enough to secure a crop again we should endeavor to maintain prices now that they have advanced.

The National Association has recently issued a pamphlet, larger and more complete but similar to the one we published over a year and a half ago. Such pamphlets are very useful. I wish that all this matter—showing the relation of bees to horticulture—that has been published by the Department of Agriculture, the various experimental stations, and other recognized authorities, with the experiments now being made at Ithaca and Geneva, in relation to spraying in bloom, and the benefits that could have resulted in one bulletin. This matter of the bee and its importance to agriculture can not be proclaimed too much—the people should be made to realize their obligations to the honey-bee.

I will briefly call your attention to Article 3, Section 2, of the Constitution of the National Bee-keepers' Association, which read as follows:

"Whenever a local bee-keepers' association shall decide to unite with this Association, or any branch thereof, for the purpose of receiving on deposit, or for the purpose of payment by the local secretary of 50 cents per member per annum, provided that the local association's membership dues are at least $1.00."

This is carrying out the ideas embodied in our State organization, and, if adopted by our association, would admit us to membership not only in our county and State associations, but in the National also, and all for the small price of $1.00 per annum. I would recommend that our constitution be amended so as to take advantage of this provision of the National Bee-keepers' Association.

In my several previous messages, with which you have been afflicted, I have by turns coaxed and scolded the bee-keepers of the county for carelessness, or indifference, shown by them for not taking greater interest in these meetings. The fact that you have realized but little from your bees for a couple of seasons should not deter you from aiding and strengthening our organization. Little by little you take it up, and you will see and feel and benefit you will derive from it. Do not wait for the secretary to urge you. Each of you has some subject—perhaps several—relating to our pursuit, upon which you have well-founded ideas. The more the secretaries can get him put you on the program. Take pride in your organization and pride in our pursuit; it may not be the largest industry, but it is just as honorable as any. Bees are said "to have been the heralds of civilization, steadily preceding it as it advanced." That they have always been held in high esteem by man can not be questioned, as they are mentioned as far back as history extends. They figured in the symbolical history of Egypt nearly 4,000 years B.C., showing with their presence that Egypt was inhabited.

Let me repeat, take pride and interest in your pursuit, that the bee may ever remain where history and science place it—the most interesting and important member of the animal kingdom.

---

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard back of the picture. It is the only fine picture that bee keepers ever taken in one picture. It is sent, postpaid, for 87 cents; or we can send the American Bee Journal one year and the picture—both for $1.00. It would be a nice picture to frame, and the not concerned with them, but think there are nearly 200 bee-keepers shown.

---

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for $1.10.
Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, with a request that answers be sent. Please do not ask the Doctor to send answers by mail.—Errors.)

Boiling Foul-Broody Hives—Newly-Hived Swarm Leavino.

1. If I boil hives and frames that have been taken from foul-broody bees, will it kill the germ? and will they be safe to put bees in again?

2. Can one tell whether the disease is foul brood or pickled brood when it is found in an early stage? If so, how?

3. Last season in swarm-ing time it was quite warm, and in hiving bees they would leave the hives soon after being put in. A remedy was tried of cooling the hive with cold water, and after letting it drain put the bees in, but they would leave them. What was tried, and had but little success. The hives were new, and had foundation on each frame. Please suggest a remedy. What do you think was the reason of their deserting?

Answers.—1. Yes, and some good authorities say it is safe to use a hive of the kind without boiling.

2. You can hardly be certain till some advance has been made. It is the subject in the last volume of American Bee Journal.

3. When a swarm is hived and leaves the hive, in a large proportion of cases it is because the hive is too warm. Sometimes wetting with cold water will help, but if the hive stands an amount of heat it may still be hot in spite of the getting, especially if the hive is close. Let the hive be raised from the bottom-board, and perhaps the cover open a little for a day or two. Some give a swarm a frame of brood. Bees are not likely to desert this.

Queen and Swarming Questions.

1. What percentage of queens reared by a strong colony, and then 3 days before hatching being given to nuclei, would swarm the same year?

2. What percentage of virgin queens would swarm, if allowed to hatch before being introduced to nuclei?

3. Would it be better to let each nucleus have its own queen, providing each had 4 or 5 frames of sealed brood with one containing some eggs, and all being well covered with bees?

4. What would be the best method to increase from 30 to 55 colonies and keep swarming down?

5. Would it make any difference in the harvest if all old queens were replaced by virgin queens 45 days before the flow? or would it be better to give them fertile queens of this year's rearing, and what difference would it make in swarming?

Answers.—1. I don't know. If you will tell me what will be done with the queens afterward, I may be able to tell something about it. Your question is such as to suggest that you suppose a queen reared in a strong colony and given to a nucleus three days before hatching will give results as to swarming quite different from one that has not been given to a nucleus. I doubt that. It is not so much what has been done before the queen begins laying, as it is what has been done after.

Let me try to answer fully the spirit of your question, for there are some misconceptions likely to be entertained in the minds of beginners. It is a commonly believed opinion that a queen of the current year's rearing is not so likely to swarm as an older queen. The belief is right. And it is strong. It all depends. For a fact, it is a sure thing that a queen would not swarm before six months of age. At that time it was probably correct. Lately the opinion is held that a young black queen of the current year will not swarm, but an Italian queen may. There may be some difference between blacks and Italians in this respect, but I'm a little skeptical as to its making much difference. I think the rule was true of blacks before Italians were introduced—not because they were blacks, but because of the early age at which they would have swarmed. Before the introduction of Italians, there was little in the way of changing queens, making swarms by dividing, etc. Bees were left pretty much to their own devices. Leave them to their own devices today, and you may count that a young queen of the current year's rearing will not swarm till the next season, whether black or yellow. In other words, if a young queen is reared in a colony in the neighborhood of the swarming season, and left in that colony, she is likely to be queen and the swarm that season. I'm not so sure that any satisfactory reason can be given, but the fact seems to be well established.

If a queen is reared this season, and after being reared is put in a hive where conditions are favorable for swarm- ing, there will be no objection to the swarm. Let a colony be on the point of swarming, or take it immediately after it has swarmed and the swarm has returned; take its queen from it, and give it another queen, and that colony will likely make the next month's or month's and a half's repulsion. If a colony swarms and return (the queen was elipt), and I took away their queen, giving in its place a young queen that had not been laying more than two or three days. Promptly that swarm came out with the young queen not more than two days later—I think it was the next day.

If a queen is so old as to require superseding, and that supersede occurs about swarming-time under prosperous conditions, there is likely to be swarming, whereas there might have been no swarming if a young queen had been present that did not require superseding

I haven't given you, perhaps, a satisfactory answer, but it's the best I can do.

2. Probably just the same as if they had been put in the nuclei before being hived.

3. Four or five frames of brood well covered with bees would be rather a colony than a nucleus. A queen reared therein might be a very good queen, supposing, of course, that she was well reared and placed before, and such a nucleus queens would hardly be advisable if many were to be reared, because too expensive. A number of bees may be reared in one colony just as well as to let the colony rear a single cell, and when the cell is near hatching it may just as well be in a nucleus till the queen lays.

You would probably find Doolittle's queen-rearing book a profitable investment.

4. What would be best for one might not be best for another. For some, natural swarming would be best, preventing second swarms by hiving the swarm on the old stand with old colony close beside it, and removing the old colony to a new location a week later. For some the nucleus plan would be best. Studying conditions and hives from time to time give to each nucleus a frame of brood with adhering bees, or brood only, planning to give just enough help to build each nucleus up to good strength for winter.

5. It would probably make a big difference to give a virgin queen 45 days before the flow—so great a difference that you would not be likely to try it a second time. The harvest with you is likely to begin somewhere about June 10; want 5 days before that time would be in the latter part of April. As far north as northern Illinois you will hardly succeed in rearing good queens by that time. That is objection enough of itself. To put a virgin queen in a colony which will be in its 25th week in 2 months time is important to have it push to the ability of the colony. That is also a sufficient reason of itself. Neither would it be wise to think of giving a young laying queen in April. It would make chances for swarming somewhat less, but not enough less to overbalance the disadvantage.

Out-Apairy and Swarming—Feeding for Winter.

1. How could an out-apairy be managed where daily attention could not be given to it, mainly the swarming question, possibly 25 or 30 colonies, in a fine honey locality? Would the bee-entrance guard on each hive prevent swarming? What would be the result if they did swarm, and were allowed to get away as long as the bees had before the entrance guard was put in?

2. What would be a fair share (of honey) to give to a person for allowing me to place 10 or 12 colonies on his farm, everything to be furnished by me, he only to see to the shade-boards, etc., as he does not understand hiving swarms or bees at all?

3. What is the best time for feeding sugar syrup, for...
winter use? and how can you feed thru the winter in case of necessity? Some time since one colony starved to death for lack of food, not knowing how to feed syrup, but inasmuch as it is super with comb honey on the hive, it seemed to do no good. They were on the summer stands.

4. Can you name one or two good feeders, and tell how to use them?

5. Can extracting be done thru the winter as well as in the warm weather? Using frames for extracting, would medium (full sheets) brood foundations be right? and should they be wired in?

In my short experience I have found that the bees in hives not shaded, begin work earlier, and also they work later than those that are shaded.

WASHINGTON BEGINNER.

Answers.—1. Bee entrance guards would not in the least prevent swarming. It only prevents the queen from going with the swarm, and without a queen they would not leave. It would be just as well for them to swarm and be lost as long as the remainder did well,” but unfortunately the remainder will not do as well. Entrance guards might be safely used if you could visit the place as often as once a week, for the queens would be held in the traps awaiting over. If the feeding is done early enough, I prefer to have such large hives with so much room in the extracting-supers that the amount of swarming need not be considered.

2. That question is not easily answered, but at a guess it might do to give him honey enough for use on his own table. The amount of compensation would not be exactly in proportion to the number of colonies. A man would just about as soon have 10 colonies sitting on his ground as one. In some cases a man might be willing to pay for having bees on his place for the sake of having his fruit fertilized.

3. Just as soon as you are satisfied no more surplus will be stored. In some places—in a good many places—that might be in the last of August. That gives time to have the syrup well ripened and put in proper shape for winter. In any case, try to have all feeding done before September closes.

In case of necessity in winter, use comb honey or sugar candy, making sure that the food is so close to the bees that they will crawl directly upon it. Don’t think of feeding syrup in winter.

4. Root’s A B C of Bee-Culture gives the Miller feeder first place if the feeding is to be done on top. Put the feeder on top the same as a super: put in syrup and cover over. If the feeding is done early enough, I prefer a plan that is still less trouble. Put dry granulated sugar in the feeder, and then pour hot or cold water on it. The bees will do the rest. If you prefer to feed at the hive-entrance, the Boardman feeder is one of the best.

5. It is just as easy to extract in winter as in summer, if the combs are just as warm. If kept in a very warm room for 24 hours, you will likely be able to extract. If you can hang them overhead in the kitchen they will stand a good chance for heat.

The American Bee Journal

OCTOBER

The Afterthought.

The “Old Reliable” seen thru New and Unreliable Glasses.

By E. H. Hasty, Richards, Ohio.

WEIGHT OF NATURAL COMB.

Average weight of natural comb 10 grains to the square inch. Prof. Gillette, page 23. If we call the Langstroth frame 144 inches (usually less from being nibbled away at the bottom) the weight of the wax in a comb will be 1,440 grains, or 14,400 grains in a 10-frame hive. Now, if we assume that the 400 grains will cover the extraneous matter work into the new comb of a hive, we have just an even two pounds of actual wax. Practically, I think they usually work in a good deal more extraneous matter than that, but on the other hand, next to the bars all around there is much more wax than 10 grains to the inch. So a fair estimate of the actual weight in a hive, providing it all could be recovered, is two pounds for 10-frame hives, and one pound 9½ ounces, nearly, for the more common 8-frame hives.

MAKING ROOM FOR WAY-SCALES.

And so D. H. Coggshall thinks that it pays to cut off pieces from the comb to fill space—time. Bees place to use their scales of wax without building burns. I think he has a valuable idea—that is, valuable in long, strong runs of honey. When the combs are scant thickness, or not built down at the bottom, or when the comb is short, then the cutting would be rather a waste. Page 24.

FANNING AT THE HIVE-ENTRANCE.

I think Dr. Miller, on page 25, does a pretty good job at theorizing. A bee không can almost always take permission by the guards at a hive-entrance falls to fanning at once—plain way of saying, “Don’t you see, I am ready to go to work? and robbers do not work.” Guess it’s right. Still, let a fourth swarm come along, and the bees will have nearly empty and pretty well demoralized as to guards; let the swarm hang an hour till said hive gets cold—cooler than it needs to be; then hive the swarm and carry it away, leaving say 50 obstinate bees determined not to leave the limb. In the course of the day it will dawn upon them what fools they are, and they will return to the alighting-board. I should expect to see them fanning together there first thing they do. In this case there can hardly be fear, or uncertainty, and there is no need of the fanning being done; what is it? Fanning in the entrance draws outside the familiar smell of home. Perhaps that is what they want—before they have submitted to the inevitable quite enough to go in.

DOUBLE WALLS AND CHAFF ON A HOT DAY.

Mr. J. M. Rankin has got on track of a question that is of value—the actual effect of double walls and chaff on a hot day as compared with plain, single-walled hives. Thinks the working-force for a time mostly abandoned the supers of the single-walled hives. This is one of the things we want to be sure of before we are too sure of it, so repeated observations by different observers are desirable. For future comparisons Mr. R. should have given us the temperature in the shade in addition to that in the sun. Page 39.

COMB BUILT BETWEEN FINISH COMBS.

Dr. Miller is right in his answer to “South Carolina,” on page 43, that a comb built between two finish combs in a super is apt to be very thin. Even if so much extra space is given as to obviate that trouble the alternation doesn’t seem to be a good plan. Put in the first-rate, finish comb next one side of the super, then several frames with starters, then one or more partly built combs if you have them as I mostly do; then fill the rest of the super with finish combs. That seems to be the “how” to do it, providing you don’t want the bother of having them.

QUEENIE JEANETTE is the title of a pretty song in sheet-music style, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.
Feeding Bees for Winter.

Our bees went into winter quarters in debt to us. We had to feed about two-thirds of the colonies late in the fall, and unite many weak ones. If we had not fed they would have had very little honey to winter on. A friend about 30 miles from here fed his bees in November to keep them from starving.

We took only about 300 pounds from the colonies. We united some in the fall so now we have only 98, but as their fall honey was gathered from decaying fruits, etc., I fear they will not winter as well as they usually do. I am sure they winter better on sugar syrup if fed early and well sealed, than they will on such honey as they gathered last fall.

It has been so dry for the past few years that many bees in this locality have died. Some years our crop has been cut short by people spraying fruit-trees while in bloom. 

—Mrs. L. C. Antell.

Something About Bumble-Bees.

On page 44 I notice a letter written by S. T. Pettit, in regard to bumble-bees in winter. I presume the majority of people think the wintering of them will be different. I am sure they will go, but I think the queen goes South. My reason for thinking this is that I have never seen a bumble-bee in the spring until the weather become quite warm, and the flowers had begun to bloom. The queen starts her nest and increases very fast. If they stayed here all winter I should think they would come out as soon as the weather began to get warm, as do the honey-bees, green flies, and other insects.

There are three sizes of bumble-bees—queens, workers, and drones. The drones have very long bodies and are

Gleanings in Bee-Culture!

Gleanings for Jan. 1st contains these Special Articles:

Queen-Rearing in France, by — Giraud-Pabou
Candied vs. Bottled Liquid Honey, by Chalon Fowls
Wintering Bees in Clamps, (From Bee-Keepers’ Review) by — W. Z. Hutchinson
Conversations with Doolittle

Mintle’s Lightning Section-Folder
Stray Straws, by Dr. C. C. Miller, Every Issue
Picking Straws from Our Neighboring Fields, by Stenog, Every Issue

Our Honey-Bottling Symposium, Fully Illustrated, by G. A. Deadman, Earl C. Walker, and Walter S. Pouder

The Personnel of the Utter Trial by E. R. Root
The Belgian-Hare Business, by W. K. Morrison, of Devonshire, Bermuda

Six months, beginning Jan. 1st. Feb. 15th will close subscription for the year.

Cuba by The American Tramp

Mr. Howe was formerly with Coggshall, of New York, and has already given Gleanings readers glimpses of Cuban bee-keeping. Mr. Luces, of Puerto Principe, considers that conditions are not well known and gives information somewhat different from other writers. Mr. Boyley begins a series of articles entitled, “Glimpses of Cuba and Cuban Bee-Keeping.” Illustrated by photos taken by himself.

SPECIAL OFFER.—Each one of the issues mentioned above should be worth a dime to every bee-keeper, but we will send all three for only 10 cents. Hurry along your order before they are all gone.

BETTER YET—Send us 25 cents at once, and we will send you Gleanings in Bee-Culture issues, 6 months, beginning Jan. 1st. Feb. 15th will close subscription for the year.

Remember, Six months for 25 cents, and your money refunded July 1st if you are not satisfied. Mention the American Bee Journal.

THE A. T. ROOT COMPANY, Medina, Ohio.
quite yellow, being market better than most of the Italians in this country. The workers are smaller and darker, and are great lighters: I don't know whether the queens fight or not, but I think they do. The whole colony works for a living—the drones also. I don't know that they carry in any stores, but I have seen them working on thistles. Like the honey-bee drones they have no stings. I have heard of hives coming from one of them, and sucking the honey out of them, but I have never tried it.

Twice in my life I have found a single bumble-bee three or four inches across. I had one last year, and when building up until fall, just as the bumblebees do, then they all die or disappear.

The past season was the poorest we have had in 30 years. I have been in the bee business nearly that length of time, but have never seen anything like it. There was a pretty fair growth of white clover but it secreted no nectar. I have never had so much surplus honey gathered in this neighborhood. We have had no honey worth mentioning in the last four years, but we still have hopes, tho it seems a long time coming.

THOMAS WALLACE.

Poor Prospects for Next Season.

The prospects for a good honey season in this locality are away below par again, I am sorry to say. We have had only two fairly good rains thus far this winter, and there is a deficiency of over two inches of normal precipitation, which means a good deal in this land of "excess of sunshine".

Since reading of the Bee Journal's loss by fire I take pleasure in forwarding my dollar for renewal subscription, and hope all bee-keepers will be prompt in coming to the assistance of the journal which is devoted solely to their interests. The three successive poor honey seasons here have made it seem best for me to drop three other bee-papers, but I must retain at least one to keep in touch with the bee-keeping world.

F. C. WIGGINS.

Handled Bees 50 Years—Rearing Queens.

I am 62 years of age and have handled bees for the past 50 years. I lived in Rhode Island 30 years ago, and then I came to Florida. I commenced using the Langstroth hives and frames in 1865. In 1867 I bought 10 colonies of Italian bees from the imported queens. During the past two years I have introduced about 400 queens very successfully. For the 10 years that I have kept bees in Florida I have averaged 150 pounds of honey per colony, and increase from 12 to 40 colonies.

My bees do not always behave as nicely as the bees belonging to some
Buggy Announcement Extraordinary.
The Kalamazoo Carriage and Harness Co., of Kalamazoo, Michigan, have adopted the plan of sending their vehicles anywhere, on 10 days free trial.

They sell direct to consignees at wholesale prices, and allow you to take the vehicle from the depot, hitch up to it, try the springs, running qualities, see the trimming, finish and style before you decide to keep it. No more buying "a cat in the bag, sight unseen." They know the quality of their goods and are willing to let them sell on their merits. Write for free catalogue.

KALAMAZOO CARRIAGE AND HARNESS CO.,
Box 53, Kalamazoo, Michigan.

Maule's (35 new things for 1901)
Seed Catalogue

You should, by all means, have this most modern catalogue of modern times. It is brimming over with good things in vegetable, farm and flower seeds. Flowering plants, fruits, nuts, etc. It contains 35 novelties in vegetables and flowers never offered before, has 18 large pages, seven handsomely colored plates and hundreds of illustrations. It gives practical, up-to-date cultural directions and cites many cash prices.
The first edition alone costs over $10,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which amount they may deduct from their first order. You will make a mistake if you do not write to-day for this the Novelties seed book of the year.

HONEY AND BEESWAX

MARKET QUOTATIONS

CHICAGO, Jan. 19.—Honey is selling slowly; this season's crop is about half that of last year. White clover and basswood comb honey, which sells readily, has provided the most grades No. 1 or better. All other kinds of white comb honey sell at from 14c to $1, and candied white comb at from 10c to $1 per pound. Grades of comb, 13c; amber, 12c; amber extracted, 7c; and cuckoo, 6c.

W. R. CROMWELL PRODUCE CO.,
Successors to C. C. Clemmons & Co.

BUFFALO, Jan. 17.—All kinds of honey are so quiet and in demand that the dealers will not take anything but choice samples, fancy 16c; few, 16c; choice No. 1, 12c; few, 14c; but dark, 10c, and all kinds in liberal supply; some may have to be reclassified. Extracted, 78c, and not wanted in Buffalo. Beeswax, 22c.

BATTRESSON & CO.

ALBANY, N. Y., Jan. 18.—Honey market is dull on all grades now, with light stock and light demand. We have from 2 to 12c, not candied, 15c; mixed, 18c; buckwheat, 12c; maple, 12c; and extracted, white, 80c; mixed, 60c, dark, 55c.

H. R. WRIGHT.

BOSTON, Feb. 8.—Fancy No. 1 white in cartons, 15c; No. 2, mixed, 10c; No. 3, dark, 5c; and No. 4, dark, 2c. Generally good fair. Absolutely no call for dark honey this year. Extracted, white, 80c; light amber, 70c.

BLAKE, SCOTT & LEE.

CINCINNATI, Jan. 16.—Market very quiet. No change in prices. Fancy No. 1, mixed, 10c; No. 2, mixed, 5c; No. 3, dark, 1c; and No. 4, dark, 1c. Extracted, dark, sells for 55c, and better grades are from 65c up to $1. The market thus far would bring from 85c to $1.

C. H. W. WEBER.

NEW YORK, Dec. 22.—Fancy white, 15c; No. 1 white, 14c; No. 2 white, 12c; amber, 1c; buckwheat, 10c. Extracted in fairly good demand at 75c for white, and 7c for amber, very good grades. We are importing dark honey from 65c to $1 per pound, according to quality. Not much demand for extracted buckwheat as yet. We are selling amber from 4c to 10c per pound, and have amber, buckwheat, and dark grades. Sells about 10c.

W. E. HILDEBRAND.

SAN FRANCISCO, Jan. 9.—White comb 13c; amber, 11c; extracted, white, 75c; light amber, 70c; extracted, amber, 55c; and extracted, white, 65c. Beeswax, 22c.

R. H. CAMPBELL.

BEESWAX MARKET.

We may have a customer within a short time who wants your honey or beeswax. We are in close touch with all the markets, therefore give us all your prices regarding your crop, stating quantity, quality, and selling price, and we will sell for you.

The Bee-Keeper’s Guide

Or, Manual of the Apiary,

BY PROF. A. J. COOK

460 Pages—16th (1899) Edition—18th Thousand—$1.25 postpaid

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER’S GUIDE.

This 18th and latest edition of Prof. Cook’s magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to present subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal with $2.00, and we will mail you a copy of Prof. Cook’s book FREE as a premium. Prof. Cook’s book alone sent for $1.25, or we club it with the Bee Journal for a year—both for only $1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
144 & 146 Erie St., Chicago, Ill.

THE BEST WHITE
ALFALFA
Extracted Honey

BASSWOOD

All in 60-pound tin cans.

ALFALFA HONEY

This is the famous white
Extracted Honey gathered in the
great Alfalfa regions of the
Central West. It is a splendid
honey, and nearly everybody who cares to eat
honey at all can’t get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known
light-colored honey gathered from the rich, nectar-laden
basswood blossoms in Wis-
consin. It has a stronger
flavor than Alfalfa, and is
preferred by those who like a
distinct flavor in their honey.

We have a good stock of the fine WHITE ALFALFA and
WHITE BASSWOOD EXTRACTED HONEY that we can ship by
return freight. Most bee-keepers must have sold all their last year’s
crop long before now, and will be ready to get more with which to
supply their customers. All who have had any acquaintance with
the above-named honeys know how good they are. Why not order
at once, and keep your trade supplied?

Prices of Either Alfalfa or Basswood Honey:

For the purpose of selling again.

A sample of either, by mail, 8 cents; samples of both, 15 cents—
to pay for package and postage. By freight—one 60-pound can, 9½
cents per pound; two cans, 9 cents per pound; four or more cans,
8½ cents per pound. Cash must accompany each order. If ordering
two or more cans you have half of each kind of honey, if you so
desire. The cans are boxy. This is all.

Absolutely Pure Bees’ Honey,

The finest of their kinds produced in this country.

Read Dr. Miller’s Testimony on Alfalfa Honey:

I’ve just sampled the honey you sent, and it’s prime. Thank you. I feel that
I’m something of a bee-keeper. I sell several thousand pounds of honey of my own pro-
duction and then buy honey of you for my own use. But however loyal you ought to be
to the honey of his own region, there’s no denying the fact that for use in any
kind of hot drink, where one prefers the more wholesome honey to sugar, the very
excellent quality of alfalfa honey I have received from you is better suited than the
honey of most market flavor, according to my taste. C. C. MILLER,
McHenry Co., III.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce
enough honey for their home demand this year, just order some of
the above, and sell it. And others, who want to earn some money,
can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

26 cents Cash paid for Beeswax. This is a good time to send in your Bees-
wax. We are paying 26 cents for a pound—CASH—for best yellow,
upon its receipt, or 28 cents in trade. Impure wax not taken at any price.
Address as follows, very plainly,
GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.
Editorial.

Slow Cooling of Beeswax and its effect upon color has attention again in the Beekeepers’ Review. Editor Hutchinson says:

The American Bee Journal admits that the slow cooling is the only way to avoid the dirt, and that the wax simply allows the dirt to settle and that is the only way that slow cooling can have any effect upon the color. But it still clings to the idea that the dirt or color of wax comes from its impurities. Here is where our old friend is making its mistake. The color is in the wax itself. Dark wax will remain dark, no matter how slowly it is cooled; yellow wax will be yellow altho so full of dirt that the wax could be seen. Any one who cares enough about this can easily satisfy himself:

Let him get a cake of dark, black wax, melt it and keep it a vessel until with some sugar dissolved in water, so as to confine the heat, and cause it to cool very slowly. When cool it may have a clean label of dirt having settled to the bottom, but it will be dark. If you doubt this, try it yourself.

Next, take a cake of the brightest yellow wax, melt it and stir into it a lot of the refuse, or slumgum, or dirt, scraped from the bottoms of other cakes of wax: mix these in well, then cool it just as slowly as you possibly can. The wax will still be yellow, but full of foreign matter. Again I say, if you doubt this, try the experiment.

All of which goes to show that there is no particle of difference in actual belief on either side. Our good friend of the Review wants us to say that different samples of beeswax have different colors independently of the amount or kind of dirt in them, so that there may be a very dark color in wax that does not come from impurities. If Mr. Hutchinson will turn back to the first number of this journal for this year, he will find on page 4 this sentence: "There is no desire whatever to deny that two specimens of wax entirely free from impurities may be very different in color." If he had kept in mind that sentence, he would hardly have said, "But it still clings to the idea that the dark color of wax comes from its impurities." For that conveys the idea that all dark color comes from impurities. There is no real difference as to belief at that point.

Let us get right down to where the point of divergence comes. Take Mr. Hutchinson’s last illustration—some bright yellow wax melted with a lot of dirt stirred in and suddenly cooled. To make the illustration clearer, suppose a lot of lampblack stirred into the wax. We both believe exactly the same thing about it. We both believe that the wax that is in the cake, separated from the foreign particles, is bright yellow, and that all the no yellow color appears to the eye, the black color is entirely due to the lampblack that is there. Then ask, "What is the color of that cake of wax?" he says, "Yellow;" we say, "Black." Of course, he may say that it isn’t the wax that is black, but the lampblack. But we believe our answer is more in accordance with the every-day talk of people. Put the cake of wax before a witness in court and ask him its color. He looks at it on the outside, and then breaks it in two, and he testifies that it is black outside and in. Take this handkerchief and rub soot all over it. Mr. Hutchinson would say, "The handkerchief is white. The soot only is black." Common people would say, "The handkerchief is black.

If Mr. Hutchinson should contract for a lot of bright yellow wax, and when it arrived be found it one-fourth dirt, he would hardly feel satisfied if the consignor should say, "That’s bright yellow wax, just what I contracted to send you;" neither will he be satisfied if he is told that a fourth will be deducted for the weight of the dirt.

Referring to the issue of this journal for Jan 17th, the American Beekeeper says:

Editor York now asserts that his journal has never pretended to claim for slow cooling anything more than that it allowed the foreign particles time to settle.

We do not believe that Editor Hill is a man who would intentionally misrepresent, but that statement, so far as we can understand it, might be understood to mean that some change had been wrought in the views or the statements of this journal. So far from being the case, it is true that precisely the same assertion was distinctly made in this journal the first time any editorial belief on the subject was given, as Editor Hill will see if he turns to the issue for Nov 16th, 1901.

Mr. Hill then asks, "Why, then, has the Journal so emphatically opposed our assertion that slow cooling has nothing to do with rendering dark wax a bright yellow?" Simply because the assertion is not believed to be true.

Let us see if we can express, in as few words as may be, just what we do believe. The most of the wax in this country is of a bright yellow if properly cleansed, but when rapidly cooled, as is likely to be the case with the inexperienced, it has mixt in it more or less foreign particles that give it a dull or dirty color. If allowed a long time in cooling, it will become clean, just as that is, state suitable for the settling of the foreign particles, and thus the dirty-looking wax will become bright yellow.

A Michigan Foote Brood Law. Another attempt is now being made in the Michigan legislature to secure the passage of a law providing for the appointment of a bee-inspector for that State. Editor Hutchinson, in the January Beekeepers’ Review, had this to say in 1887:

Once more have the beekeepers of Michigan, in convention assembled, appointed a committee to labor for the passage of a needed bee law, a law that will empower the governor to appoint an inspector who has been recommended by the State Beekeepers’ association, and who will have authority to destroy foul-broody colonies when the owner can not or will not properly treat them. There is also to be renumeration for colonies that are destroyed, the same as the owners of cattle diseased with tuberculosis are reimbursed for their property when it is destroyed for the general good. A resolution was also unanimously carried recommending the passage of the law, and this resolution will be read before both houses of the legislature.

There was an attempt, two years ago, to pass a similar law, but it failed, principally because of the apathy of beekeepers. No one informed that only 30 letters were received by members asking them to vote for the measure. The present introduduction will not secure its passage; the members must be urged to vote for it, and good reasons must be given, showing why the measure is needed. It must be remembered that the majority of people know very little about bees or beekeeping, and the members of the legislature must have explained to them the contagious character of foul brood, how it spreads from hive to hive, and from apiary to apiary, and from county to county, and that it is impossible to prevent this spreading until there is some authority to destroy careless, ignorant or willful beekeepers to rid them of apriaries of the disease.

Members should also have their attention called to the value of the bees to the fruit grower and horticulturist by their work in fertilizing the blossoms. The loss to the country from this source should be greater than the loss to beekeepers. If beekeepers will only wake up and do their duty in this matter, the bill can be past. There are hundreds of beekeepers in this State, and yet only 20 of them had sufficient interest in this matter to write to their representatives and ask him to vote for this measure, giving the reasons why the law is needed. If there is no foul brood in your county, it may be in your neighborhood, nearer than you think. You little know how soon you may need help.

In order that the beekeepers of Michigan, who should be more interested in this matter, may know who are the members of their State legislature, we append a list herewith. When writing your senators and congressmen, "Senate Chamber, Lansing, Mich.;" address your representative, "Representative Hall, Lansing, Mich.;" Do this at once, and besides giving reasons why the law should be past, let him know that you fully expect him to use his influence and vote in favor of it.

NOTES ON THE WISCONSIN CONVENTION.
As we promised last week, we will now endeavor to jot down a few noteworthy events of the recent annual convention of Wisconsin beekeepers, which was held at Madison, Tuesday and Wednesday, Feb. 5th and 6th.

By previous arrangement, at 3 o'clock Monday afternoon, Editors E. B. Root and W. Z. Hutchinson, with the writer, met and boarded the Chicago Express at Milwaukee & St. Paul train at the Union Depot here, and started for Wisconsin's fair capital, we arrived about 1 p.m., and "put up" at the ’Simons' House.' Here is where the beekeepers and other devotees of rural industries usually stop. And the boarding is good; but the sleeping—well, we have seen doziers and sweeter resting-places.

Mr. N. E. France, the energetic and enthusiastic president of the Wisconsin Association, was the first of the clan to meet us in the hotel. He had reserved for the 'three editorial boys' a room with two beds. But it was too late for supper at the hotel, so we had to look up a restaurant, and were directed to one which seemed to be patronized by State senators (the legislature being in session), so at least two-thirds of the editors were satisfied. But from 9 to 10, we staved, the journalistic trio returned to the hotel, where Editor Root began a lengthy nocturnal conversation with Mr. France in the waiting-room, while Mr. Hutchinson and this little editor went to their third-story room and retired, each taking a bed, and remarking that when Mr. Root came up we would see which one had the mitten (that time) if never before in his life. It's an advantage to be small in size sometimes.

As we expect to publish a report of the convention—especially the excellent papers read—we will not dwell very much here on the meeting. We do want to say, however, that Mr. France is a splendid presiding officer of a beekeepers' convention. He keeps things going, and in a very interesting way. As A. I. Root was recently called the 'Pooch' of American beekeepers, Mr. France well deserves to be called the "Pooch of Wisconsin beekeepers."

The first, or Tuesday, evening was devoted to a stereopticon lecture by Editors Root and Hutchinson, one manipulating the slides while the other explained the pictures. This was a most successful effort, and one which was thoroughly enjoyed by all present.

Editor Hutchinson had previously planned for the taking of a photograph of the "editorial triplets," so on Wednesday morning we three called on one of Madison's best "photogs," and engaged him to do the job. As each of us had on a queen-bee button, he 'caught on,' and insisted in calling Mr. Hutchinson the 'king-bee,' presumably on account of his (Mr. H.'s) height and dignified appearance. We understood afterward that we were also taken for three senators (both) by the lady clerk who entered the order for the sitting. (We all survived, however.)

At 1:15, on Wednesday, Mr. Root and the writer decided to take the train for Watertown, and call on the G. B. Lewis Co. Mr. Hutchinson was to follow on a later train, by another route. We had our first taste of the hotel, and gave us a cordial reception, and showed us all over their great factory, where hives, sections, basket boxes, etc., are turned out in any quantity desired. It was both surprising and interesting to see how rapidly the basket boxes are made by machinery in the hands of bustling boys.

About an hour before leaving, Mr. Lewis ordered a two-seated sleigh and a pair of high-stepping black horses, with sleigh bells on all four, and gave us a ride in the breathing air of Watertown.

We saw pretty much the whole town, which covers nine square miles, and has a population of about 10,000 people. It is a delightful place, and if Mr. Lewis is a sample of its inhabitants, it is all right.

Just before taking the sleigh ride, we called on the firm of woodland & Stone. They are large manufacturing concern, and have employing from 30 to 50 hands, many of them being girls. They use a great deal of honey in their enormous business, and prefer Wisconsin honey. They list over a dozen things in which they use honey, viz.

(Cuban wafers, honey-bar (feed), honey-cake (feed or plain), honey custard cake (feed), honey pie (rifle), honey confectioners' (feed), honey gels (feed or plain), honey coconut fingers (feed), honey gels (feed or plain), honey coconut gum (feed or plain), and honey coconut jumbles (feed).)

We had the pleasure of meeting Mr. Stone, who was enthusiastic over the use of honey in the preparation of good things to eat that are baked. He is an earnest advocate of pure honey, and will have no adulteration. He knows of no other sweet that can possibly take the place of honey when it comes to keeping a cake or coco-y moist and good for a long time.

No. 4.—Extracted Honey Production.

Can not Produce Both Combed and Extracted from Same Colonies—Limited Swarming Best—About Equipment—How to Make a Strainer,

BY R. C. AIKIN.

It is practically out of the question to produce both comb and extracted honey from the same colony. I know, by experience, that it is not practicable to do it, both in an average field and in the hands of an average apiarist, it can not be made a success. Some of the things necessary to get both and be a success, would be a sure and positive flow, lasting long enough and of sufficient quantity to fill the sections put on. A flow giving two or more supers, may be taken in part in each by allowing the sections to be well nigh completed before adding the extracting-supers, or by lifting the latter and giving sections under it. But the job is beset with so many difficulties, I would say let none but experts undertake it, I will give up trying to tell how to do it.

I have already told you something about size of hives and their manipulation in building up colonies before the flow, and also somewhat about control of swarming. I will repeat, if you want best work and most honey obtainable where flows are somewhat uncertain and of short duration, the less swarming the better. This applies more fully to summer flows—a fall flow is different because one has all summer to build up, and may be able to double, treble, or quadruple, the number of colonies and still have good working ones.

There are other things besides bees and hives needed in producing extracted honey. A honey-house becomes a necessity, even when the apiary is very small. If one has only a half-dozen colonies or so, a small room or tent may be used in lieu of a honey-house specially built for the business, particularly when comb or section honey is produced; but when extracting and producing from 15 or more colonies, a room should be eqiupd for this alone. Extracted honey production needs a larger equipment of tools and appliances than does comb, and needs more care and labor in getting it into proper shape for market. So far as the handling of the two products (comb and extracted) is concerned, there is more labor in the extracted, but in the preliminary work or management of the bees the comb takes both greater skill as an apiarist, and more labor. But I am not discussing the comparison of the two, hence will continue my subject.

Of course you want an extractor. As to whether a 2 or 4 frame machine, I think there is no very great economy in using the larger. I have used for many years a 2-frame machine, and now have a 4-frame one. I do not think I would go back to the 2-frame one; I consider the 4-frame size enough better—especially for extensive producers—to justify its use. If crank help is not convenient and cheap, the larger machine has the advantage. I would also use a reversible extractor.

The extractor should be set solid that it may not shake.

Uncapping and Extracting Honey.
It should also be conveniently arranged to get combs into and out of, having the uncap combs where the crank-man can reach them easily. I have my uncapping arrangements to the right of the extractor, and just far enough away that there is room between it and the box that receives the cappings to have a rack or hive to receive the uncap combs. I herewith present photographs of these fixtures as I have them set in my honey-house. The combs to be uncap are to the right of the knife-pan, and when uncap are past to the left to a receiving rack right close to the crank. This rack does not appear in the picture because it is down behind the capping-box. Immediately to the right of the capping-box and hanging on or attached to it, is a small trough-like vessel containing water in which the knife lies when not in use. A small oil-stove keeps the water hot. A hot, wet knife cuts better than a cold, dry one.

The bottom of the capping-box is prepared with an incline to one point where is an outlet, and above this is a false or secondary bottom made of wire-cloth of 4 or 5 meshes to the inch, galvanized wire just like the extractor screens. The cappings drop upon this screen and drain thru to the outlet and the honey passes off at once. Just beneath the uncapping-box, and extending from under it to the left clear to the extractor, is my strainer-box. This is made of lumber about a foot wide, using 4 pieces, two of them 6 feet long and the other two about 20 inches. The short pieces or ends are gained into the sides about 1 1/2 inches from the end, the gains about 3/4-inch deep and about 1 1/2 inch narrower than the thickness of the end pieces that are to go into them. The ends of the side boards are then beveled down this 1/2, so that when the box is put together, and driven and thoroly nailed, the joint becomes flush inside and outside. A caution may be taken by putting white lead or linseed oil in the groove or gain before putting together; this makes a closer joint and prevents decay.

The bottom of this box is made of galvanized iron or of tin. The box can be made any size desired—I have made two or three of different sizes, usually the width to correspond to the width of the tin or iron that is to make the bottom, and as long as desired. The metal for the bottom should be enough larger than the outside measure of the box, so that it will project beyond the wood 1/4 to 3/16 inch, this projection to be turned up and pounded snug up against the lumber, after the iron is nailed on. The metal is laid on the box and nailed with flathead 1-inch or 3-penny fine nails, driving them about every inch. Do not drive the nails in a straight row, but zigzag them or alternate, one near the outer side of the board, and the next near the inner side, just so there is no danger of missing the wood.

After it is nailed, take a strip of about 3/4 or one inch thick—you can make these by ripping out from the edge of a board. Nail this strip over the metal bottom clear around, using about 6 or 8 penny nails and driving right thru the metal into the edge of the wood. The side springs in as the bottom sagged. After these strips are nailed—on the box being mouth down, of course, while you are doing the nailing—you really have a little box just the depth of the thickness of these strips. Now cut one, two, or three strips as long as the inside width of the box, and 1 1/2 or 2 inches wide, and the same thickness of the strips nailed around. These strips are to be just long enough to drop in lightly across the bottom between the strips, and nailed thru the rims into their ends, nailing from the outside. These cross strips put in tight give the bottom a strong tension and prevent any sag. The rim and strips also support the bottom just their thickness from whatever set upon, and shield the tin or iron from being dented or bruised from any hard substance beneath.

This strainer-box also has a sub or false bottom made this way: A wooden rim or frame is made of strips about 1 inch by 1 1/2, and one or more strips of the same size and length as the ends put across spaced equidistant from the ends. Upon this frame is nailed a sheet of galvanized wire-cloth such as is used in the extractor-baskets. This screen is then placed in the box, being in its outside measure just scant the inside of the box, and rests on little cleats nailed to the sides of the box 2 or 3 inches above the bottom. On this false bottom or screen, spread a piece of cheese-cloth that is big enough to cover the whole top of the screen and reach up and lap or hang over edges and ends a little, and you have a very good and complete strainer. When the cloth becomes clogged, remove and wash it.

Larimer Co., Colo.

Bee-Keepers and Bee-Supply Dealers.

An Inquiry Into a Matter of Equity, in the Court of Public Opinion.

BY "COLORADO."

I WILL restate the proposition because I failed to convey the exact point to the dealers in my first letter, on page 69. At any rate they did not get my idea fully.

THE QUESTION.

The excellent and only safe rule of buying bee-supplies for cash enclosed with order affords unequal measure of protection, of justice, of equity, to the two parties to the trade transaction. The rule makes the seller absolutely safe, but leaves the buyer to carry numerous risks risk of error in count, risk of unsafe packing, risk of error in cutting, risk of destruction en route, risk of misreading or misapprehending the order, and other risks. Can one of both sides buyers devise a rule that will be equally fair, and equally protective to both parties?

THE ARGUMENT.

I am not prepared to offer a substitute. But I am studying the question.

Dadant says no rule can be laid down. I fear this is true, but this view is not creditable to the writer. Most of the dealers drop into a discussion of giving credit to buyers. To this extent they misapprehend the point of my query. Plainly, there should be no credit. The only rule to right prices is the cash rule.

I do not ask you, Mr. Manufacturer, or Mr. Dealer, to surrender an ounce of the protection that you have, But I want an equal share with you.

If the buyer pays his cash weeks before he gets his goods, the rule is not a spot-cash method for the buyer.

Experience has taught me something about writing orders. If I instruct the dealer to fill my order within a certain time, or else return the inclosed remittance, I invariably get prompt attention. Otherwise I may wait indefinitely, altho the dealer may have my cash. We buyers often fail to state our wants clearly.

Commercial honesty—I mean the ethical code governing business men—is superior to individual honesty. I
Do Bees Puncture Fruit? Not Their Nature.

BY PROF. A. J. COOK.

I have received from Hon. Eugene Secor, general manager of the National Bee-keepers’ Association, the following interesting correspondence:

PROF. A. J. COOK—

Dear Sir: I send you a copy of a letter received from Prof. Slingerland, of Cornell University, New York. I would like to know how you coincide with the opinion of his senior professor regarding the structure of the bee’s mouth. I have been led to think differently. I had been intending to send Prof. Slingerland as an expert witness in a case in which I am engaged, after receiving this letter. I changed my mind and did not ask him to go. I will rely on your statement of the case whether you agree with him or not. Yours truly.

The following is Mr. Slingerland’s letter to Mr. Secor:

ITHACA, N. Y., Nov. 20, 1890.

Mr. Eugene Secor—

Dear Sir:—Yours of the 11th inst. at hand. I enclose a copy of my Rural New Yorker article. I am as far as I can go in the matter. I was not inclined to go to offer, and I do not feel competent to testify regarding the capabilities of the mouth-parts of the honey-bee to bite, suck, or chew. But as Mr. J. H. Comstock, head of the Entomological Department, is as much a student of insects as you are of bees, you may desire to testify to them. He has kept bees and has taught the structure of their mouth-parts for years. For me to prepare myself sufficiently to testify with knowledge would require more time than I am able to devote to it. With Mr. J. H. Comstock, I do not think I should have any trouble to reverse the verdict of the lower court. I do not know enough about the mouth-parts to help you any.

I have just seen Prof. Comstock, and he says that he sees no reason, from what he knows of the mouth-parts, why a honey-bee should not be able to bite into a grape or peach. Hence, I doubt if you could get any testimony from him.

Sincerely yours.

J. H. SLINGERLAND.

I regret that these letters were mislaid during my absence from home and have but just come to my notice. Of course it is too late to be of any use in the lawsuit which was then pending. It is, however, a matter of such general importance that a full consideration of the subject will not be out of place.

I fully agree with Prof. Slingerland, that no one in the country is better qualified to give an opinion in general matters of entomology than is Prof. Comstock. I do not wonder that he made the remark that he could see no reason from the structure of the mouth-parts of the honey-bee why it might not be able to bite into grape or peach. I should greatly hesitate to state that a bee could not puncture ripe fruit with the mouth-parts referred to. I am rather inclined to the opinion that they could do so if they only knew their ability and had the curiosity to prompt the quest. I am, however, entirely certain that bees never do bite into fruit. They never attack a fruit until the skin of the fruit is intact, or the color is retained and the bee makes no visit. It certainly is the habit of bees ever to leave unmolested any and every sealed vessel like sound grapes, cherry or pear.

I presume I have experimented more in this direction than any one else in the country, and therefore I may claim with some assurance the ability to give a correct judgment in the matter. I have repeatedly taken clusters of sound grapes, that were very attractive to bees, and squirited them with pin or needle so that the juice would ooze out, and then placed them near the hive, or upon the alighting-board of the hive, and often upon the frames above the cluster of bees on the hive in the same way. They never attempted the nectar to be gathered in the field, at which time, as every apiarist knows, the bees are ravenous to gather from any possible source. The bees would suck the wounded fruit but leave every other grape entirely alone. This does over and over again in all ways with the same results. The bee has a large brain for an insect, but, brainy as it is, it seems unable to form a judgment in the matter of the coveted juice if the latter be scaled up by the skin of the grape.

Every grape-grower has observed at some time when the grapes of the vineyard are very ripe, and when the weather is sultry and humid, that all at once the bees will rush to the vineyard and commence to sip juice from the grapes in great numbers. Of course, in such a case the presumption would be that the bees had bitten into the grapes. Examination proves, however, that this conclusion is utterly at variance with the truth. The overripe grapes affected by the sultry, humid atmosphere, were squashed, and the tiny droplet of oozing juice hailed the eager bees and they rush to the vintage with one accord. No wonder the vineyardist blamed the bees. The truth blamed the vineyardist, as he being unable to have allowed the grapes to come so overripe. In such case, I have hung sound grapes among those visited by the bees, and not one was touched.

Some years ago, I was lecturing in the famous fruit region of South Haven, Mich. In my lecture, I stated the truth that bees never bite into fruit, and go or attack the fruit to sip the juice, except that bird, wasp or Nature had set the latter to flowing previous to the visit of the bees. Many fruit-growers present were vehement in opposition to my view. They were certain that I was wrong. I replied that I would show them, without question, that they had already express the wish that I would come the following summer and lecture to them again. I had express the fear of my inability to do so on account of college duties. I gave them an account of my experiments as given above, and said that I was not sure that bees could not eat into grapes. I was absolutely certain that they did not. They said that if I would come the next autumn they would prove to me that I was wrong. I replied that I would show them, without question, I would show them, that they had already express the wish that I would come the first train. I added, however, “Look closely before you send the tele- gram for if I show you after I come that I am right and you are wrong, then I shall want not only expenses, but pay for the return trip.” Many present said, “We’ll have you here next autumn.”

The telegram never came. I lectured there afterwards many times, and was gratified to find that the opinion on the question was entirely changed. The pomologists were one in the matter.

Some years later, I was lecturing in the grape-growing region of Sandusky, Ohio, where there was almost an exact repetition of my former experience at South Haven, Mich. The Sanduskians sent no telegram, but repeated my experiments, only to be disappointed in the same way. I would be askt how can I be so certain that bees never do puncture grapes, when I acknowledge a possibility that they might be able to do so as far as the anatomy of their jaws is concerned. Bees, like all other animals, not excluded ourselves, are creatures of habit, often habits, that may cause deleterious results from the简单的 act of one even the selection of the feed-bag to balance it on the horse. They simply didn’t think that meal as well as a stone could balance meal. While I feel sure that bees think a little, they are away behind us in this respect. They may be thinking about the flower-tube in search of the precious nectar. They never go in quest of the sweet unless the escaping odor summons their presence. It is easy to understand why, with their limited thought capacity, they are not slow to hasten to orchard or vineyard that they may not stay the waste. It is not, then, a simple question whether they can or cannot pierce the tender skin of overripe fruit. They never do so. And so
Valuable Experiments Conducted at the Geneva Experiment Station, New York,

BY ERNEST K. ROOT.

At the convention of the New York State Association of Bee-Keeper's Societies, held in Geneva on Jan. 9th, we had the very great pleasure of listening to an address by Prof. S. A. Beach, of the Geneva Experiment Station, detailing the various series of experiments that were instituted to determine the advantage, if any, of spraying trees while in full bloom. These investigations had been requested by a certain class who believed that spraying during the flowering period increased the value of the honey done by bees on the orchard. Prof. Beach called attention to the fact that a certain manufacturer of spraying outfits, had sent circulars broadcast over the country, advocating and urging the administering of poisonous mixtures during the time bees work on trees. Then there were also some among the fruit-growers of New York who advocated spraying at such times, but who could not carry into effect such practice because a law had been enacted by the legislature, making it a misdemeanor for any one to spray during the time the trees were in bloom. Some of the fruit-growers (not all) sought on several occasions to have this law repealed; but being foiled they finally secured the passage of an amendment which provided that trees might be sprayed during blooming-time for experimental purposes. The object of this amendment (and it appears the bee-keepers did not object to it), was to determine whether there was any advantage in spraying when the trees were in bloom, irrespective of any damage that might accrue to the bee-keeper. As a result of this amendment a series of experiments was begun at Geneva, and also at Cornell.

In the conducting of the experiments, Prof. Beach stated that several conditions were kept in mind: what was the effect of spraying while the trees were in bloom? Did the spraying at such times affect the blossoms? Did it kill the pollen? And if not, did it affect the setting or the development of the fruit? What part did the bees play in the matter?

Some bee-keepers, he stated, were inclined to make sweeping assertions to the effect that no fruit could set without the agency of the bees. This was altogether too strong a statement, because the importation of the bees was most important in the fertilization of some kinds of fruit-trees could not be denied. That question might be considered settled.

In the experiments that had been conducted, it was found that the blossoms that were sprayed just at the time they were being affected by the insects were either killed or injured. If the spraying was administered only during the blooming-time the poisonous mixtures did not go to the right spot, in a good many cases, for the simple reason that no cluster of apple blossoms were either killed or injured. Some blossoms would be closed and others opened at one and the same time. Some blossoms would be exposed to the effect of the spraying-liquids; and if no more spraying were administered after blooming-time, then those blossoms that were not open would not receive the benefit, and the fruit-eating insects in the other, would be destroyed.

He further showed that the spraying-mixtures are exceedingly harmful to the development and growth of the delicate pollen. Some pollen was gathered and taken into the laboratory and mixed with a thin syrup, then afterward a certain portion of spraying-liquid was applied, of the strength that is used in spraying trees. It was found in every case that the pollen failed to grow. Then the spraying-liquid was reduced 50 percent, and still mixt with pollen and syrup which had been prepared, and still the pollen-grains failed to grow in most cases. The professor said he was a decided in the opinion that spraying during blooming-time was exceedingly harmful to the delicate reproductive organs, and to the pollen itself in the flowers of the fruit-trees. He believed that bee-keepers who tried spraying strawberries while they were in bloom, and much to his sorrow. He mentioned a number of instances of fruit-men who formerly believed that spraying during blooming-time was the correct practice, but now had been compelled to change.

In the experiments that were conducted in four orchards located in different parts of the State, a certain set of trees were set apart and sprayed while in bloom, and only then covered with the paper bag. In the experiments there were every indication that those trees that were not sprayed during blooming-time yielded from a third to a bushel and a half more of fruit. In some cases they sprayed a half of one tree several times during blooming-time, leaving the other side of the tree not sprayed. There was a marked difference in the setting of the fruit on the two sides of the trees, and that difference was decidedly in favor of the side that had not been sprayed. In fruit-growers in fruit orchards in different parts of the State; and in one instance, at least (the professor would not give the name) a certain fruit-man who believed that spraying during blooming-time was the right thing to do, estimated, after his trees were sprayed he whole orchard at such time, that he had lost nearly a thousand dollars. He had had enough of that business.

The Professor stated, however, that there was one instance in which the fruit-man finally sprays his trees to prove to be advantageous; and that was, to kill the apple-scap that might come on at just that time; but even in such a case it has not yet been proved that spraying before and after bloom may not be equally efficacious. But generally speaking the conclusions held by all the professors that blooming-time was not only wasteful but decidedly harmful as well, cutting down the supply of fruit to an extent that, if generally practiced, would amount to thousands of dollars of fruit being lost.

On the evening of the first day we listened to an excellent address from another professor of the same station—Prof. V. H. Lowe. The experiments that had been conducted under his direction were for the purpose of determining the value of spraying trees while in bloom. He said one set of nine small pear trees (it was not practicable to use large ones) were enveloped in a hood of sheeting. This hood was large enough to slip down over the tree, something like a tent, and the sheeting was tied around the trunk of the tree. The object of this was to keep out insects, ants, bees or anything that might assist in pollinating the blossoms. For the purpose of ventilation, some windows were made in the sheeting, and the openings so formed were covered with the paper bag. On all of these so covered, there was a large number of buds, and all the conditions were favorable for a good crop, except that the flight of insects was entirely cut off. Now, then, for the results:

Out of the whole lot of trees covered, there was just one fruit. On another set of trees not covered there were 145. In the other case, where it was not practicable to envelop the whole tree, the blossoms were enclosed in the bag, the mouth of the bag being tied around the trunk of the limb. In one such instance there were 2483 buds of an apple-tree that were thus covered with the sheeting. Out of that number just one fruit matured. There were still plenty of blossoms on the tree, but none showed. Where the limbs were not covered. In one case, where the sheeting broke open so that insects could get in, there were 13 perfect fruits from 818 buds. It was clearly shown that bees and other insects are most important part in the pollination of average fruit-trees.

When the Professor was asked how much of this pollination was attributable to bees and how much to other insects, he said he could not get in their work. The professor being referred to a similar set of experiments made some years ago at the Michigan Agricultural College, showing the same results, said that the bees were altogether the earliest insects out; that a large number of them was in the bloom it is too early in the spring for other insects to be of any value. In his opinion the covering of the limbs or the
Convention Proceedings.

BY DR. A. B. MASON, SEC.

(Continued from page 10.)

LAST EVENING SESSION.

The convention met at 7 o’clock, with Pres. Root in the chair.

Pres. Root—The pure-food commissioner of Illinois, the Hon. A. H. Jones, is present, and will address us. I have asked Mr. York, the president of the Chicago Bee-keepers' Association, to introduce him.

Mr. York—Some other States have been heard from, but finally Illinois has caught up with them. For a long time we work to organize a Pure Food Commission in this State, and succeeded at the last session of the legislature, when the new law was past which provides for a pure-food commissioner. It is dear to the human heart, it is something good to eat. That is what we are all striving for, to get the very best product we can; and if there is anything better than honey —real good, pure, old-fashioned honey—we have not yet discovered it.

There has something been said about the Illinois State Pure Food Commission; if there is anything on the part of the commission I can say, it is also for my friend, Dr. Eaton, the State Analyst; if there is anything that will build up this cause more than another, it will be the State Food Commission. You have here, as I can testify, a very zealous friend in Dr. Eaton. The reason why I speak of that is, that all these food products come to him for analysis, and he must pass upon them. Now, I suppose that a good many of you who have been rather like good old Jacob of old, wrestling with the bee-question, have not thought of what a pure-food commissioner and a State analyst have to do. Think of it! When you look around over all the vast products of the State and see what we have to encompass, it is almost beyond imagination. You can hardly appreciate what we have to do; but I want to say to you that there are the following articles: the beehive products—butter, honey, maple sugar—there are the adulterated products—I don't care whether it is honey, I don't care whether it is maple sugar, or what it may be—we have them, in the State of Illinois, on the run. [Applause.] And we are going to keep them on the run. [Applause.] This is the last time that I want to recollect, the time of meeting with the Retail Grocers' Association of this State, down at Rock Island. There were 1200 or 1500 of them. I want to illustrate how we are doing in Illinois. Before I had talked to them, you will see how I proceed. You—sir—gave your address. We want the people to know that we have an ancient law, the food laws of Illinois, and we want you upon each bill that you send us, to make the statement, that these goods were manufactured in conformity with the food law of Illinois." And that pretty generally has been required, so that to-day, I don't care whether it is baking powder, I don't care whether it is maple syrup, or for what the article is, we don't have very much trouble now.

I said to them, "If you do this, gentlemen; if you see that is done, and then it proves to be an impure article, we will then prosecute the manufacturers and not the retailers.

What was the result? I will give you a little inside history of it. The secret history on the quiet—don't want you to say anything about it to those baking-powder people or any of them, how we managed it. The first people who objected to this were the Royal Baking Powder people; they said, "We have been manufacturing Royal Baking Powder 25 or 30 years; now to compel us to change, the label will be equal to saying to the public, our goods are impure."

I went to work with Dr. McMurty, the analyst for the company, and showed him wherein it was to their interest. I told him, "We feel confident the Royal Baking Powder is one of the best products." I remember Dr. Watson, one of the early revolutionists of this Association, who said, "You will not find a man who is better able to detect the adulteration of the goods, that are brought to market, to which the Bee-keepers' Association of this State want to give a good product. All you have to do is to say to the manufacturer, 'We want a pure article, something that will comply with the food laws of Illinois, and we want you upon each bill that you send us, to make the statement, that these goods were manufactured in conformity with the food law of Illinois." And that pretty generally has been required, so that to-day, I don't care whether it is baking powder, I don't care whether it is maple syrup for what the article is, we don't have very much trouble now.

I said to them, "If you do this, gentlemen; if you see that is done, and then it proves to be an impure article, we will then prosecute the manufacturers and not the retailers.

What was the result? I will give you a little inside history of it. The secret history on the quiet—don’t want you to say anything about it to those baking-powder people or any of them, how we managed it. The first people who objected to this were the Royal Baking Powder people; they said, "We have been manufacturing Royal Baking Powder 25 or 30 years; now to compel us to change, the label will be equal to saying to the public, our goods are impure."

I went to work with Dr. McMurty, the analyst for the company, and showed him wherein it was to their interest. I told him, "We feel confident the Royal Baking Powder is one of the best products." I remember Dr. Watson, one of the early revolutionists of this Association, who said, "You will not find a man who is better able to detect the adulteration of the goods, that are brought to market, to which the Bee-keepers' Association of this State want to give a good product. All you have to do is to say to the manufacturer, 'We want a pure article, something that will comply with the food laws of Illinois," And that pretty generally has been required, so that to-day, I don't care whether it is baking powder, I don't care whether it is maple syrup, for what the article is, we don't have very much trouble now.

I said to them, "If you do this, gentlemen; if you see that is done, and then it proves to be an impure article, we will then prosecute the manufacturers and not the retailers.

What was the result? I will give you a little inside history of it. The secret history on the quiet—don’t want you to say anything about it to those baking-powder people or any of them, how we managed it. The first people who objected to this were the Royal Baking Powder people; they said, "We have been manufacturing Royal Baking Powder 25 or 30 years; now to compel us to change, the label will be equal to saying to the public, our goods are impure."

I went to work with Dr. McMurty, the analyst for the company, and showed him wherein it was to their interest. I told him, "We feel confident the Royal Baking Powder is one of the best products." I remember Dr. Watson, one of the early revolutionists of this Association, who said, "You will not find a man who is better able to detect the adulteration of the goods, that are brought to market, to which the Bee-keepers' Association of this State want to give a good product. All you have to do is to say to the manufacturer, 'We want a pure article, something that will comply with the food laws of Illinois," And that pretty generally has been required, so that to-day, I don't care whether it is baking powder, I don't care whether it is maple syrup, for what the article is, we don't have very much trouble now.
For instance, you take maple syrup; it is worth about $1.40 a gallon; glucose is worth from 40 to 50 cents, and so on all around the line. It is, of course, by codifying both its label and its price, that it is, it gives the maple syrup manufacturer a show, whereas heretofore he has had none, and they have pretty nearly driven the maple syrup manufacturer out of the market; but, still, when you look at this it is only a show.

As I said, we want to uphold the very best articles; that is one reason why this law was instituted, so that the consumer may know exactly what he is getting, and pay for what he gets.

I once, your secretary, Dr. Mason, notified me that we were limited to five minutes. If I exceed the time, you will "call me down;" but I heard him say this evening what a nice, noble band this was. What was it he said? He had not heard a profane word, had not seen any one smoking, nor any one profane in his conversation. I understand that. If there is anything that ought to lift one above the plane of all these common, grotvelling things of earth, it is pure honey; it is the cause that you are engaged in, and others seeing your good works will enter into it right, like you are doing, and sell under proper colors.

This Commission, in all seriousness, this Pure Food Commission is to let the people know just exactly what they are getting, and when we do that there is no mistake, and we are helping you out. You are the bee-keepers as soon as you put the great banner of the pure food movement into the market, and other products that come in competition with yours; whenever they are compelled to label their goods just what they are, then the honey man has his innings, and he has a fair showing done, that is the exact object, as I understand it, this Commission is trying to attain.

In conclusion, I want to say to you that we have a very fine laboratory; we are located at 1623 Manhattan Building; Dr. Eaton, our State Analyst, has charge of it, and you have every benison of all the laboratory.

We have said to the other retail associations and manufacturers of the State of Illinois, whenever you find any one coming in competition with your business, that is manufacturing any product that is not what it represents itself to be, you notify this commission. We will send an inspector and inspect them, and then we will do the next thing—we will bring the strong arm of the law to bear upon them. Whenever we find from any reputable citizen that any one is violating the law by selling or manufacturing any article for other than what it really is, and palming it off for something that is inferior, all you have to do is to report that, and we will at once send an inspector, and we will seize the fellow, or cut him up to the tune of $1,400, or make him pay tribute to Caesar. [Applause.] So that if any one in your town, and you know it—if you live in Illinois—is violating this law, is running his business contrary to law, I want to tell you, as the State is doing, we will stand firm and willing, and anxious, for it is our duty, and we are paid for it, to see that the law is enforced all over this State. If it can be done here in Illinois, it can be done in every other State in the Union.

Another thing I might say while on this subject. Last October I had the pleasure of meeting with the National Commissioners' Association of all the States here at the Palmer House, and there a committee on rules was appointed to try to get rules and regulations that would apply alike to all the States—rules upon the law; and then another committee to formulate a law, so that each and every State might have the same law. Up to this time, each State has made its own laws, and I think that this has made a great deal of trouble, and I think in the next few months we can obviate a good deal of that. Of course the law can't be changed until the respective legislatures of the different States meet and pass new laws—a new law that may be suggested by this committee. We are trying to arrange so that every State can work in harmony, and when the producers of honey in one State produce honey, they know that the law that is put upon it will go into every State in the Union, that is the idea.

We are trying to help out in the interest of pure food, and especially pure honey; for we all believe in that, even if the glucose man won't say a word against good honey. I was speaking with a gentleman just the other day who had no interest in the glucose business, and whenever you see in Illinois a man that is imposing upon your rights, by making an inferior article, that does not come up to the law, if you will just report him, he will suddenly cease to do business, or else he will come to the law.

A. H. Jones.
Questions and Answers

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

Flat-Bottom Queen-Cells.

I have made a lot of artificial queen-cells, a la Doolittle, with flat bottoms. Since making them I have been informed that the bees will not accept them as readily as the round-bottom queen-cells. Which is the better?

COLORADO.

Answer.—I never before heard of queen-cells with flat bottoms, and I don't believe the bees would like them. Still, you can hardly be sure about anything without having the bees try it, and it is possible the bees might accept queen-cells with flat bottoms.

Amount of Honey in 10 Frames—Spacing Frames.

1. How many pounds of cap honey is there in 10 Hoffman frames (9 inch) before it is extracted?

Answer.—If I choose to place 8 frames in a hive, how far apart can they be put?

CALIFORNIA.

3. Is there any danger of the bees building combs on the cover?

Answer.—If I don't know what you mean by "9 inch," unless it be the depth of the frame, the usual depth of the Hoffman frame being 9¼ inches. Possibly frames well filled may contain as much as 60 pounds of honey, if there is no pollen in them.

2. That depends upon the width of the hive; but you probably have reference to having 8 frames, in a 10-frame hive. In that case you would space the frames about 1½ inches from center to center.

3. If you put 8 frames in a 10-frame chamber, and the cover is only ½ inch above the top-bars, as is generally the case, there will be no danger, I think, that the bees will do much more at building comb above than with the 10 frames.

Hives Damp and Moldy in the Cellar.

My nine colonies of bees are wintering in the cellar. They are in 8-frame dovetailed hives. The cellar is moderately dry and warm—vegetables keep well in it. The hives were brought into the cellar for winter and rests there Nov. 20th, the bottom-boards removed, and the hives placed crosswise upon a shelf some two feet from the ground. This shelf is about a foot wide, so the middle of the hive rests upon it, leaving a space three inches or more open at each end of the bottom of the hive for ventilation. The hive-covers have remained sealed down as on the summer stands. I noticed, Jan. 30th, on raising a hive-cover, that it was wet beneath, so much so that water dripped from it, and some mold appeared on the top of the frames. The colony, to all appearance, was strong and vigorous. I should judge all the other colonies are in the same condition as this one examined. What would you advise me to do with them?

MAINE.

Answer.—Your bees may come out all right if you let them entirely alone. But it is certainly no benefit to them to have water standing on the cover, and if that water drips on the bees it may be a damage. The moisture from the bees comes in contact with the hive-cover, and the hive-cover is so cold that the moisture condenses upon it just as water from the air settles on a pitcher of very cold water on a hot summer day. If the cover were warmer, the moisture would not be so much inclined to settle upon it. Try it by a thermometer, and try to keep it somewhere in the neighborhood of 45 degrees, or, to be more exact, keep it at the temperature at which the bees are most quiet. If the air of the hive is much warmer, it may be a good plan to raise each cover and put a common nail under it, so as to make a small crack for the air to escape.

The Hum of the Bees in the Apple-Tree Bloom is the name of the finest beekeeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and the "hymn" hummings, if we may furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can hear by sending in the names and addresses when writing us on other matters.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 30 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for $1.10.
Gleanings in Bee-Culture!

Gleanings for Jan. 1st contains these Special Articles:

Queen-Rearing in France, —by Giraud-Pabou
Candied vs. Bottled Liquid Honey, by Chalon Fowls
Wintering Bees in Clamps, (From Bee-Keepers’ Review), —by W. Z. Hutchinson
Conversations —with— Doolittle

Gleanings for Jan. 15th.

Co-Operative Organized Work, by R. C. Akin
An Extracting Outfit, by W. A. Gilstrap
Mintle’s Lightning Section-Folder
Stray Straws,—by Dr. C. C. Miller, Every Issue
PICKINGS from Our Neighbor- ing Fields, by Stenog, Every Issue

Gleanings for Feb. 1st.

Our Honey-Bottling Symposium, —by G. A. Deadman, Earl C. Walker, and Walter S. Pouder
The Personnel of the Uter Trial by E. R. Root
The Belgian-Hare Business, by W. K. Morrison, of Devonshire, Bermuda
Co-operative Organization, by R. C. Akin
Cuba, by The American Tramp

SPECIAL OFFER.—Each one of the issues mentioned above should be worth a dime to every bee-keeper, but we will send all three for only 10 cents. Hurry along your order before they are all gone.

BETTER YET—Send us 25 cents at once, and we will send you Gleanings in Bee-Culture 12 issues, 6 months, beginning Jan. 1st. Feb. 15th with all several articles too.

Cuba, by Harry Howe, Robert Luaces, and A. L. Boyden

Mr. Howe was formerly with Coggshall, New York, and has already given Gleanings readers glimpses of Cuban bee-keeping, Mr. Luaces, of Puerto Principe, considers that conditions are not well known and gives information somewhat different from other writers. Mr. Boyden begins a series of articles entitled, “Glimpses of Cuba and Cuban Bee-Keeping,” illustrated by photos taken by himself.

Remember—all 6 months for 25 cents, and your money refunded July 1st if you are not satisfied. Mention the American Bee Journal.

THE A. I. ROOT COMPANY, Medina, Ohio.
Bees Did Poorly.

The bees did poorly in this locality the past season. I did not get any swarms, and hardly secured honey enough for winter stores.

This is my second year of bee-keeping, and I have five colonies now which I transferred into new hives.

D. E. Evers.

Jan. 29.

Prospects Good for the Coming Season.

The past season was a bad one for the apiaries in this State. Most of them are left in a mix-up condition; many are disused, nearly all are reduced in number of colonies, and there must be many that have been wiped out of existence.

From my 10 colonies, spring count, I increase to over 130, extracted 6,000 pounds of very fine sage and buckwheat honey, and rendered over 100 pounds of wax. I have sold but little of the honey, and I shall make the wax into foundation.

The prospects for the coming season are much more favorable than they have been for three years, and if the conditions continue I will have a rich harvest for the bees. Yesterday I went out of apiary, some 25 miles from the city, to "size up" the situation as to the prospects, and came away in good spirits, although I got a good soaking before returning. Last year we had 457/100 inches of rain: this year to date we have had 9 inches, and it all.

G. B. LEWIS COMPANY.

WATERTOWN, WISCONSIN, U. S. A.

Your Whole Family Would Be Satisfied

with one of these systems. They are handsome, strong, sturdy, and durable. Selling on our plan you can exchange until you are satisfied. We have no agents

but sell all goods direct from our factories to the purchaser at wholesale prices. We are the largest manufacturers of manuka and hives in the world, selling to the consumer exclusively. We have purchased the place successfully for 13 years. You must have no risk

as we ship our goods anywhere for examination and use. We have the largest selection in the country as we make 150 styles of vehicle and 65 styled hives. Catalogue free.

ELIOT CARRIAGE AND HARNESS MANUFACTURING CO., ELYRIA, OHIO. 4,

Please mention Bee Journal when writing.

"Profitable Poultry Keeping"

IN ALL ITS BRANCHES.

This is the title and theme of our new Year Book. Contains 422 pages, 335 full-page and original illustrations of best poultry, nests, hatching, etc. in the country. Deals with every phase of the poultry industry in its various and profitable branch.

Treats also of the famous, non-poisonous, acidless, Violet Bee Klee, which is guaranteed to cut the very worst of the spring, self-ventilating, oil-steam, and electric brooders. This is the last of the year. Many orders for this stock. Three or more boxes or cases refunded. Send for free samples. Ask for book of prices and poultry free.

Address interested in.

CYPHERS INCUBATOR CO., CHICAGO, WAYNIA, I. A., BOSTON, MASS.

Please mention Bee Journal when writing.

INVESTIGATE BEFORE YOU BUY.

We want every customer to be perfectly satisfied before he spends his money. We investigate the claims of all manufacturers and dealers. We will show you that the SURE HATCH INCUBATORS and COMMON SENSE FOLDING BROODERS are giving better satisfaction than we anticipated.

The price of the latest style, which is a remarkable and sure. They are built for busy people, who want no time to fuss and bother. Our catalogue is FREE. We don't sell and you pay for it. We don't want you to take the trouble.

SURE HATCH INCUBATOR COMPANY, CLAY CENTER, NEBRASKA.

Please mention Bee Journal when writing.

SPLEET HICKORY

YOU CAN BEND IT

BUT YOU CAN'T BREAK IT

You can't afford to buy a "shoddy" vehicle when you can have a genuine Hickory. You can't afford to buy a vehicle that will break under the greatest test. "Spleet Hickory" will stand up through the most severe test. We sell to dealers and manufacturers only. The prices are very reasonable. We stand behind our goods. We are the manufacturers. We sell vehicles and harnesses direct from factory.

Oleoh Carriage Mfg. Co., 0 W. Broad St., Columbus, 0.

Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel.

(You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons. We all like to have the people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey, at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cents; two buttons, 6 cents. Each: 5 or more, 5 cents each. (Stamps taken.) Address, GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
Farmers and Sweet Clover.

We have had two poor seasons here, but the indications are fair for a good honey crop next season.

Farmers in this vicinity have begun to see the benefits of sweet clover. One of the leading farmers of this section sowed 10 acres of clover to sweet clover last July, and says he will get two crops of hay next summer, plow the third crop this fall, and raise wheat on the land the next season. Thus he raises a full crop each year, and improves his land by the rotting of crops, which he says is the cheapest fertilizer he can get. He expects to plant another 10 acres of clover next spring, and the latter part of July or the first of August some of his clover seed among the corn in the fields, which will not use the use of his land any way. He thinks the clover improves the yield of wheat about 10 bushels to the acre. He has been experimenting with it for several years. He intends to commence keeping bees, and if he does he will make a success of it.

C. W. SNYDER.

Poor Prospects for Next Season.

I have 80 colonies of bees in 8-frame Langstroth hives, and run them for comb honey. As the past season was a poor one in this locality they did not average above 25 pounds per colony, and I do not think that the honey-crop of Utah would average more than 10 pounds per colony.

Brood barn has been quite prevalent here the past two years; it seems that the disease has a tendency to follow a poor season.

The prospects for the coming season are not very bright; we depend upon irrigation for bee-forage, and as but little snow has fallen up to date, if we do not get more snow the season will be disastrous indeed to both farmers and beekeepers.

E. E. NELSON.

Utah Co., Utah, Jan. 28.

Bee-Moths and Millers in Apple-Trees.

I had 25 colonies of bees during the past season, 20 of which I had under the grape-vines, and in the orchard under the apple-trees. Only one colony out of the 20 under the grape-vines was bothered with moths, while all 5 of those under the apple-trees had moths in them. I put two under a crab-apple tree which bore deep-red apples, one has fallen at intervals conducive to the most good. We may reasonably expect enough more rain to round out the year, not only to the benefit of the apiary, but to all other industries which require it.

I do not think there will be any overproduction of honey, however favorable the season may be, because so many apiaries are in such poor condition. It will take most of the season to get the colonies in good working order again, therefore I do not anticipate that the Eastern market will be overstocked with California honey.

My year is up, and I want the American Bee Journal for another year, because of the benefit I derive from it.

Why Fuss with Hens?

When you can get an incubator and Brooder that works as satisfactorily as the "SUCCESSFUL" Incubator, it must be evident what a value the money spent for the incubator will be. Patented to the American Bee Journal Co., Des Moines, Iowa.

Send 25c and receive our free Catalogue No. 11.
under a fall apple-tree which bore apples about the color of lemons, and two under a winter apple-tree, the apples having a brownish color (rash coats), and the worms from these trees drop on the hives underneath them, and work their way into the hives and around the sides, and in each instance the eggs were of the color of the apples in the tree above the hive on which they fell.

It is my opinion that the worms that fell from the trees crawled into the hives the color of the tree from which they came until they become millers.

The hives which got into the colony under the grape-vines were of a natural color.

I went into the country to visit a friend, and while I was there he made apple-cider, and asked me to help him, which I did. We went to the orchard and gathered the very best of the apples, cutting out the cores and all the rotten and worm-eaten spots. After throwing the cores away I noticed hundreds of millers gathering on them, then I looked up and saw as many among the trees, and some of them alighted on the apples. The next morning I examined the apples, and found that the millers were stingling them, and planting their eggs in those that were ripe or matted. The millers sting the apples at the stem, at the blossom end, and on all sides, and when the eggs are hatch into worms they work themselves toward the heart of the apple.

I would like to know if it does any good to spray the trees while they are in blossom. Some of our professors claim that the pears are infested and the blossoms are killed when the trees are sprayed. I do not believe it does any good to spray the trees, as my observation is that the millers plant their eggs in the apples after they have matured, AUGUST ROSENBERGER.

Iroquois Co., Ill., Dec. 10, 1900.

[See the article on spraying fruit, on page 120 of this number.—Editor.]

Convention Notice.

California.—The annual convention of the California B. K. A. Bee-keepers’ Association, will be held in the Chamber of Commerce, at Los Angeles, Feb. 2d and 3d, 1901, beginning at 1:30 p.m., on the 26th. Several valuable papers have been promised, and we expect an interesting convention. J. F. MCINTYRE, Sec'y, R. WILKINS, Pres.

Inter-State Box and Manufacturing Company,
HUDSON, WIS.
QUEEN-BEE (Magnified) AND EGG.
Photograph from life.
Long-Tongued Bees
ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2), or, one Untested Queen FREE as a Premium for sending us FOUR new subscribers (with $4.00).

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder will use direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—"first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO, ILL.

20 cents Cash *** This is a good time to send in your Beeswax. *** paid for Beeswax.

Best White Alfalfa or Basswood Extracted Honey
ALL IN 60-POUND TIN CANS.

ALFALFA HONEY......

This is the famous White Extracted Honey from the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

A sample of either, by mail, 8 cents; samples of both, 15 cents— to pay for package and postage. By freight—one 60-pound can, 95 cents per pound; two cans, 9 cents per pound; four or more cans, 85 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box.

Order the Above Honey and then Sell It.

We would suggest that those beekeepers who did not produce enough honey for their home demand this year, just order some of the above-mentioned Honey. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Bee-Keeper's Guide:
Or, Manual of the Apiary.
—By—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book publish-to-day. Fully illustrated, and in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is so equipped, or his library complete, without The Bee-Keeper's Guide.

This 18th Edition is in the new edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to present subscribers only, and no person is also given to the two new subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with $2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for $1.25, or we club it with the Bee Journal for a year—both for only $1.75. But surely anybody can get only TWO new subscribers to the Bee Journal for a year, and then get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
144 & 146 Erie Street,
CHICAGO, ILL.
CHICAGO, ILL., FEBRUARY 28, 1901.

No. 9.

41st YEAR.

Editorial.

Joining the National in a Body.—Several local associations have already taken advantage of the provisions in the constitution of the National Bee-Keepers’ Association, which reads as follows:

"Whenever a local bee-keepers’ association shall decide to unite with this Association as a body, it will be received upon payment by the local secretary of $1.00 per member, provided that the local association’s membership dues are at least $1.00."

Referring to this matter in a recent letter to this office, Dr. A. B. Mason said:

Ernst Young—I have just forwarded a draft to General Manager Secor for the amount of fees required to make the members of the Cayuga Co., N. Y., Bee-Keepers’ Society members of our National Bee-Keepers’ Association. Also, I have just received a letter from the Worcester Co., Mass., Bee-Keepers’ Society, making inquiry as to the terms on which their organization of 40 members can join the National.

Won’t you just suggest that all the local bee-keepers’ societies on this continent “go and do likewise”? Also add that it is necessary to send the name and post-office address of each member with the membership fee.

A. B. M.

Layer.—I have just received a letter from General Manager Secor, saying: “New members are coming in all the time, and the finances are in a healthy condition.” That’s the kind of a “morning” to have, and to hear, and to belong to.

A. B. M.

We are indeed glad to learn of more bee-keepers’ societies taking advantage of the low membership fee when joining the National in a body. We believe the Wisconsin State Bee-Keepers’ Association was the first thus to join, and was followed by the Chicago Bee-Keepers’ Association a month or two later. At the recent meeting of the Wisconsin Association the memberships were renewed for both the State and the National associations. This is just as it should be.

The fact that more organizations are “enquiring the way” is a healthy sign, and should ultimately increase very largely both the membership and the treasury of the National. It will be surprising to all, what can be done in many ways when bee-keepers once unite, not only to defend themselves, but to push their interests on every occasion when to do so is both proper and right.

We have been greatly encouraged during the past month or two on account of receiving so many membership fees at this office, all of which have been duly forwarded to General Manager Secor, who doubtless has promptly mailed individual membership receipts. We are ready and willing at all times to receive such dues and send them to Mr. Secor.

We wish there might be more local societies organized under the provision of the National constitution, as before quoted, and that all such local organizations might see their way clear to elect two delegates to the National convention each year. This would not only be an honor conferred upon those delegates, but would furnish the kind of representation in the National that every local association should have. Suppose there were 50 local associations scattered over the United States and Canada, each one of which should send two of their best men to represent them in the National Association. If the representatives would attend the National there would be an assured attendance of 100 of the best bee-keepers in all the country. This of itself would institute a great convention, to say nothing of the attendance of bee-keepers residing within 100 or 200 miles of the place of holding the National convention. Of course, there should be more than 50 local societies in the United States alone.

What we would like to see is this: Let there be county and district associations holding an annual meeting, and sending one or two delegates each to the annual State convention; and each State association send two delegates to the National. This would give representation to the humblest members of the pursuit. Membership dues of $1.00 in the county or district association should be sufficient to make each bee-keeper a member of all three organizations. Twenty-five cents of the $1.00 can be retained by the local association; 25 cents to be sent to the State organization; and 50 cents to the National, just as is provided for now.

We fully believe this scheme is entirely workable, and that some arrangement ought to be made at the next National convention providing for this plan, or something similar. We are ready to cooperate along any line that will give promise of uniting the bee-keepers, and building up an organization that will be able to take care of their interests.

The Anti-Bee-Legislation, as recently proposed in the Wisconsin Legislature, has received its deserved quietness. Mr. N. F. France, president of the State Bee-Keepers’ Association, wrote us as follows about the matter, Feb. 9th:

"This morning the Legislative Agricultural Committee of the Assembly, for the purpose of obtaining the support of the bee-keepers, has voted a resolution for the establishment of a bee-keepers’ association, with which the proposed bee-keepers’ association would be affiliated. The resolution has been referred to the Agriculture Committee for consideration, and will be brought up for a vote at the next session."

Mr. France has been working almost night and day since the State bee-keepers’ meeting, Feb. 5th and 6th, to accomplish the above action. We knew he would be successful, for there was no issue of the bill referred to. For instance, the great poultry industry of Wisconsin is not taxed. Why, then, tax bees, which are so much more uncertain stock than poultry? Personally, we think bees should be taxed at a small value per colony, but not before poultry is put on the property list.

Again, the bill proposed to tax those bee-keepers who desired to practice migratory bee-keeping. It provided that any bee-keeper who desired to move his apiary to another field where the bees might take advantage of a better honey-flow, must pay a license fee of $A per colony per month before he had the right to move into another township. That is, if he had 100 colonies which he wished to move to another field for four months, he would have to pay a license fee of $400!

No sane legislator would favor such injustice, we are very certain.

The Apiary of Mr. F. M. Wagner is shown in two views on page 135. No. 1 presents it with the revolving roof in a horizontal position to shade the hives from the noontide sun. It shows the roof in a slanting position to protect from the afternoon summer sun, or from chilling winter blasts.

In a letter accompanying the photographs, Mr. Wagner says:

The hives are the 10-frame, with an all-wood blanket between the brood-chamber and the super, but held up from the frames so the bees can pass over from frame to frame. The super is then filled lightly with short straw. A little ventilation is provided to overcome the climate (Adams Co., Ill.), under a trial of four winters—south of the 40th parallel, and three miles east of the Mississippi River.

Value of Bees to Aliskc Clover.—Secretary Cause, of the Ontario Bee-Keepers Association, said at the last convention that the nearer a field of Alsike clover is to an apiary the better the yield of clover seed. He had applications from two men who wished him to locate bees near them. The value of bees to fruit-growers and farmers is being recognized over and over and time goes on. Ignorance is a hard thing to overcome, but it’s yielding over and over.

Tin Cans vs. Barrels.—Mr. J. J. Martín, in his address in Bee-Culture, offers another argument in favor of tin cans for shipping honey. He says: "Freight rates on honey in tin cans, as compared with barrels, are $1.10 per 100 pounds; on honey in barrels, $1.30 per 100 pounds; on honey in glass, $1.30 per 100 pounds. Observe that the weight of bees, bees and glas is in the same class. The railroad companies evidently know where the greatest risks are."

Comment is unnecessary.
**Weekly Budget**

Prop. A. J. Cook writes us that the "bull-dog ant" of Florida, mentioned on page 72, is "Camponotus esuriens, Smith" which he learned from Dr. L. O. Howard, entomologist of the Department of Agriculture, Washington, D. C.

The offician of the Ontario Co., N. Y., Bee-keepers' Association is as follows: President, W. F. Marks; vice-presidents, H. L. Case, John Pagnoni, New Albany; secretary, F. Geymer, of Naples; treasurer, L. B. Smith; and honey inspector, E. H. Perry.

Mrs. Artie Bowen, of Mereed, Cal., writing us Feb. 12th, said:

"I think this is going to be a good honey-year in California. The bees in this locality have wintered well so far, and our winter is about over. The almonds are coming into bloom, and within two weeks our orchards will be in full bloom."

Mr. W. E. Flower, of Montgomery Co., Pa., is one of the noted bee-cranks around Philadelphia. He it was who gave a short illustrated talk on bees when the National convention met there in 1891. It was enjoyed by all. We understand that he expects to give another talk on the same subject at Franklin Institute very soon. There will be a male quartette to sing "The Hum of the Bees in the Apple-Tree Bloom," accompanied by piano, cornet, and two violins. They are good players and singers, as they all belong to the church choir of which Mr. Flower is a member, and they will doubtless make things hum. Mr. Flower expects to have a lot of new slides to show, and some new jokes and stories to help entertain his audience. Mr. Flower knows how to do it, and will be able to give a good entertainment.

Mr. L. H. Biemrege, of Ogle Co., III., writes us that during the meeting of the National convention in Chicago last August, he suffered a stroke of paralysis so that he had to leave for his home before the close of the meeting. It left his nervous system in bad condition, especially affecting his eyes, so that it is very difficult for him either to read or write. He was 78 years old last New Year's day. All will unite in hoping that he may soon recover. He reports his bees as wintering well.

Rev. A. B. Metzler, of Will Co., III., whose questions were answered on page 99, writes us Feb. 16th, that the case he cited in your note is the case of a friend of his. His child was born on Feb. 1, 1844, and all the February 1st dates since that time have been "mothers' days!" That's very good. We will forgive him for the joke, seeing he sent his dollar membership fee for the National Bee-keepers' Association.

Bishop Wm. A. Bills, of Salt Lake Co., Utah, wrote us Feb. 16th, that bees were a failure in Salt Lake county last year, though in previous years he had over 350 pounds of honey per colony. He sent us two clippings about bee-keeping in Uintah Co., Utah, mentioning one firm of bee-keepers who had 160 colonies of golden Italian bees that averaged 3814 pounds per colony last season. Ashley Valley, in which the county sits, is about 20 miles long by 6 wide. Central, the county seat, is a busy little city, and is centrally located in this valley. It is a progressive town, with neatly graded streets, paved sidewalks, and well-equipped businesses. In the matter of taxes it stands as a model. It has never levied what is known as a town tax, and all debts are paid off on a par, with a balance in the treasury. Very likely they are not cursed with saloons.

Bee-keeping seems to be a new industry in Ashley Valley, but it is making astonishing strides, and one that promises to forge still further ahead in this sterile desert section. The honey-source is principally sage and the grade produced is of the finest. By the end of the season the government gave one 340,000 pounds were sold out of the local consumption, 340,000 pounds were sold at a price of 5 cents per pound. The success which has followed the efforts of bee-keepers in that part of the State is encouraging them to equip their apiaries with the latest appliances, which are an absolute must in the bee-keeping business. It is a little less than marvelous that so much real sweetness should be found in what was once such a desert-like and forbidding region.

Mr. G. Gleesman, of Sioux Co., Iowa, wrote us as follows Feb. 16th:

"The American Bee Journal is a welcome visitor each week. I could not get along without it. By the way, the wood binder is just the thing. Every subscriber should have one so he can file away the journals each week, and always have them all together, ready for any reference he might want."

---

**Convention Proceedings.**

By Dr. A. B. Mason, Sec.

(Continued from page 122.)

Pres. Root—We will now listen to Mr. R. C. Aitkin, on the subject of Co-operative Organization Among Bee-keepers.

To organize is proper, right, and just. Like all else, organized combinations may be powerful for good or evil, according to the inclinations and desires of the organized. Condemn not organization, only its improper use.

Never in the history of the world have there been times of so great organization as at the present. Unions, associations, syndicates, trusts, etc., exist on every side. Were it not for organized business in social affairs, we never would have reached the heights of luxury, wealth, and power, now enjoyed by the present age. Even the anarchist organizes to break down governmental order. We organize for mutual help in all lines of business, industries, education, religion, and government.

But for what shall the bee-keepers combine? This, our national association, is largely social and scientific, with a little business mix in now and then, and a mutual protection against unjust financial and moral enemies. So far this is good, but it does not cover, by a long way, the ground it should to help the people where they need it most, in properly distributing our product.

These are days of specialization, as well as organization and co-operation. More and more do we become dependent upon one another in all our affairs, as we grow in organized work. How long will our government, the postal system, railroads, churches, schools, and the very many great organizations need, to stand, that is the only test of the future of those concerned? It is plain common-sense that in these days when specialization is everywhere prevalent, in almost everything, that those who produce our food—wheat, corn, potatoes, butter, eggs, meat, fruits, etc.—there should be co-operation.

But what is the great need of the bee-keeper to-day—in what particular direction should he co-operate to obtain best results? Is it on the social side? Surely not. We have social facilities in our organizations here and there, and in our class journals. The crying need of to-day is business co-operation.

Producers bring their wheat and other grain to the elevators; cattle, hogs and sheep to the stock-yards; and fruits to the local depots. In every producing locality, the products of that territory find buyers and places to deliver and store the products—facilities for handling. Just take one good look at the facilities everywhere established for the accommo-
dation of the principal product of any locality. We have ten bushels of wheat and my neighbor his hundreds or thousands, there is one common price and I can take my ten bushels and sell it and have my check just as quickly and surely as the large producer on his hundred. Now, turn your attention to the natural products—can you go to town, any and every town, and any day, and there sell your products? You may sell a few pounds or cases to your local dealer, just what he needs for immediate retail. Should you produce more than the half dozen cases your grocer wants, and want to get cash out of it, what will you do? Well, ship it to some city market such as Denver, Kansas City, Omaha, Chicago, or other practical market; "consign" it to somebody you do not know, take all the chances yourself, get your money when you can in the
"sweet by-and-by," or order honey pushed into the market, which means to give it away. Looks gloomy, doesn't it?

Honey-producers are so scattered, the product so limited in a given locality, that there is no inducement to put in proper facilities for the handling of the goods. Comb honey is somewhat regular and has a reasonable standing, but extracted, as handled by most producers, must not get out of sight of the producer until it is eaten, for you know how they turn "sour," and be it ever so fine, some one other product can be sold at any and at times, and for spot cash, honey must beg to be taken in dribs!

Tell me, if sugar would go liquid in the grocery, must the capital outlay be the same as for honey? Must he handle from 1000 cases of sugar and 1000 cases of honey, a few acres of corn, of apples, wheat, and of such a few bushels: a half dozen hogs, one or two bees, etc. such are the masses, and are the people that must and will sell at just prices, or possible, small dealers and producers.

These small producers are said to ruin prices, and the charge is true to a limited extent. But can we blame these people and after all what can we do? They are at the mercy of the men who have a greater civil and economic position, and perhaps might realize, and that quickly, and since there may not be a demand for their product and it is pushed out to ship to distant points, they are practically compelled to force the market, and the stock sells for less than its real and true value, and so prices are not what they should be.

It is necessary, then, that provision be made whereby, especially the small producer, may have a market for his product. The large producer is told to buy up the little lots, and get them out of the way, but large producers have difficulties to face, too. It does not take many little lots to require several hundreds of dollars even thousands to buy them. The large producer has to face the fact that if he competes in the general markets, and with other large producers and shippers, he has a very small and pitiful run for his product, and to do this causes him to reach out to the limit of his own capital and ability. Yes, even the large producers, too, are struggling to keep from being eaten up by the still larger ones.

In these days when our products are transported hundreds and thousands of miles to be distributed—in reality exchanged for other products which we have not in our own living, but which we think, or suppose, have—and social conditions almost compel us to have—there must be facilities for carrying out the economically exchange.

Look again at the immensity of the systems of transportations of products. The packing companies have their special cars. The railroad companies have cars specially designed to transport fruits and deliver them successfully at distant points; and grain, sheep and cattle cars. Not only this, but everywhere distributed throughout the country are both the gathering and distributing facilities. The large cities are constantly in position to handle a certain amount of produce and ship. In a single department, but what of it? Small producers, 500 or 1,000 miles from these places, do not want to consign. They can not afford the local freights and other expenses. The 10 or 20 cents per case of charges that the small producer can not make must fall to him than do the hundreds of cases of the large producers and commission and other dealers to them. These small producers have honey to sell, and must sell.

In short, most of all, is the facilities for gathering the product and relieving the poor small producer by paying him for his honey and wax. These facilities must reach out from some central place and come close enough to the little apiaries so that their product can be delivered to the consumer, and get a fair price for the minimum of freights. That such system is very much needed is surely evident, but as yet the solution of the difficulty is not clear. Many difficulties lie in the way, yet none but can be overcome.

I shall not attempt to lay down set rules to govern in working out this question, it can only be by cooperation. I say by cooperation, not by it pure and simple, according to the general acceptance of the term. I think I know enough of human nature to know that this Association can not in open convention work out such problems and carry them to completion. We have ideas as to what we need, but how to obtain the results we do not know the end result, at what is needed and advising, yet there will be such diversity of opinions that no tangible thing can be arrived at. Your humble servant has been thru the mill and knows a few of the difficulties to contend with, how a convention will wrangle, and suggest, and advise, and demand, etc., then in the end tell a committee to go ahead and bring order out of chaos, yet not a dollar for the expense of doing it.

Discussion in convention is all right, and appointing committees is all right, but committees need financial help. Select for the committees straight, honest men—men who are the most familiar with the business world and methods, who yet have the facts at hand. Remember that we must do much as we can, not as we like. We want to put our product as near where it ought to be as possible, but in doing this we have great difficulties to surmount.

Having selected proper organizing committees and given them necessary funds to carry on the work, empower them to act—I would say almost absolute power. When your committee runs against unforeseen stumps they can not pass and disregard and accumulate fences for the houses to pull up or get around that stump. They must act, so give them full power. Here is the weak place—the people can not or will not see the great difficulties in the way, get discouraged and quit.

In organizing, remember that there are State and other laws to comply with, there are business customs that you can not ignore, that others have rights as well as you, and that you will have to set arbitrary prices and make extravagant demands. Yet, want to get in touch with the whole world so far as possible, for in these days even oceans do not separate neighbors and co-operators. Strive to understand each other. Help others and thereby help self. Two, three, or more producers should come together. I do not think for one minute that there is or can be over-production—no, never, while our neighbors just across the waters are starving by the millions.

When the bee-keepers are fully organized in a co-operative way, the head national office will know what you and I are doing, north, east, south, and west. The sub-State offices will know what is known at the general head, and in turn transmit to the various local branches or to the individuals, the facts according to the need and demand. Is it a mighty undertaking? Yes, but results would be mighty. Will it harm anybody? Yes, just about as you are harmed by the complete postal system that takes in almost the world and carries your mail almost for nothing.

Do you catch the spirit? Then proceed to co-operate. Some are now at it, but hampered by the utter indifference, jealousies, or greed, of the many. To help a brother helps you; to tear him down destroys both.

R. C. AIKIN.

Pres. Root—The matter is now open for discussion. Mr. Aikin comes from a State where they have an organization that carried out some of the ideas he has advanced before. They are not only in practice, but doing practical work and do produce results. Many of you probably have not had any experience in this line and possibly do not care to discuss it.

Mr. Aikin—Mr. Mason has a matter that he wishes to bring up before the Convention before we close. Are you ready to present it at this time?

(Continued next week.)

"The Hum of the Bees" in the Apple-Tree Bloom is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is the property of some to which the best bee-keeper may not as yet be written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

The Premiums offered this week are well worth working for. Look at them.
A CORRESPONDENT sends in some questions and wishes me to answer them thru the columns of the American Bee Journal. His first question is, “Can a five-banded queen be bred—or a queen whose bees are five-banded—from pure Italian queens?”

My first answer is, “Yes,” for the simple reason that there is no such thing as a pure Italian bee or queen, when viewed in the sense of a pure race or variety, as the German or black bee is pure. At best, the Italian bee is only a thoroughbred, and that these five-banded bees have been produced from what was originally only three-banded or lighter-colored bees, is a good proof that the above assertion is correct.

Perhaps it may be well for me to give right here a bit of history. In the early experiments of Mr. Cyprian, the so-called five-banded bees—the “golden Italian” more nearly expresses what they are, for there are many queens in this country to-day which give bees whose abdomens are a solid golden or orange yellow the whole length, except the tip; no bands whatever to be seen on three and four-banded stock. The history is this:

In the early seventies, H. A. King, then of Ohio, and Jas. M. Brooks, of Indiana, were breeding for yellower bees than the average of the older Italian stocks showed. In 1872 I procured some of Mr. King’s stock, and continued to improve them till near the eighties, the apicultural world having lost sight of Mr. King, meanwhile. At that time I exchanged a part of my stock for some of Mr. King’s, afterward, by purchase, got the last of his very best stock, he going out of the business. In the early eighties I sold one of the best queens I could rear, along the yellow line, to L. L. Hearn, then of West Virginia, he and myself exchanging bees, and from that time for the next three or four years, if I am correct, all of the so-called five-banded bees, of Italian origin, that are in the world to-day, spring from the King-Brooks stock. Others produced the so-called five-banded bees by a promiscuous crossing of Cyprian, Syrian and Italian stock, but such have shown their origin by their bad qualities, to a greater degree than either parentage.

OLD OR YOUNG BEES WORKING IN THE SUPER.

The second question is, “Is it the old or young bees that work in the surplus arrangement? I had supposed it was the younger bees, but a neighbor contends that it is the old bees.”

To that neighbor of yours, if he will try the experiment of changing a black queen for an Italian about June 20th, some year, noting the time the first Italian bee hatches, and on the forecast of the 14th day from that time look at the entrance of the hive, he will find none but black bees issuing therefrom; while if he removes the cover from the surplus arrangement he will find nearly all of the bees there to be Italian. If he does not so find, his experiment will prove different from any I have ever tried, and I have tried this in experiments several times.

When a colony is in a normal condition, I have found what Elisha Gallup gave in the American Bee Journal during the early seventies, to be quite correct, namely this:

Three days in the egg form, six days in the larval form, and 12 days in the pupa form, making a period of 21 days from the egg to the perfect bee. Very warm weather will hasten the matter, while very cool will retard. Thebee when it first emerges from the cell does nothing but feed itself for the first day or two, when it commences to become a nurse. Then the nurse becomes the super foreman, doing this from 12 to 3 p.m., and it continues these playsests occasionally till it is from 14 to 16 days old. The young bee takes its first flight or playsest, marking its location, vindicating its excrement, etc., when six days old. The older bee when it is fully equipped with wax, nectar, secreting wax, building comb, etc., till it is 14 to 16 days old. The young bee takes its first flight or playsest, marking its location, vindicating its excrement, etc., when six days old. The older bee when it is fully equipped with wax, nectar, secreting wax, building comb, etc., till it is 14 to 16 days old. The older bee when it is fully equipped with wax, nectar, secreting wax, building comb, etc., till it is 14 to 16 days old.

Shipping Queens by Mail—Unusual Experience.

By G. G. Foppleton.

ONE is very apt to give a wrong impression whenever he himself goes to work to give an explanation or reasons for that statement. This was especially true of the statement I made during the late Chicago convention, while the question of shipping queens by mail was being discussed. I had "abandoned the breeding of queens by mail." Of course, the inference was that the mails were responsible for the poor quality of the most of my queens obtained that way, which was only true to a limited extent.

For some reason which I can not explain, I have failed in getting even a fair proportion of queens that would do well. This applies only to the queens I have received since I came South—not to those received when I lived in Iowa. This is what I 15 or 20 years ago I had "abandoned the breeding of queens by mail." Of course, the inference was that the mails were responsible for the poor quality of the most of my queens obtained that way, which was only true to a limited extent.

usually before the white clover honey-flow commenced—giving them these queens from the South. These nuclei thus given laying queens so much earlier than I could rear queens myself, would do enough better more than to pay first cost of the queens, be in better condition for the coming winter, and save me all the labor and expense of rearing extra early queens. No practical honey-producer in the North needs to be told what this means.

I observed closely for years, and could detect little or no difference between the quality of these queens and those of my own rearing, some of them proving among the best queens I ever owned. Were I now keeping bees anywhere in the North, I should make a very large use of early queens from the South. I should, of course, get them as able and careful breeders as I could, and I don’t think it should have any special fears of injury to queens in the mail.

Why queens would reach me all right when I was in Iowa, and don’t so in Florida, is one of the unexplained mysteries of bee-keeping. I only know the facts, not the reasons therefor. Perhaps some of the readers of the American Bee Journal can give us more light.

Dade Co., Fla.

No. 13.—Interesting Notes on European Travel.

By C. D. DABANT.

I HAVE well-nigh exhausted my subject, unless I take you on the ocean with me, or unless I take you to the place of my birth and make you acquainted with the companions of my young days, and show you in detail the narrow, winding streets of the old city, or the lonely ram-part walls. You would wonder at the lack of life in their business streets, but would admire the whiteness of the houses, where coal smoke is unknown. You would wonder at the numbers of roaming dogs, at the habit the people have of walking in the middle of the street, owing to lack of room on the sidewalk where two people can not pass each other without one of them having to step off into the gutter.

In bee-culture you would see but little of interest, and yet we could not very well do so without Europe, our European bee-keepers. Did they not originally invent the movable frames, which Langstroth only made more practical by hanging them free from the inner walls all around? Did they not invent the first rudiments of comb foundation? Did they not give us the honey-extractor, the perforated zinc? Do they not, from time to time, give us the most interesting scientific experiments? The microscopic studies of Count Barbo, of Milan, made into 32 lithographs some 25 years ago, are yet at the head in the way of plain descriptions of the anatomical structure of the bee. But for practice, for production on a large scale, with the most economical results, give us America.

But it is strange to see the very deep ignorance of the masses concerning America, on the Old Continent. Somehow they have a very clear idea that we are all millionaires, all Vanderbilts, Gouds, or Rockefellers, but they can hardly separate our millionaires from the Indians and the buffaloes. To them the United States is a country full of machinery and wealth, and yet half savage. The geography of the new continent is one of the things to come. They have a faint idea of the location of Chicago—somewhere near New York, or on the big Salt Lake. After two months of travel I had to give up the idea of enlightening any one as to where I lived by saying “in Illinois.” So I had become accustomed to using the term, “On the Mississippi.” Once while traveling thru England I met a gentleman, who, after I had given him that answer, said, “Oh, very well. Do you live above Niagara Falls or below?” That is about the extent of the knowledge that most of my French acquaintances could show of the geography of the United States. Yet they are all very well acquainted with countries that seem to us rather remote. Africa, Madagascar, Siam, and China, seem to be very familiar. But those places have not built up as America did, and what answered in their geography 50 years ago is still about right at this day, while the growth of America makes a new map necessary every 10 years.

A reader of the American Bee Journal puts this question to me: “How would you like to go back to Europe to live?” Not at all. America is the country for me. I should like to re-visit the places I saw—I admire the beauties of the European cities, of their buildings, which are certainly more artistic and better taste than our plain, square brick boxes, which we call business houses or factories. They do not have a 20-story sky-scraper by the side of an ugly 3-story square brick house as we do here; and around their monuments it seems as if a part of the ornaments had been lavished on all the surrounding buildings. This is true of either London or Paris. But give me America for a neat farm-house, with a good barn far enough from it to keep the pigs and the manure smell out of the front yard. Here we have no peasants and there is an opportunity for every one.

America, in my mind, has been made what she is by her cosmopolitan condition. She draws from everywhere. All languages are hers. All nations join here, and each brings the knowledge and the views from his own. The Dutch and the Spanish, the Italian and the English, the French and the German, all bring their customs, their habits, and from the friction of all these elements light is evolved. America is especially prone to adapt herself to all sorts of things. Nothing is good enough for her if something better is to be had, and also we must acknowledge that the first results of
this mixture of so many things are many incongruities, yet the general good is sure to come from the apparent chaos. It matters not which of their many tongues, even French, if it is good it is accepted here: while the good thing, over there, will not be acceptable if it comes from antipathic sources. "We have always done this way" is a very good rule.

And not France alone is slow to take a proposed progress. The Anglo Saxons, who would have us think that they lead in every sort of progress, have strenuously opposed the introduction of the metric system, or of the English system in their money, because it was not decidedly English, no doubt, and they stick to their shillings and penceys and yards and pennyweights, while America bravely accepted the metric system, just because she saw that it has been used in her farmhouses and city streets, away 10 years and when you come back none of his implements of cultivation will be the same as 10 years before. He has outprosgest them all.

Even our new spelling reforms show that we are not content to remain stationary. I lately bought a new book, "Newest England," which treats of New Zealand and the wonderful reforms they are making there, faithfully trying co-operation, government ownership, and enough different forms of socialism to scare any conservative. Well, the writer of this book, who seems to love progress, still uses the English spelling—"valuour, labour, neighbour, fav'rous, plough." If we have dropped the useless letters in some of our newspapers, why not keep on improving? Or had we best go backwards and write "myrour" for "mirror"?

But if the Europeans are slow to take hold, there is room for improvement here too. The country is new and we try to go fast—too fast in some things. Our structures are often flimsy, our bridges insecure. Our roads are horrible, our architecture a salamagundi of all ages and styles. With our excellent railroad coaches, we have the most inefficient and expensive transportation. Our express companies' "skin" us to the quick. We need parcel posts such as in Europe. While passing thru Paris, when first arriving in Europe, we had to give out some linen to wash, but could not place it in our baggage. The post office is the only authority for the country. "I will send it to you by parcel-post," said the kind woman. "What, twenty pounds of linen?" "Why, yes, it will cost you 10 cents." And sure enough, we received our linen by mail, 20 miles away, for something less than a cent a pound.

While in Switzerland, a friend loaned me an umbrella, to go some miles in the rain. I ask how I could return it to him. "Oh, by mail!" "By mail!" "Yes, it will cost your 5 cents.

How many of my readers know that we can send a half pound of samples of merchandise to any point in the Postal Union for half as much as it will cost to send the same package to our nearest post-office. Half a pound can be sent to the other side of the earth, to the Fiji Islands, for 4 cents, while it will cost eight cents to send it to the post-office next to your own, in your own county. Yes, yes, America can learn something yet.

The Long-Tongued Fallacy as Applied to Bees.

BY R. C. HUGENTOHLER.

A DMITTING that long tongues in one species of animal life can do wonders in extracting sweetness, and carry it back to the hive, it is not too elaborated as to make it more palatable to those who are fond of this sort of luxury, I am still extremly slow in applying this principle to Apis mellifica. It has been argued with much show of reason that the enormous yields of certain colonies of bees over all others, is attributable to their longer reach of tongue. The micrometer has argued long and eloquently in support of this theory, and the honeyed jury (I dare not say jurymen) have been deeply moved by the long tongue of counsel, and are ready to swallow another tongue, and dish another! It is not yet decided which has the longest tongue.

In order to defend the above theory successfully, it will be necessary, in comparing the results of labor, to have the shorter ended tongues employed in flowers whose chalices refuse to yield up any, or all of the coveted treasures to the short tongues, and willingly bestow it upon the long ones.

In the summer of 1897, when the hills overlooking our town were robed in white, and gusts by thousands sat down to the banquet of the flowers amid a glorious burst of harmony, and drank the health of the same, I had one colony that gathered 140 pounds of nectar, choice enough for the gods. The general establly was 50 pounds. Was the large amount gathered by one colony due to long tongues? I answer no. Can not all honey-bees drain the chalices of white and sweet clover? And even if they could not drain the sparkling cups emitting inviting odors, at what time had they had the chance? What need of cistern-pole when full unto the neck?

Again, in 1899 I had two colonies which gathered 100 pounds—double the amount stored by any of the balance of the apiary. That year,

Smiling May, she promised me that I might smack my lips; But later on green peas were in even shorter supply; And finally, with back to me, as she was going out.

I'll back again next season when time signals thee to rout.

So, sore-disheartened was I; When May's sister came along.

She sang me her sweet-clover song Which pleased my ear and filled mine eye

With joydrops for another year. Until sweet June should reappear.

So melting poetry to prose, we had a fine flow of nectar from a 20-acre field, 1 1/2 miles to the north, which had been flooded by a flood and planted by that handy occupant—sweet clover. Learn of him thy opportunity to watch, and hold on with his might. He, an ardent lover of thin soil, sent his servants on weighty errands after treasure deeply hidden, and which had been carried up, did intoxicate with delight my teeming kingdoms which, when flooding cloud and wind bore down on them, er masse came sailing on low down, till at flood-tide, they filled the main street of our town, scarce over my low head! Fair sight! Well worth a poet's eye.

We conclude then, that the superiority of one colony over many others in amount of nectar gathered, is due, not to the superiority of organs employed, but to superior industry, which characterizes a good colony. In the one, each worker respectively, a particular colony manifested superior results in amount of labor performed because of a superior organ in its individuals, would be manifestly an error. Let us remember in breeding for long tongues to gather a doubtful amount of red-clover nectar (for the meager results from the humble-bee indicate no purple goblets filled), that the characteristic energy of colonies is not dependent upon long tongues, tho they may accompany them. Nature, it seems, in the providence of God, has provided the means by which the new con-"rider between Apis mellifica and the sparkling nectar in the rosy chalice, which, if overcome by the ingenuity of man, would doubtless yield some nectar, but, taking all things into consideration, be undesirable.

Cuban Bee-Experiences—Honey and Wax.

BY GEO. R. O'KONENBAUGH.

T HE rain has been coming down in torrents all day, making one feel like doing something desperate, but instead I came up here on the peaceful mission of writing to the "Old Reliable." On Oct. 10, 1900, I thought I was going to leave Cuba for good, never to see my bees again. I was the most disappointed bee-keeper that ever struck this island, as it was no trifle to lose 475 colonies in 10-frame hives with two supers on each, and one with containing a queen. When I first began to work this sanitary district of the hives were rotten with what I pronounced foul brood, as some of the bees were ship here from Havana city. But I do not now think that it is foul brood, as I tried the McEvoy plan but got a failure. I have by this time pronounced it chilled brood, pickled brood and bald-headed brood, caused by pollen that is poisonous to the brood.

Every colony that I have is very badly affected with paralysis, which is probably also caused by that same poisonous pollen, as their abedous are filled with pollen, and they act as they would in a bad case of constipation. I have tried many remedies, but none proved of any avail.

When I arrived here the second time—Oct. 15th—there were only 170 colonies left, the others having swarmed out, and the hives were badly cut inside with mites. I have extracted about 16,000 pounds of honey up to this time.

AMERICAN BEE JOURNAL

Feb. 28, 1901
I have not been at all successful here in rearing queens on the Doolittle plan.

In "Gleanings in Bee-Culture," T. Smith says that Editor Pender, of Augusta, gives his experiments, and claims that 4 pounds of honey will produce one pound of wax. What a foolish thing to put into print, and how unreliable the statements are. I claim to be one of the sugar-honey experts of the United States, and I will give a more reliable statement as to how many pounds of sugar is required to secrete one pound of wax. I have written the following rule which can be relied upon as very nearly correct, according to my knowledge and judgment.

Twenty-four cubic inches of comb will hold one pound of honey, and one pound of comb honey contains one ounce of wax; therefore one pound of secreted scales turned into comb will hold 10 pounds of honey. Now I am going to contradict myself right here, but let me digress a little. I don't know how it is, but it is a fact that requires 3 pounds of sugar to produce one pound of comb honey. I have had good, strong colonies that have been fed with sugar syrup from June 10th to Sept. 10th—a Heddon feeder kept full at all times—yet I could never make the best colonies store much over 200 pounds of comb honey each.

If that is true, then good comb-builders require about 12 pounds of honey to make 1 pound of wax, and I have had bees that were supposed to be poor comb-builders that required 16 pounds of honey to make 1 pound of wax. At the foregoing one can readily see that producing sugar-honey or feeding "any old thing" to produce wax, does not pay.

Cuba, Jan. 15.

Questions and Answers.

Conducted by

Dr. C. C. Miller, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Edcors.)

Saccharin as Bee-Feed.

Some time ago I saw some remarks about saccharin as a bee-feed. Is it any cheaper than sugar for bee-feed or is it injurious to bees? Where can it be obtained?

Indiana.

Answer.—Saccharin is said to be 300 times sweeter than cane-sugar, but I think you will find a dollar's worth of granulated sugar better than a dollar's worth of saccharin for the bees. You can probably get it of your druggist. It will cost you something like 30 cents a pound as much as sugar. and while you may have as much sweetness in a pound of it as in 300 pounds of sugar, you would by no means have the same amount of nourishment. The amount of carbon would not be present.

A Colony Taken From a Bee-Tree.

I found a bee-tree last fall rather late in the season, and I didn't like to cut it, but I was afraid some one else might come along and not think the same as I did. So the next day after I had a little cool, they took up a march to the hive and got it a little but very much. I was after the bees, so after I cut the tree I got the hive ready to put in the bees. I was very careful about the work. The colony didn't seem to be very large, but after I had an opening big enough to look in, I was very much surprised. In place of the hive, I had to get two wash-tubs and a pail. Such a sight—nothing but honey, and yet plenty of bees also.

After I had all the honey out, I started to coax in the bees, but they were not powerful enough to take the hive full of honey. I got them in once, all but a handful. I thought perhaps the queen was among them, but I could not find her there, and they all came out again. By evening, when it got a little cool, they took up a march to the hive and got more, and very nearly all went in. Some got under the log.

I left the hive until the next morning, when I went back to look after the bees. When I got there they just started to come out, and I closed up the entrance and took them home, and placed them along side of my other bees, and opened the entrance again. They started to fly just as fast as they could get out, for about two minutes, then they stopped. There were plenty of bees then, yet, so I sat down and watched them. Pretty soon, to my great surprise, I saw some of the bees coming back with pollen on their legs.

Now, what I want to get at is this: Do you think the queen is there? Why should they carry pollen, and not my other bees? If they don't, let them out all winter? They seem more noisy than my other bees.

Illinois.

Answer.—Very likely the queen is all right. In any case it is best not to disturb them till spring. Then when the weather is good and the bees are flying about, you can decide whether the queen is present by looking whether there is any brood. If no brood is present it may be your best plan to unite it with one of your strongest colonies that has a queen.

Crowding in New Bees.

I have been keeping bees for six years—just playing it while in the ministry, and so keep only a few colonies. I am wintering 8 colonies, using dovetailed Langstroth 10-frame hives with Hoffman frames. I appreciate your answer to others very much, and so will ask one or two myself.

If a hole were bored in the end of a super with wire-cloth tacked over it—bees would the ventilation be helpful or harmful?

2. Would light entering in be helpful or harmful?

3. Would you advise boring a hole there?

4. If advisable to have a hole there, how large should it be?

Illinois.

Answers.—1. I don't know.

2. I don't know.

3 and 4. I would not advise it.

Now that I've answered all your questions, suppose we sit down and talk over the matter a little. Allow me first, by way of parenthesis, to congratulate you on your good judgment in choosing something so interesting to "play at" while working in the ministry. It seems just a little strange that there is so much difference between this country and Europe as to the proportion of the clergy engaged in bee-keeping. In Germany, practically, a very large number of clergy are leading bee-keepers are clergymen or professors and teachers in schools and colleges. When I say "leading bee-keepers" it does not necessarily follow that they devote their time mainly to bee-keeping, nor that they keep a large number of bees. But in their moments of leisure they give earnest attention to the subject, and are among those who have added most to our stock of knowledge on this most interesting subject. Father Langstroth, who brought about the Langstroth frame, discovered the layering-hive, belonged to the clergy. So does Dr. Dzierzon, who has done more than any man living to advance bee-keeping.

But now to our subject. At one time I was on a visit to Adam B. Carlin, who was one of the leading apiarists of Indiana, and was at the time of his death. He was putting on sur plus boxes (it was before the day of sections), and when he put the hive-cover over the boxes he propped up the back end of the cover something like an inch. As he was propping up one of the covers, he looked up and said in his earnest
way, "I consider that very important." Mr. Grimm did not tell why he thought it important, and I think I didn't know enough to ask him. But I thought he was a safe man to follow, and as I adopted sections very shortly after that time, I began to see that he had been right. When he changed to supers, I provided an opening as nearly like Mr. Grimm's as I could by shoving the super forward so as to make a space of one-fourth to one-half an inch at the back. I found that this work quite satisfactory, for one super with 56 sections was very heavy, and on some other accounts I was led to change to the T super, which I now use. With this I still kept the opening at the back by shoving the super forward. A difficulty that I had before noticed to some extent seemed now to be aggravated. The sections next the opening proceeded very slowly compared with the others. The opening to the outer air at this point prevented the bees from building comb to a considerable extent. So I gave up this opening, closing the box entirely above, relying only on the ventilation from below.

After this change, however, the amount of swarming increased a great deal, making it look as if the ventilation rifle was the cause. I tried to keep on shoving these frames with keeping down the best swarming. Another thing helps greatly to strengthen that belief. For years I have generally had a few colonies that were allowed to have three or more stories, with a large open gap between each story, the combs being used for extracting, or kept as store-combs. I do not remember that on these colonies ever swarmed, and I attribute this immunity from swarming in a great measure to the large amount of ventilation that was thus provided. In the light of all this, it would look as if it would be a good thing to have the ventilation you propose, providing you are working for extracted honey, the air and the light not being objectionable. With comb honey the hindrance to comb-building is less, in the way of ventilation, for the holes are not needed, and the bees will be pretty sure to fill it up with bee-glue. It is hardly advisable to bore a hole in any case, for you can get better effects by shoving the super front or back. This distributes the ventilation, instead of having it all at one spot with the hole.

Questions on Swarming.

In your book, "A Year Among the Bees," which I bought of you in the spring of 1887, you say on page 49, "When it comes time to put on supers, they (brood-frames) are reduced to 4 or 5 frames."

1. Do you still practice this contraction of the brood-chamber before swarming?

2. When a colony swarms do you hive the swarm in a contract brood-chamber before swarming?

3. And if contracted or not, do you use starters or full sheets of foundation in brood-chamber?

New York.

Answers.—1. Alas for the changeableness of bee-keepers! It is not safe to count on anything to-day the same as 15 years ago. Spring, I day, practice contraction now. Up to the time of putting on supers I give all the room needed for brood-rearing, even to two stories of 8 frames each. If the bees will use it. At the time of uncapping, I will put in but 5 of the best frames of brood, if the colony has more, and give it enough to make 8 if it has less. Some would say that is contracting, and some would say it is exchanging room in the super for room in brood. At any rate, my practice is to have each colony have 8 frames of brood at the time of putting on supers.

2. If I were hiving a swarm, I would give it four or five frames of brood to start with, and add more later.

3. I always use full sheets of foundation, of which I do not wish to be sure of all worker-comb. One of the abilities of German bee-keepers, the late C. J. H. Gravenhorst, practiced giving a frame of foundation for each frame with narrow starters, counting that very little drone-comb would be built in, and when they were filled giving enough combs or full sheets of foundation to fill out the hive.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail at $1.00. For the first year at $4.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

The Afterthought.

The "Old Reliable" seen thru New and Unreliable Glasses.

By E. E. Hasty, Sta. B Rural, Toledo, O.

The Bee Keeper and the Bee Supply Dealer.

In "Colorado's" letter and its replies, on pages 69 and 70, we have a first-class rumpus, albeit by no means a new one, and not likely to become a closed incident very soon. How much human nature can see in man when we get him in print once! Man who doesn't like a situation seldom fully appreciated by the man who doesn't like it. Just hear the latter fellow's replies pop off—as he talks of buying a car-load of supplies "right unseen," and a thousand miles off." Not so bad as he imagines." "Do not consider the dilemma of our Colorado friend a serious one." "Very little trouble in getting or giving satisfaction." Ahem! And, in good sooth, if the fellow is plump and candid enough, we rather like him, at least to the extent of a good laugh. "Why should I contribute to make it perfectly safe for my customers to order of my competitor? If I have given them satisfaction, and no cause to complain, let them keep on buying of me." And we get reminded that much of the trouble arises from our own too fierce cheapening of everything we would do well to stop and consider—yes, d's a large amount of considering. First a pinch of "live" and then a pinch of "let live" should go in the peace-pipe which we are to smoke. The two little girls who never squarred reported their secret to be. "Addle lets me and I let Addle." But, as to the manufacturing Addle we don't quite see our way clear to "let Addle" while she is in her present frame of mind. For one thing she doesn't realize what a prodigious lot of mistakes—some annoying, some expensive, some both, but not entirely spoiling the goods— go out to her absent customers. I take it that part of these are scoured about a little, and salved over by a little apology, and the lawyer part never necessary at all. New York.

A Trick the Bees Played.

That trick which Mr. Bauckman's bees played, page 60, was a very unusual one. It is unusual for a swarm to plunder the home hive, and again unusual for a plundered hive to survive and amount to something later on.

Keeping Bees on Shares.

Yes, that's so; the man who is keeping your bees on shares can not be dissimul very well if unsatisfactory. Also, if the season proves so bad as to afford no hope of anything to divide, he might take himself off without saying a word. You think your bees have a keeper when they are totally neglected. Page 66.

So Utterably Uttered, you know.

The Utter case being so "utterly uttered," and all that's fairly utterable being already uttered, I think I'll skip it, and forbear to utter. (Or thusly our bread brandeth butter.)

That German Uncapping Fork.

So Mr. Kvetzinger has an uncapping fork—but does not tell his editorial visitor whether he has ever "made it go" or no. Suspicious circumstance. Motors that never "move" are not as a class a very hopeful class. Perchance the uncapping fork may be the idea of that kind of amateur who wants to lift off the cappings without taking any of the honey—and the amount of time it takes to do it may not appeal to his mind very strongly. Page 68.
Good Prospects for a Crop.

My bees are wintering very nicely. They have a good flight Jan. 23rd, and prospects are good for a crop of honey this year. I think white clover has been damaged any this year.

Worms Destroying Alfalfa.

Bee is in fine condition. They bred up strong in October, with so plenty of first-class stores I expect them to come out all right in the spring. I have a few bees prevented last season after July, but almost nothing earlier. Worms took most of the first crop of alfalfa; I am told that these worms drove at least one family away from their home, crowning up the north side of their dwelling until they were two inches thick on the roof.

Other Colorado people are as much down on sweet clover as I was some years ago when I wrote it down in the American Bee Journal, and got a good drubbing for my doings. I am going to plant two pounds of it on my own land, "just for greens," and chance it. Some of our neighbors say if I do I will rue it.

The bee industry in this country is in its infancy, the understand there are about 4,000 colonies of bee in the county, of which less than a dozen people own from 50 to 250 colonies each, and the balance are scattered mostly among people who are "not experimenting." I have a lot of requests for the future are very bright indeed.

We have lately organized the "Lamar, Colo. Bee-keepers Association," of which your humble servant has the honor to be corresponding secretary. James H. Wing, Publisher, Co., Colo., Jan. 4, 1901.

P. X.—Poganne (Tarloq) got back from Alaska in September, and says he found humbe bees, also manes, carpenter, and tal- or bees, 40 miles above the Arctic Circle. J. H. W.

Bee Keeping in Clarke Co., Wash.

Mr. G. W. Durkee, of Wisconsin, a reader of the American Bee Journal, has sent me a paper with inquiries regarding bee-keeping in this part of the State of Washington, and thinking that many other Washington readers can better afford to be interested, I beg to answer Mr. Durkee thru this medium. The questions are as follows:

1. Are you located near the Columbia River? From what does your main honey supply come? Honey from clover, white clover, sweet clover, and honey-dew? What is your average surplus per colony in a fair season?
2. What does honey sell for? How do you winter your bees? What do sections and foundation cost out there?
3. How do you winter your bees? What are bees worth per colony? Is there any opening for a bee-keeper in Clarke County?

Answers.—1. Yes, on the edge of the highland joining the lowlands along the river. White clover, fireweed, and Syringia are found in the main part of the region, honey is from the order named. We have no honeycomb and sweet clover, but once in a great while we get some honeydew, very rank flavor in it. But in average winters this stuff is all right for stores. Bees have a sufficiency of winter food, having a good flight for more than a couple of weeks at a time.

2. This question I am unable to answer further than what I have stated in my reports in this paper.

3. I have sent the market quotations in this paper for San Francisco, and add to those prices about one cent for comb and one-half cent for extracted honey, and you will come very near the prices that honey sells for at wholesale in Portland, Ore. Of course, if you are not your own salesman you will have to deduct freight, commission, breakage, etc., to get the net prices realized by the producer.

4. I winter the bees in one-story single-walled hives. I put two sticks 3 x 4 x 11 inches, one piece of wire fencing, then a barapu cloth, and one-half dozen double sheets of newspapers and the flat hive-covers of our frames, and the top of the sheetard to keep off the rain. In the coldest part of winter I leave the whole entrance 3 x 12 inches opened when possible, and in February, in the coldest part of the year, in February, I again contract the entrance to about 3 x 3 or 4 inches for an average colony, as I am always kept busy doing business, and have ten or twelve less or very small, they are better able to keep their combs and inside of the hives free from dampness and ice. The bees in keeping up the temperature to rear their young. I have no doubt it would pay in the coldest climate to have the top of the brood-frames than I do, for then so much ventilation would not be necessary so that the consumption of winter stores would not be so great. However, my bees have come thru the winter season in very good condition, and have never used more packing than mentioned above.

5. Sections are high in price. I have a 1901 cases purchased by me, Portland, Ore. In No. 1 sections are quoted $4.75 per 1,000, and foundation from 50 cents per pound for honey to 3 cents per pound for wax, in thin, in 10 pound lots. If you come out here to start in bee-keeping, I would advise you to purchase a frames somewhere, and make your own sections, frames, hives, etc. Lumber is cheap. While we have no bawoo, spruce is plentiful, cheap, and good to make sections from. I have found Oregon and Washington cedar to be the best material I know of for hives and frames. The man with average intelligence can make his own hives, frames, sections, etc., with the saw mentioned above, and even one able to make his own bee-business, even after a poor season, when money is scarce with the bee-keeper. Of course, if you have a little it would be better to purchase the frames and the Bee-Culture, and read the directions there given for making hives, and the proper use of the Barnes frames. I can not grudge, I hope the editor will not object to the special recommendations given to the saw and the book, as I give them for the benefit of bee-keepers, and write from actual experience.

I feel I owe much of my success in bee-keeping to the American Bee Journal, with all its beloved and able writers, that I want to do what I can towards paying a little of the debt.

7. Bees can be bought in box-hives from farmers here at all prices, from $1.50 to $2.50, but of course it is much cheaper to find enough bees in that way to make a reasonably good start, and you will perhaps also have to work more bee-keepers will not sell per colony for bees in one-story dovetailed hives.

There is very little territory in Clark County worth anything for a specialist beekeeper that is not already occupied, but there are good localities farther north and along the Columbia River.

T. H. WAALE.

Bee Cleaning Up Unfinish Sections

As autumn was closing I had 50 pounds of unfished sections. I desired to use these for hives the coming season, I concluded to let the bees empty them by placing them in tiers over the boxes (in same position), and allowing but one bee to enter at a time; but having a rich neighbor owning the square above (in town, on the square also, the very much encumbered), I concluded it would be unsafe to allow him to do box "spying" as he would no doubt win over my kingdom with his own; so I began forthwith the tedious process of unscraping and extracting the contents of the section boxes. After they were all unscraped and tiered about 30 feet to the westward of my western property, I put them on the new bees, and worked them on for some time. I was attracted by the buzzing industry about that hive. Watching with watchful eye the opposite columns, as first one, then the other, gained the ascendency, now peering...

not prohibit him from believing it, the others did.

That bee-keeper who has been asleep for 20 years (page 177, 1900) seems to be wide-awake enough now, and after Prof. Cook. Very good to show how the facts bring out facts. I wonder if he dreamed those things during his 20 years' nap. If so, he is to be congratulated, and is perhaps the only one in the world, for I do not think that the interpretation thereof is sure. My own observations compel me to agree with him in the main, and I have come to the conclusion that to make me think that in the majority of cases an issuing swarm does not know where its new home is, is a mistake, and that in the instances I think they do know where they intend to pitch their tent. Two instances of this, in the case of my notice last week, in which I left for parts unknown. One, after going about a half mile, clustered again, and re- turned. The second, as I have mentioned above, was the same manner, the one was found on a fence a mile or more from the nearest apiary, where it remained two or three days after it was discovered. I do not know how long it had been there before it was found.

On the other side of the argument: Two seasons ago a large swarm of hybrid Italians—the largest I ever saw—left for the woods, and I thought to take them. They started in a direction a little south of west. I threw several pails of water among them with a good sized pump, but they did not retard them from the direction in which they were going, and headed them northwest. I followed them for a mile and a half, but I saw no more of them, tho I was not at all tired! They were now working toward the south. They just a little bit longer, and I should have turned their course again. It seemed to me that they were making for a certain place. I have an idea, but I am not sure. It may be that a prime swarm is more likely to have a future home in view than an after-swarm.

I believe that for some time, the black or German bee is a better all-around bee than the Italian, especially if working for comb honey, in which cases I think our experience is surely more pronounced. It will hardly warrant my expressing views on the subject—that if the same amount of labor and time had been spent improving the black bee that has been spent in improving the Italian. It would be a much better bee for the localities where the season is short, and perhaps especially favorably where the season is longer. I have been trying the Italian bees and the cross for the past four seasons, and so far the black bees have proved superior. But, if there were a demand for bees I should want the Italians for profit every time.

In this county the bees can be put back on the winter stands about the middle of April. If the weather is fine there is usually enough brood to keep up the population. I have been advising that about the middle of June, when white clover begins to bloom; then the main flow is on which lasts about three weeks. Very little swarming occurs before the beginning of the flow. The black, if strong, will usually cast one or two swarms, and then devote their time to storing honey, while the Italians can be depended upon to swarm twice, three times, or even more. In 10 to 20 days the prime swarm can be expected to repeat the performance. I have had them swarm repeatedly before the frames were even filled. I have been unfortunate in the strains of Italians I have seen, but I have had queens from Ohio, Pennsylvania, and Illinois. The strain was swarming, better com-bidders, and work more readily in the sections. It is only to the extent of belief that I think the Italians could be handled so that they would produce as much—or possibly more—honey in this county, but it would require more labor and more satisfactory results in doing this I will tell of it later on.

A. R. BUCHER

Publications, A Mother's Love of Bees, etc.

Poor Season—Wintering Bees.

Last season was a poor one from beginning to end. There were plenty of flowers, plenty of rain, plenty of bees to gather the honey, and a good-sized crop, but there seemed to be no nectar secreted
Langstroth on... The Honey-Bee
Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound handsomely in dark blue buckram and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for $1.25, or club it with the American Bee Journal for one year—for $1.75; or, we will mail it as a premium for sending THREE NEW subscribers to the Bee Journal for one year, with $3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

The Belgian Hare Guide
This book is acknowledged to be the best of its kind in the market. It is complete and practical in all its parts. It is an absolute necessity for the bee-keeper. It follows and explains many other subjects pertaining to the industry: History and Origin, The Belgian for Utility, The Belgian for Fancy, The Basin and its Cultivation, Bees and Flowers, Bees and Hives, Horses and Hedges, Food and Feeding, Feeding Green Stuff, Mating, Rearing, Breeding, Mating, The Hare's Yard, Posture, Scoring Curves and Judging, Belgian Hare Colour, Breeding, Selecting, Inspecting, Divisions and Remedies, Preparing for Exhibitions, Owning and Showing, Capturing, Queries and Answers, Appendix, Register of Pedigrees, The Belgian in England, The Belgian in China, England, and Foreign Countries.

Gentlemen: I have been reared on a number of queens during the past season, which were introduced without a single failure. I think there is no excuse for losing queens this season, if the proper course is pursued, and precautions taken. Always be sure there are no queen-cells and no queen in the hive before releasing the new queen. Some of the caged queen in the hive have been killed or eaten by the bees. I believe in keeping the bees too. If you have a fair number of bees I will sell 1900 a Failure—A Wheat Country.

The past season was a poor one for honey in this locality, I did not get any, and about the only man that did was an old gentleman that took a large Ji nee. I have gathered about 200 pounds of nice white honey; he has a near neighbor that raised alfalfa, and the bees love to go for alfalfa in the summer. I have had a large number of bees this season, and I think it would have been the easier if I had allowed the bees to go for alfalfa. I have been a good many beekeepers this winter, and all report 1900 a poor year, and many of them are very dissatisfied with the bees. We had an abundant rain during the last season, and the weather being cool and damp, the beemakers are going to have a hard time. It would have been better to have a hard time. It would have been better if I had not get a crop of honey. I will sell a part of my bees in the spring, and run what I keep for comb honey.
lieve that the longer the wax is in cooling, and the longer it is in the liquid state, the clearer it is of dirt. Slow cooling might not make any difference in the quality of the wax after it has passed a certain temperature, but fast cooling will almost always cause it to crack, and this I wish to avoid. As a rule, when I extract wax I have quite a lot of it which I pour into large pans placed upon the floor, and cover with sacks and such available material, and it is generally satisfactory.

The honey crop was short in this locality the past season, and white clover was a failure. I have made a practice of stimulative feeding for several years, and I think it pays when properly done. I keep up the feeding and until after fruit-bloom was exceptionally good. After fruit-bloom I began feeding, using the Boardman feeder early in the morning. I continued to feed until within a week of bawsswood bloom when I discontinued, thinking the bees were getting enough from the stores to keep them up until the bawsswood bloom. But by that time nearly all were light in honey, the very strong in bees, and it took the first three days to fill up below. Then the weather became so cold that it threatened frost, and for about four days they stored but little honey. The colony on the scales stored 82% of that being but little fall honey, and October being such a warm month, bees flew nearly every day, using up their stores, so quite a number of colonies were a little light when the time came to put them into the cellar. But we hope for better years to come. I enjoy reading the report of the National convention, and I think all bee-keepers should be subscribers to the American Bee journal.

G. H. FREY.

Linn Co., Iowa, Jan. 10.

YELLOW OR WHITE
SWEET CLOVER SEED
Free as a Premium

For sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us St with a new name for this year, we will mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with $2.00) and get the three pounds of seed.

Address,

GEORGE W. YORK & CO.

144 & 146 Erie Street.

CHICAGO, ILL.

HONEY AND BEEWAX
MARKET QUOTATIONS.

CHICAGO, Feb. 19.—Fancy white comb, $4.10; No. 1, white comb, 120$; No. 1 amber, 180$; No. 2 amber, 185$; No. 3 amber, 200$. Fancy comb and honey, $65$. White extracted, $75$; amber, $65$; dark, $65$. Beeswax, 25c.

R. A. BORNEIT & Co.

KANSAS CITY, Feb. 19.—Fancy white comb, $3.80 per lb. dark, 120 per lb. Light, 100 per lb. Demand fair; receipts light. Beeswax, 22 2/3c.

W. C. CLEMONS & CO.

Successors to C. C. Clemens & Co.

CINCINNATI, Feb. 9.—The market for comb honey is becoming very bare, alike the prices for combs and honey. Old dark selling for 60c no demand for darker grades. Extracted in fair demand; dark comb for better grades from 65c to 1. White clover brings from 95c to 1. Beeswax, 25c.

C. H. W. WEBER,

ALBANY, N. Y., Feb. 11.—Honey market is dull and prices nominal; light stock, but the cold weather is bad for it. Combs, in good condition, not candied, white, 150c; mix, 135c; dark, 125c; white, 105c; mix, 95c; dark, 85c.

H. R. WRIGHT.

BUFFALO, Feb. 8.—Some more active this week, and may close rather better than expected awhile ago. Fancy lapped comb, 150c; No. 1, 130c; No. 2, 115c; light, 75c; dark, 65c. Beeswax, 23c to 25c.

BOSTON, Feb. 8.—Fancy No. 1 white in cartons, 17c; No. 1, 150c; No. 2, 125c; No. 3, fancy. Will not statute on call for dark honey this year. Extracted, 95c; fancy, 125c; light amber, 75c. Beeswax, 2c. No. 1, 13c; No. 2, 11c.

H. B. BLAKE, SCOTT & LEE.

NEW YORK, Feb. 9.—Comb honey is being well cleaned up on our market. The demand has lessened to quite an extent, on account we present, of the high price which has been ruling. Fancy white still brings 150c in a small way; No. 1 white, 130c; buckwheat, 10c; extracted rather dull and not much doing. California white, 100c; white, 85c; dark amber, 70c. Beeswax steady at 25c.

DETROIT, Jan. 19.—Fancy white comb, 85c; No. 1, 110c; dark amber, 125c; extracted white, 75c; fancy, dark amber, 105c. Beeswax, 2c to 25c. No. 1, 12c; No. 2, 10c; No. 3, 8c.

M. H. HOWRY,

SAN FRANCISCO, Feb. 6.—White comb 13c; No. 1, 11c; No. 2, 9c; No. 3, 8c; extracted, 1c. Blackcomb, 3c. Buckwheat, 1c. Beeswax 10c. No. 1, 12c; No. 2, 10c; No. 3, 8c.

Consider the light output of honey last spring coming from California. The prices and over-2/3's are of tolerably liberal volume and are more or less of amber grades. The market is slow at the quotations. It is reported on good authority that a substantial portion of imitation honey is being dealt out in considerable quantities by which accounts in a great measure for the very limited business doing in the past year.

HONEY MARKET.—We may have a customer within a short distance of you who wants your honey, or beeswax, and you have to close with all the markets; therefore we want you to send your information, standing quantity, price, and any other item you want to supply, to the market. We will try to make the business for you at a low price. Reference 12c, $100, 10c for any business man in this city.

GLEANINGS in Bee-Culture...
Is an illustrated semi-monthly, 32 pages and cover,
at $1.00 a year.

If you keep only a few bees you can’t afford to get along with-
out GLEANINGS in Bee-Culture, as it will save many times its
cost the first season. Better get along without almost anything
else than a good bee-paper. There is no use in our telling how
good GLEANINGS is, as it will speak for itself if you will only let
us send you a sample copy for your name and address on a postal.
If you once see it we know you will want it.

Look at Our Offers:
Offer No. 21.
For 25 cents we will send GLEANINGS 6 months’ trial subscription to new
subscribers.

Offer No. 22.
For $1.00 we will send GLEANINGS for one year and an untested Italian queen
valued at $75 cents; but at this low price we reserve the right to send queen some
time in July when we have a choice supply.

Offer No. 23.
For 50 cents we will send GLEANINGS from the time your subscription is re-
ceived till Jan. 1, 1902, so that the sooner you send in your order the more num-
bers you will get.

Offer No. 25.
Gleanings one year and one untested red clover queen, $2.00. Gleanings one
year and a tested red clover queen, $4.00; a select tested red clover queen and
Gleanings one year for $6.00. We will begin mailing these queens in June. Or-
ders are already being entered and will be filled in rotation. Do not neglect to
improve this opportunity and get some choice stock. Send your order early so
you may get the queen correspondingly early in the season.

Offer No. 26.
For $1.00 we will send GLEANINGS one year and a Clark smoker, postage 20
cents extra. Or, for $1.25 we will send the Cornell smoker, postage 25 cents extra.

Offer No. 27.
For $1.75 we will send GLEANINGS one year and our cyclopedia of bees, the
A B C of Bee-Culture, of 412 pages.

Odd as well as new subscribers may take advantage of these
several offers, but all arrears or back subscriptions must first be
paid at $1.00 a year. Refer to these offers by number to avoid
mistakes.

The American Bee Journal

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

144 & 146 Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Matter.

IMPORTANT NOTICES:
The Subscription Price of this journal is $1.00 a year, in the United States, Canada, and Mexico; $3 yearly extra for postage. Sample copy free.

The Wrapper Label Date on this paper indicates the end of the month to which your subscription is paid. For instance, "Dec. 30" on your label shows you paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for any money sent as to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling—The American Bee Journal adopts the Orthography of the following table, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "t" is a preceding sound. Also some other changes are used.

National Bee-Keepers' Association

OBJECTS:
To promote and protect the interests of its members.
To prevent the adulteration of honey.
To prosecute dishonest honey commission men.

The Bee-Keepers' Guide:

Or, Manual of the Apiary.

BY

PROF. A. J. COOK.

400 Pages—16th (1899) Edition—18th Thousand—$1.25 postpaid.

A description of the book here is quite unnecessary:—it is simply the most complete scientific and practical beeook published to-day. Fully illustrated, and written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is feltly equipped, if his library contains without The Bee-Keepers' Guide.

This 16th and latest edition of Prof. Cook's magnificent book of 400 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

GIVEN FOR TWO NEW SUBSCRIBERS.

The following offer is made to present subscribers only, and so premium is also given to the two new subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal, and we will mail you a copy of either the Basswood or Alfalfa Honey, as a gift. Prof. Cook's book alone sent for $1.25, or we club it with the Bee Journal for a year—both for $1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. WILL YOU HAVE one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street,

CHICAGO, ILL.

Long-Tongued Bees

ARE DEMANDED NOW.

One Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year with $2.50, or, one Tested Queen free as a premium for sending us FOUR new subscribers with $4.00.

We have arranged with one of the oldest and best bee-keepers (having many years' experience) to rear queens for us this coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat feather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.

144 & 146 Erie St., CHICAGO, ILL.

20 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 20 cents a pound—CASH—for best yellow, upon its receipt, or 28 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

A sample of each, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Order the Above Honey and then Sell.

We would suggest that those bee-keepers who did not produce enough honey for home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
The National Convention Report is omitted this week on account of more copy not being received in time from the secretary. We regret this second break in the long "continued story," as we desire to complete it as soon as possible.

A Glucose Test.—Editor E. R. Root said at the Wisconsin convention that adding an equal amount of wood-alcohol to honey, stirring well, and then letting it sit for ten minutes, is a good test for glucose in honey. If adulterated the compound would show a milky appearance, and remain clear if pure. This is a simple test, but we presume the wood-alcohol must be absolutely pure itself to start with.

Bee-Keeping at the Pan-American.—At the last Ontario County (N. Y.) Bee-Keepers' convention, Mr. O. L. Herschier, superintendent of the apiarian exhibit at the Pan-American Exposition, said that it was proposed to have a commodious building for the accommodation of beekeepers, that bees alive were to be exhibited in regular yards as kept in different lands; and also that there would be shown articles from bakeries in which honey is used as an ingredient. The New York beekeepers will be allowed to exhibit at least 5,000 pounds of honey, about equally divided between comb and extracted. The island of Cyprus is to be given the space to furnish the packages in which it is to be exhibited. The State will also furnish the cases for the comb honey. All beekeepers in New York, who have any honey suitable for exhibition, should address Mr. Herschier. He will buy the honey outright, which, however, he will not do until the crop is harvested.

Big Yields of Honey.—The Twentieth Century Farmer has been telling a whopper on the 19th century bee-keeping. Here is what it publish recently.

CYPRIAN HONEY. RECORD.

The next breed of bees imported came from the island of Cyprus. They are called Cyprians, a name not always used for bees. The Cyprians hold the world's record for the amount of honey gathered by one colony in a single season. On New Year's Day in 1901, a well-known apiarist, taken 1,000 pounds of extracted honey from one colony of Cyprian bees. This was probably due to a natural fault—they are very nervous, and will defend their store of honey to the death. They cannot be sold—the by-products. But if aroused the way, only to conquer them is with a mild dose of chloroform. On account of their disposition they have not become popular.

Upon receipt of the Farmer containing the above paragraph, we clipped it out and sent it to Mr. Doolittle, to show him what was being credited to him. And here is what Mr. D. says about it:

The above reminds me of the "man who poked up three black crows," of ancient time, while the truth was that "he threw up something as black as a crow," and told his neighbor so.

My greatest yield of extracted honey from a single colony of bees was in 1877, when one colony gave me the large yield of 550 pounds, besides producing enough to winter on—or about 350 pounds more. So that the total gathered by this colony was not far from 900 pounds, which, as before stated, was about what was consumed while gathering, or during the summer months. But this was before any Cyprian bees were imported. However, in 1901, the bee doings of this 900 pounds being those best of all bees, all things considered.

But this record of 550 pounds has been outdone several times. E. Gallup, while in Iowa, went considerably above 600, and F. H. Ellwood, of this State, produced 640 pounds from one colony, if I am correct; while a Texas bee-keeper obtained 1,000 pounds, or a little over, from a single colony in the spring and its increase. This latter I have spoken of in print several times, always crediting the matter to the State of Texas. It would now appear that it has grown, like the crow story, till I myself produced the 1,000-pound yield, and did it with Cyprian bees, but the Cyprian part is wholly "manufactured," for, if I am right, this 1,000-pound yield was produced before any Cyprian bees ever came to this country.

G. M. Doolittle.

Onondaga Co., N. Y., Feb. 29.

That "Uter-"ly Glorious Victory won down in New York State last December grows more glorious all the time. Editor E. Root, in Gleanings in Bee-Culture, has a paragraph editorial with this quoted heading, "But 'Twas a Glorious Victory." Then right under it he gives the following from Josh Billings:

"Sum people that go to law for damages sometimes get more than they want.

After that comes this paragraph referring to the final settlement of the Uter vs. Uter suit:

Just as this form is going to press I have received information that the plaintiff, or, as he is called, Fruitman Uter, has decided not to carry his case to a higher court, and he has settled by paying all the costs, which can hardly be less than $250 or $300. Thanks to the National Bee-Keepers' Association, the defense was so strong that the other side knew there was absolutely no show for them. They were afraid to let him have it, and they were afraid that he knew there would be nothing left of him if he attempted to put up another fight. At the same time it is a sobering reflection to every one of our subscribers who is not a member, Send in a dollar to General Manager Secor, Forest City, Iowa, and have a hand in this glorious work. There are more battles to fight, and you need your help, and you must needs ours.

Yes, Manager Secor ought to be kept busy now taking in the membership dollars. Surely, every bee-keeper should desire to belong to an organization that does such effective work. It is more convenient for the remittance of the American Bee Journal to send their membership dues to this office, we will be glad to receive them and forward to Mr. Secor. We would like to see every one of our subscribers get into the National Bee-Keepers' Association. You can't help in a better way for the uplifting and defense of bee-culture.

The Production of Comb Honey.—Mr. F. Greiner reports in the American Bee-keeper some notes from the Ontario County (N. Y.), Bee-Keepers' convention held last Dec. 13th and 14th. Referring to an address by W. Z. Hutchinson, he gives the following important point:

As soon as it is advisable to put on the honey-boxes or supers, give a super full of drawn comb. This will keep the honey out of the brood-chamber. The hive in general is divided into several empty sections, or such filled with foundation, do not fill the bill here. If the bees are not in the habit of storing their honey above, they are apt to continue thus through the season; when they form a habit of filling the brood-chamber with honey, in the beginning of the season, they then are slow to enter the sections any time after. Mr. Hutchinson said at one of the meetings of the bee-keepers that a rush of drawn comb a case of honey was gained above what other equally as good colonies had made supplies with empty sections.

The swarms are treated according to the Heddon plan. Mr. Heddon has gone a good deal of experimenting with swarms, hiving them alternately on combs, foundation, and starters. The combs always give the poorest results with him, and the foundation, aside from insuring perfect combs, proved a total loss. No young swarm is allowed more than five Langstroth frames or one section of the Heddon hive. Contraction is confined only on the swarm.

He has come to the conclusion that it is not always profitable to supply the bees with foundation. During a good flow he claims wax is produced professor anywhere, and if there is no opportunity to use it somewhere a large portion of it is lost. And, after all, he exprest his opinion that good, strong workers-combs were not too dear at the expense of the foundation.

A Looking Glass placed before the hive entrance is advised in the Leipziger Bienenschau, to scare away robber-bees. Perhaps it is thought that if the robbers could "see themselves as others see them," they'd quit their meanesses.
A Successful Roof-Apairy in Chicago.

BY G. E. PURPLE.

To relate 'my experience in keeping bees in the city, and how the idea occurred to me to keep them on the roof, I will have to be our friend, or a few.

Like a great many others, my boyhood days were spent on a farm. When a boy 16 years old my father took some bees to keep on shares. It was not long before an interest in the little creatures was aroused in me, and I became quite a student of their ways, studying them as best I could while using a box-hive. After keeping them about two years in box-hives, having the usual failures one has when he works with them blindly (one may say), I secured a copy of the "A B C of Bee-Culture." I began reading it and could not bear to drop it until I had read and reread it all thru, and from that day to the present time my enthusiasm has not abated. Not being blest with an over-abundance of time, I got thru with that number of hives and colonies, by the next season I had all the bees in movable-frame hives. I had six or eight colonies at the time. Let me say here that before this we had returned to the original owner his share of the bees, so all we had then were our own.

The next two seasons were very favorable ones, and by the end of the second we had 30 or more colonies and succeeded in getting over 2,000 pounds of honey from 20 colonies, an unheard of amount in that country (northwestern Missouri).

The next three or four years were either entire failures or on very little surplus. Having a very good position outside the city it was impossible for me to abandon the farm and beapos;fatherapos;s care. Father all this time had left the care of the bees entirely to me, and when the responsibility fell to him he was little prepared for it, and consequently the bees were more or less neglected, and gradually dwindled. During my stay in Minneapolis I made the acquaintance of persons who kept bees, and we spent many an hour talking over our experiences, and enjoying ourselves as only enthusiasts can.

Owing to the financial disturbances of 1893, I found it necessary to change my residence from Minneapolis to Chicago, and have lived here since. While riding home from work one evening I saw a man on a car reading the "old reliable" American Bee Journal. Of course I knew he was a bee-keeper, and knowing all bee-keepers are jolly good fellows, I ventured to speak to him, and he proved to be our friend Mr. Mead, I afterwards called on him, and we together examined his bees. I learned they did not disturb his neighbors, and that there were many nectar-yielding plants in the vicinity. That call revived in me the "bee-fever" again, and I determined to get one or two colonies as soon as I could I find a place to keep them.

Soon after that I moved farther out, and while on the roof one day I thought it a capital place to keep bees, and the next spring I sent down home for one colony, and tried it. The colony father sent was not a very good one, so I bought two frames of brood and a queen from Mr. Mead to build them up. They did far better than I expected, produced three frames of honey and shipped to the extractor that season. The bees wintered well on the roof, pack in planshavings, and the last spring I sent for all there were left on the farm—only four, and one was dead when it arrived. I started them out four good, strong colonies. That summer they increase to seven, and I got an average of 150 pounds per colony.

In the fall I moved to the present location, and the following winter (1898-99) was very severe on the bees. The location is an open one, surrounded on all sides to their stores, and one colony died with plenty of honey in the hive. Only two came thru strong, and four were very light. We had a very early spring, and I never before saw bees build up so rapidly, so by the time the honey flow came on, they were all good and strong. But it was the first season I ever had reason to complain of my luck: I lost queen after queen, both old and young, and only increase 50 colonies, these producing over 900 pounds of honey.

The next winter, not having them fix properly, I lost two, and doubled others up. I started with five of my own, and bought 10 more, increased to 21, and produced nearly 2,500 pounds of extracted honey. The engraving shows the very one Saturday in August, when Editor York called with his photographer, and took our pictures after we had (as an old friend says) "climbed Jacob's ladder to the bee-heaven." (See first page).

When one keeps only a few bees, more for the pleasure than the profit, and does not have the work connected with them at odd times, he can keep close watch of each individual colony, and get better results in proportion to the numbers than with a large apiary, and they will amply repay him for the little outlay in the start, and for the time spent in taking care of them.

The roof as a place to keep bees has its advantages as well as disadvantages. Things in its favor are that the bees are up out of the way, and there is no fear of their disturbing any one. (I have never heard any complaints against mine). The roof being nearly level, and covered with clean gravel, there is nothing to hinder the bees, and when they swarm it is easy to find the queen. (I clip all my queens). While the drawbacks are, getting every-thing up there, as well as getting the honey down to ex-tract and handle, and some days the wind blows so hard that the bees can scarcely get to the hive at all. Many think it quite a novelty, but the novelty has worn off with me, and I derive a great deal of pleasure as well as profit from my bees, tho' kept on the roof of a modern flat-building in a big city.

Feb. 1, 1901.

[We might add to the foregoing that Mr. Purple's honey source is principally sweet clover. His apiary is located about five miles west of the Lake, and is a very neat one. He reaches the roof thru an opening directly above one end of the porch at the rear of the third flat in which he lives.

Mr. Purple is a very pleasant gentleman to meet, and thoroughly understands bee-keeping. He would be successful almost anywhere with bees, provided there was plenty of nectar for them to gather.]

We spent a delightful hour at his roof-apairy, and were surprised to see how abundantly the bees had rewarded his efforts during the summer.—EDITOR].

A Review of "A B C of Bee-Culture."  

BY PROF. A. COOK.

I have been a pleasure to review "Dadant's Langstroth" and "Cowman's Honey-Bees," as there is so much to commend and so little to criticize in these volumes, each of which is a credit to our nineteenth century bee-culture. They are books which deserve to live and which will live. I come to the pleasant duty of reviewing "A B C of Bee-Culture" with no less of gratification. Without doubt this book has exerted a wider influence upon the bee-keeping world than any others ever written. Even its rivals can only be joyous in its extensive sale, as they know that wherever it goes it goes to help and to bless. I am the more pleased to do this, as I have received several letters thanking me for the reviews of the other books. These reviews certainly call attention to mooted questions and will be almost certain to incite criticism. I shall criticize no book except in such a manner as to give good reasons, I believe that there is an error, but it is quite possible that in some cases I may be in the wrong.

Page 2—Mr. Root says, "Candidly, I don't know any better way to prevent second swarms than to watch carefully when they are about to form, and act on them, climb tree, etc., until they are gotten safely into the hive." I believe that the experienced bee-keeper will rarely be troubled with second swarms. One is enough for the west results, and some of the many ways and, should be used to prevent the second swarms. I think the way first suggested by Mr. Heddon is certainly the best. The principle of this is in placing the new swarm close beside the parent colony, and the day before the second swarm would be expected remove the old hive to another part of the apiary. Of course, the older bees will go back to the old location, to join and strengthen the swarm, while the old colony will be so thinned out that very rarely a second swarm will
issue. I used this method for years and with no failure, so far as I knew.

Page 6—Is not Mr. Root a little too enthusiastic regarding alfalfa honey, when he says "the quality of alfalfa honey is probably superior to anything that the world has ever seen or produced," and his "claim to be something of a judge of honey, and I think alfalfa is no better than clover, linden, sage, and I think I might find even others quite equal to it."

Page 7—In California it does not take three years to get bees established. All Root says further that alfalfa, at any rate, the maximum yield the very first year in the later cuttings. Alfalfa is a wonderful crop. I often say that I think I would rather have a good alfalfa field than an orange-orchard, because I have known several cases where the oranges must have been made at a second hand, and it is not uncommon to secure two tons per acre from a cutting. In this same connection, Mr. Root hints that there is so much sweet in alfalfa that the bees even gather (see) from the dry hay. This is nothing at all. Even I do not think that too much can be said in favor of alfalfa for it is a marvelous crop.

Page 10—Mr. Root says that digestion is the separation of the nutrient part of the food from the non-nutrient, and the conversion of the nutrient into a liquid fit to mingle with the blood and thus nourish the body of the insect. This is given as a question but he was not happy in his selection of authority. Digestion is simply the process of feeding. It is the process of rendering the food osmotic. Many authors say that digestion is merely to dissolve the food. This is not a good definition. Some of the food that is already dissolved, like sugar, is absorbed by the bee, but must be digested before it can be absorbed from the stomach into the blood. That is before it is osmotic. Absorption, not digestion, does the work of separation. One other of our bee-books makes this mistake.

Page 11—In speaking of the urinary tubes appended to the stomach, Mr. Root calls them "the malphigian tubes." It should be "malpighian," as they were named from their discoverer, Malpighi, a distinguished Italian physiologist and microscopist. Mr. Root further says that "it is not certain what their office is, but it is thought that they are the uriniferous organs." This is no longer true as area, etc., have been found in these vessels, so we now know it to be a function of kidneys.

Page 12—In speaking of the advantage of black bees, from the fact that they can be shaken off the comb so easily, Mr. Root says, "For that reason alone some prefer them, or hybrids, to pure Italians, which can hardly be shaken off. One very fine method to shake every Italian bee from the comb if the latter fully fills the frame. This requires a peculiarly sharp jerk which every apiarist should learn to give. He should also learn to keep the frame perfectly vertical else the comb may fall over and the honey is a little lost. Moreover, my honey in the apiary. I should make this characteristic a count against the black bee and in favor of the Italian. As our best men love their homes so well that they always stick to them if possible, so I prefer the bees that endeavor to stick by their comb.

Page 35—Mr. Benton did not spend the best years of his life in the jungles of India, in search of new bees. Mr. Benton was in India only a few days. I think he was only a few days in Ceylon, when he first saw A. dorsata, which he adds was " angi nee.

Page 45—It is not uncommon that our authors use the term worm and grub as synonymous with larva. I know this is commonly done but it is wrong, and how shall we correct errors unless our authors avoid them? Entomologists confuse the term grub with other larval forms of insects. Worms are not insects at all. Worms, as instance in the angeworm, never have any legs at all, and look essentially the same from first to last except for size. All marine insects have legs and are very different from the larva, or insects, which we are after discussing. Why always speak of the immature bees as larvae and be correct?

Page 49—It is here stated that it is supposed that this larval food is pollen and honey, partially digested by the young or nursing bee. I wish others with positively proved that this food is a larval food and not digested pollen, without the addition of honey. Planta has shown that the drone-larvae have mixt with this food toward the last a little undigested pollen.

Page 50—The Premiums offered this week are well worth working for. Look at them.
Management for Producing Extracted Honey.

BY C. DAVENPORT.

For the last seven or eight years I have run from 30 to 40 colonies for extracted honey, and intend this season to have 50. I found, and I will prove, that there is no plan or method on which they will be run, and this method might not answer for some localities, it is the one that will work here, I believe, and secure the most surplus with the least work.

It is generally claimed and conceded that it requires less work and skill to produce extracted than comb honey. I have not found this to be altogether so. If I had for the last few years I should have been producing extracted in a much larger way, and would do so now. The first reason given for comb honey is that the bees mix the liquid form, it seemed to me that it required fully as much, if not more, work as to produce first—class article of extracted honey, as it did fancy comb honey. But I have learned enough about this branch of our pursuit since, so that I can now produce extracted with considerable less work than comb.

Now the question may occur to some, why I started and kept on producing extracted honey, if, with, me, it required and for what reasons I will still do it and produce comb honey. There were a number of reasons for this, and two of the principal ones I will explain. One was that there was a local demand for extracted honey, at a better price accordingly to the price of comb honey. I had, and have at present, a still larger number of customers for extracted than comb honey in the extracted form, many of them preferring it because it is cheaper—infact. I have a good many customers who use a large amount of extracted honey every year, pay a good price for the price of comb honey, who would buy very little if any comb honey, because they could not—or at least believe they could not—afford to. Others actually like it better in the extracted form, and again some who are very fond of comb, and of course these should be allowed extracted honey very little about comb honey. Personally, I much prefer it in this form to comb honey.

I used to extract a large amount of honey from the brood-chambers late in the fall, then feed sugar syrup for winter stores. At that time there was a good profit in doing this, and the bees seemed to winter fully as well on granulated sugar, as it was then made, as on natural stores, and the honey thus obtained, tho it might be somewhat mixed, was always thick and rich. But the price of our product dropped so low that there was no longer profit in producing extracted honey in this manner, tho I had a trade for it already worked up—a trade that, as I have explained, would not take comb honey in place of extracted.

Another, and more important reason, was that about that time, I had given up to the idea of extracting honey. My opinion I became convinced that more money could be made from a large yard by running part of the colonies for extracted honey, for here a range may be overstocked during the swarming season. I know that there is not enough bees to gather whatever nectar there is during clover and basswood bloom. This is not the case every season, but on an average it will hold true two seasons out of three, and a colony that is being run for extract are they can gather considerably more nectar than one being run for comb honey, for these reasons: A larger number of colonies can be profitably kept in one yard if part of them are run for extract, than could be done if they were all run for either comb or extract, for extract. After carefully repeated experiments, some of which I have described in these columns, I know, if I know anything about bees at all, that more extracted honey can be secured here if the question is put the same, one of the colonies is larger than the 10-frame. The reason for this is, that with a larger brood-nest an immense force of bees are reared out of season, to be producers, but are, instead, consumers. I know of no other reason why a colony could have been ridiculed by some, but here it is a more important matter—one that to ignore may mean the loss of a number of thousands pounds of surplus honey with a large yard, can be shown, because that is an amazing assertion to make, and that it is likely to be disputed by some of our readers. They might be, in our ranks, but it should be borne in mind that I make this claim only for my own locality, and for others where the flows are similar to what we have here, relatively to the season.

It may be of interest to the newer readers of this journal, for me very briefly to go over the experiments I made to find out whether it was more profitable to allow more than one story for a brood-nest. These experiments extended over a number of seasons, with slightly varying results, owing to the varying conditions of the seasons, as well as that of the bees. But without any exception they all showed that a two-nest here can be so large that it would reduce the amount of surplus extracted honey that could be obtained; besides, these large brood-nests, especially the unlimited ones, entailed much more work to get what surplus there was, and to reduce or get the bees into one story again for winter.

My method was, each spring, to select 30 or 40 colonies as nearly equal in strength as possible, and divide them into lots of 10 each. The queen in one lot would be confined by one story, and the second season, I would allow two stories for a brood-nest; while the queens in the third lot were allowed their will in 3 or 4 stories. Some lots were in 10-frame hives and some in 8-frame, and, so far as I remember the last five years, I have always found that queen reared, then made but little difference either way. But with the plan I now practice, there is considerably more swarming where the queens are allowed 10 frames than there is when they have only 8 for a brood-nest. When the queens are allowed two brood-chambers there will be here, in a good season, about half of them that will swarm, and some seasons as large a percent of swarming will take place when the queens are confined to 10 frames; but with only 8 frames for a brood-nest there was no swarming. As a result, it has been less with me the past two seasons. It is true that both seasons were poor ones, still there was enough honey gathered so that nearly 30 percent of the colonies that had 10 and 16 frames for a brood-nest swarmed, or tried to do so, for another winter. (Southern Minnesota.)

To be continued.)

Longer Tongues and Larger Bees, Etc.

BY ADRIAN GETY.

Bees with longer tongues is the topic of the day. Measure the length of the tongues of the different colonies of bees and select for breeding those with the longest-tongued bees, if I can use that expression.

To begin with, the exactness of the measurements given by Mr. Ernest Root and a few other experimenters. It seems to me that the difference between the tongues measured is too great. There is hardly any difference in the size of the bees and in the different organs and parts of them; and I don’t see how the tongues could make such striking exceptions, the measurements varying between 13-100 and 23-100 of an inch. The tongue of a bee is very near as elastic as a man’s tongue. How could a tongue exactly 30 or 32, or 59, or 86 to the inch—can change its length, width and shape in all sorts of different ways? And it is nearly so with bee-tongues.

The method employed to measure them, is to chloriform the “subjects,” which makes them extend their tongues, and measure them with calipers. But what proof have we that they all extend their tongues to the same extent? None at all.

Again, there is a considerable difference between the length of tongues of the different bees of a colony when measured by the above-described process, and even admitting that the measurements are correct we can measure only a few bees—say 20 or even 50 out of at least four or five thousand bees of a colony. We may have measured not only the shortest or the longest, but we may have measured in another, and failed to reach the proper average length, or rather maximum length, for this would be the important item to obtain.

I do not say that this method of measurement should be discarded, but I think necessary to have some indirect way to check it, and ascertain to what degree the bees of each colony can reach for the honey in the flowers. For we know that there is no greater bee than the one which can reach the furthest; it is the one which can reach the furthest, and the one which can reach the furthest is the best. It is simply a trough 4 or 5 inches long and not more than 1/4-inch wide inside. The top is made of wire-cloth thru which the bees can suck the syrup. The depth is from 1/4 of an inch at one end to nothing at the other, forming an incline. A scale on one side shows the transverse marks in 25 parts graduated from 0 to 25, commencing at the end where the depth is nothing. To use the instrument, fill it with syrup or thin honey thru the wire-cloth. Place it in an empty super on the top of the brood-nest or the super that may already be there, being sure that it is level. This can be easily done by placing it so that the syrup comes even with the wire-cloth over the
whole surface. When the bees have taken all that they can, not even without disturbing the instrument—to which division the syrup reaches. If it reaches, for instance, to the 17th mark, it shows that the height of the bees, or rather the distance from the wire-cloth to the level of the syrup, is 1/100 of an inch, and since the division corresponds to a depth of 1/4 of an inch that is 25-100.

This instrument will give a depth or length of tongue rather too long, as a portion of the bee's head above the tongue may go through the wire-cloth, but from a practical standpoint, it is immaterial whether we get the exact length or not—what we need to know is the comparative length, or in other words, which bees can reach the deepest. If several instruments are used, and the results to be compared, it will be necessary to use the same kind of wire-cloth on all, for the reason that a greater part of the bees' heads could go thru a larger wire mesh and enable them to reach deeper. The instrument should be constructed accurately, waxed up, and kept all polished to prevent the wood and possible distortion. Care should be taken that the wire-cloth should lie evenly all over, and for that reason the instrument should not be wider than 1/4 of an inch, otherwise it would be difficult to prevent the cloth from bulging in the places. When coming from a depth to a precision of 1/100 of an inch, the instruments used must be accurately and carefully made.

LARGER BEES FOR LONGER TONGUES.

All other things being equal the largest bees should have the longest tongues. And to have the longest tongues possible, it will be necessary to have the largest bees possible. In fact, the main argument presented in favor of larger race of bees is their presumed ability, thru a longer tongue, to reach the nectar of flowers too deep for our present race of bees, especially the red clover.

There would be another advantage in having larger bees. That is, less lost space thru the wood and coming from the fields. Suppose you had a pile of materials to remove—say 2,000 pounds—and want it carried to a distance of 500 yards. If you employ a man able to carry only 50 pounds at a time he will have to make 40 trips—that is, walk a total distance of 20,000 yards. If you take a man able to carry 100 pounds at a time, he will have to make only 20 trips, therefore to walk only 10,000 yards. It may take him as much time to load and unload his 20 loads as it takes the smaller man to load and unload his 40 loads, and he may not walk any faster, but even then, he would be ahead of the time necessary to walk thru 10,000 yards. So it would be with larger bees—they certainly would lose less time in going and coming.

EFFECT OF COMB FOUNDATION.

A few years ago the question was asked, "Has the size of the foundation any influence on the size of the bees reared in them?" To my surprise nearly all the "wise men" answered, "No, none at all." And yet it is self-evident that no bee can be larger than the cell in which she has been reared, for the simple reason that all her growth is done when she emerges, and her skeleton already formed and too hard to expand any. The abdomen and other soft parts can and do expand some after the emergence.

All the above-mentioned "wise men" knew good and well, that the bees reared in worker-cells are much smaller than those reared in larger cells.

Before foundation was used there was quite a difference between the different races of bees in regard to size. There was a race of black bees in Holland much smaller than the common German bees. The Carniolans were distinguish by their large size. Among other figures we have some of Cheshire giving the weight of 20 Cyprian bees at 28 grams and of 29 Carniolans at 40 grams. We don't hear any more about a difference of size, now.

Why so? Just because foundation of a universal size is universally used—5 cells to the inch—and with a uniform size of cells has come a universal size of bees.

The first step will be to use a larger size of cells. But that is not sufficient. The size of bees will not increase at once, simply by giving larger cells. It will be necessary to select the queens giving the largest bees, and keep on breeding for the largest all the time. One drawback will be that with a larger size of cells there may be an over-production of drones. The only way to prevent it would be to increase the size of cells, at first of only a small fraction, and later, when the new race is established, make another increase.

Several years ago, a distinguished French apiculturist, Mr. Droy, gave a number of queens only drone foundation. A number of them reared worker bees in those sheets, but some others only drones. I have not the details of the experiment. Judging by what has been done with horses, dogs, fowls, etc., we might think it possible (and perhaps it is) to create a race of bees even larger than the Apis Dorsata. We shall name it (if it comes) "Apis Americana." "

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[TThe Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Enron.]

Plan for Comb Honey and Increase.

1. What do you think of the following proposed plan for comb honey and increase?

The staple honey-plants for this locality are the wild red-raspberry, and buckwheat. Build colonies up as strong as possible even to the point of swarming, for the raspberry bloom, then divide by taking the queen, and put three frames of sealed brood, from the parent hive, place them in the new hive with a couple of frames of foundation, and place the new hive on the stand of the old one, removing it to a new stand and in the course of 24 hours introduce a Carniolan queen. We have here forage for bees at all seasons; basswood is not sure for surplus. The present bees are Italians, which we mean to keep up, the only object in putting in the Carniolan being the repelled proliferness.

MICHIGAN.

ANSWER.—Your plan and your surroundings are so much out of the line of my experience that I do not feel very competent to answer. However, I am not very much afraid of doing harm, for sharp eyes are ever on the watch to correct such devices, and I am thankful, for I well know that eyes may be very sharp and at the same time very kindly.

Your plan is evidently intended to obviate swarming, and if you do it well it might not be successful in general. A more severe depletion might be needed, and I should advise trying at least some colonies by leaving with the queen on the old stand not more than one frame of brood, filling up with frames of foundation and brushing the rest of frames removed. Then two or three days later take away their remaining old frame of brood.

If you have never tried Carniolans, it might be well for you to holy giving them to that part, so as to compare their work with that of your other bees.

A Beginner's Questions.

1. Where can I find the queen-cells? Also tell me other things which I, as a beginner, do not know.

2. Is buckwheat a good honey-plant?

I hope soon to purchase "A B C of Bee-Culture, or "Langstroth on the Honey-Bee." Which is the better for me?

MISSOURI.

ANSWERS.—1. From the way in which you ask the question, it is possible that you think there is a cell in the hive that the queen keeps for her own, perhaps retiring to that cell every night to go to sleep. So far from this being the case, it is true that after the young queen emerges from her
cell she never enters it again, and it is not a great while after she leaves it until the workers tear it down all but the base or enough to make a concave hemisphere. If you look into a hive at this time of the year, it is not likely that you will find a queen-cell in it, but you will be likely to find quite a number of cell-cups, some of them the remains of queen-cells from which queens have issued, and some of them cups that the workers have started and never finish, and most of them they never will finish. If you look into a hive at the time a first swarm issues you will find 5, 10, 20, or perhaps more queen-cells with young queens in them, and they may be in any part of the hive. Generally they will be found near an edge of a comb, possibly right among the worker-brood near the center of a comb where there happens to be a hole or an irregularity. Sometimes you may find a queen-cell not on the comb at all, but built directly on the wood of the end-bar, but this is very rare.

You must excuse me from attempting to tell you all the other things that you as a beginner do not know, that is, if the list of unknown things is as long as my list was when I was a beginner. I could tell you of this journal to contain the answers to all the questions I had, but most of the desired information can be obtained from the excellent text-books we now have.

2. Buckwheat is one of the best honey-plants. It does not yield the best honey, for the honey is very dark, and most persons do not like it so well as honey of milder flavor, and yet some prefer buckwheat honey to any other. It is, however, a somewhat fickle yielder, one year yielding an abundant harvest and the next yielding nothing.

3. If you get either you will have a treasure, and will find in it so many good things that you will wish you had the other also, with Prof. Cook's excellent work added.

---

Introducing a Queen to a Colony that has Just Swarmed.

I would like to know, just after a swarm issues, how to give the old or mother colony a laying queen.

**Wisconsin.**

**Answer.**—Give the queen in an introducing-cage, and there may be no trouble without any further attention. It will be safer, however, to destroy all queen-cells in the hive.

---

Putting Bees Out of the Cellar at Night.

Is there any objection to putting bees out of the cellar at night?

**Wisconsin.**

**Answer.**—There is probably no difference between putting bees out at night and putting them out the following day. That is, if you are sure you will put them out to-morrow, you may put them out to-night. But you cannot always be entirely sure at night that you will want to put them out in the morning. For the weather is sometimes so changeable that between night and morning the temperature may sink so many degrees that it will not be safe to have the bees out. When you have been in the cellar all winter and are put out-doors, they are not as prudent as they might be, and will fly out in weather when large numbers of them will be chilled and be lost. If you could be sure of good weather the next day, it would be all right to take out bees at night, but on the whole it is more prudent to take them out when you know they can fly with safety within ten minutes of being taken out.

---

Uniting Colonies and Introducing Queens.

1. I have some colonies which I wish to unite. When do you consider the best time in the spring for doing it?

2. Which plan is the best?

3. Would it be advisable to introduce a new queen at the same time?

**British Columbia.**

**Answer.**—1. If you intend to unite colonies in the spring, it may be safely concluded that it is because the colonies are too small to supply all your wants. If you can unite two colonies, each having bees enough to cover two frames of brood, they ought when united to be able to cover at least a little more than four frames of brood. At all events, when the two are united you will have six frames of brood sooner than you would have done if you had kept the two separate. So you can easily see that you will gain nothing by wait-

ing, and the sooner the uniting is done the better. Unite before the bees begin to fly, and there will be less danger of the bees of the removed colony going back to the old place.

2. There is little danger of fighting if you alternate the hives with their adhering bees, first a frame from one hive then a frame from the other, and so on. If you unite before the spring flight, there is little danger of trouble if you simply put one set of combs in the hive beside the other. In any case if you see any bees doubled up in the death struggle on the bottom-board after having been stung, or any other sign of fighting, give them smoke till they promise to be good, as Mr. Root says. If they get bad again, smoke them again.

3. Yes, you can introduce a queen at the time of uniting if you kill the other queens, although on account of the greater difficulty of getting queens in spring, and the greater cost, very few queens are introduced in early spring.

---

**Excellent Alfalfa Honey.**

I have mailed you a sample of honey that I think to be first quality, and would like to have your opinion.

**Utah.**

**Answer.**—I have no quarrel with you for calling it first-class. It is very white indeed, and almost very mild in flavor, like all alfalfa honey, what flavor there is excellent.

---

**Convention Proceedings.**

**Report of the South Dakota Convention.**

**By E. F. Atwater.**

The annual convention of the South Dakota State Beekeepers' Association met at Yankton, Jan. 25, 1901. More than half the members were present, and all were very enthusiastic, considering the past poor honey season.

Many interesting points were brought out in the discussions; a short talk by Daniel Danielson, was especially interesting, his subject being "Migrant Bee-keeping." Some years there was a good profit in moving bees from one locality to another; in other years it would be a loss, as the honey-crop can not be foretold. In moving bees they should have an abundance of ventilation, and the haling should be done at night, when possible. Cold water should not be thrown on the hives to facilitate their movement. They should be moved in perfect condition, without loss of energy or numbers.

President Thos. Chantry called attention to the real necessity of maintaining our organization. Our association protects its members, as we have joined the National Beekeepers' Association in a body. If all the State beekeepers' societies would join the National in a body it would be a great help to the National in its great work of fighting adulteration, and protecting the beekeepers of this country. All the beekeepers of the State should get in touch with the State association, as by doing so they get full protection from the National also. Many of our members have saved several times their membership fee, in buying their supplies thru the association.

A paper on foul brood—that most destructive of bee diseases—was read by E. F. Atwater. By special request, the Rev. Dr. Matson, formerly of Ohio, spoke briefly on the "Home of the Honey-Bees," and of the members of the Root family. His address was very enjoyable.

E. F. Atwater was made Association foul-brood inspector for South Dakota.

At the evening session J. J. Duffack gave a report of the great National Beekeepers' Convention, at Chicago, bringing out very prominently the great need of a suitable National pure-food law.

The paper by Mr. R. A. Morgan, formerly an extensive Wisconsin bee-keeper, touched on the value of honey as a food, its wonderful keeping qualities as compared with butter and other foods, the causes and processes of swarming, and queen-rearing.

Mrs. John M. Downer spoke of the convention of the Horticultural Society, at Sioux Falls, S. D., and of the grow-
The Vermont Bee-keepers' Convention.

By M. F. Cram.

The 26th annual meeting of the Vermont Bee-keepers’ Association was held in connection with the Vermont Horticultural Society, Dec. 6, 1900, at Brandon, under the auspices of the Brandon Grange, which furnishes hall, lights and music.

The meeting was opened by Pres. R. H. Holmes, and praying was done by Rev. H. L. Leonard. The minutes of last meeting were read and approved. The Secretary’s and Treasurer’s reports were read and approved.

Pres. Holmes’ address was delivered without notes, and as the secretary is a shorthand reporter, he caught only some of the more important points. Mr. Holmes said that Vermont produced 1/27 as much honey as California, wherever the honey is mostly extracted, but Vermont honey is mostly comb.

What Vermont lacks in quantity she makes up in quality. Vermont leads the country in quality of horses, butter, apples, maple sugar, and raspberry. Vermont had 87% of all the honey in Vermont, but he thought honey could be produced in other places at a profit. The public were not informed in regard to the method of producing honey, but were learning. People have to learn to keep bees, just as any other business, in order to make a success of it. There is no luxury that people like more than honey. Honey is something that would keep—need not be sold until the producer is ready. Altoh the last two seasons have been poor, bee-keepers are not discouraged. We should have better seasons soon. Eternal vigilance is the price of success. We are met to tell each other of our success and failure, and the points of interest in our pursuit.

A discussion followed on the peculiarities of the past two seasons. Mr. Leonard said Rutland County had had better seasons than Orleans, but the past two seasons had been very poor, 1899 being the poorest season without any exception for 50 years.

The past seven years have been poor for honey-production. Mr. Cranche of Lamoille County said that the poorest season he ever knew—about every colony in Addison did well. Mr. Leonard had had seasons when his colonies averaged 100 pounds each, but they had not done so for the past seven years. We have made great strides in the management of bees, the last 10 years.

Mr. Larabee spoke about the bees building comb when the season is dry; also that the bees catch the comb more readily in dry seasons than in wet ones.

Mr. Cranche said that the class of flowers would produce honey one year, and the next year they would not, but some other would take their place. The past season was the best for 40 years, then fruit or apple bloom.

Mr. Terrill, from Lamoille County, said that bees did better last season than in 1899. He got no basewax honey tho it bloomed full.

M. F. Cram then gave his method of getting a crop of honey in a poor season, which was in reality the same as in good ones. The first thing he did was in the month of July the year before, and that was to see that each colony was put, and he advised in such cases to have a hive well stocked with bees in September or the first of October. He could not let his bees swarm later than June and get good results from them the next season. There was generally a honey-flow some time in the season, and in his locality it was usually in June. He had his colonies strong early, or he got left.
The Afterthought.

The "Old Reliable" seen thru New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

THREE "WIVES" IN ONE HOUSE.

Of course we are Schmidtens with diet to know how
three queens to one colony are secured, page 71. Was the
information withheld on purpose to make us cry for it? We
may see that there are three stories and three entrances. I'll
guess that the mid-story has zinc both above and below, and a
partition across the middle. But then, but then: it's one
thing to show us how to have three wives in one house without
any quarrel, and quite another thing to prove that such an
establishment is wise or profitable. I can see that a queen-
breeder might like to have an excess of tested queens to draw
upon.

WANTED--A NONBUSTABLE HONEY CAN.

But, Mr. Atkin, I don't want to speak well of a honey-can
that will burst unless we wait for the honey to candy before we
ship it. I wish that list is in an item that will come between
liquid honey to market. First you know, we shall learn the art
of keeping our honey liquid pretty much all the time. A
nonbustable can will not offend at all your lovers of the granu-
lated articles--not your Mr. Boon. You know what it tel-
lem in a box. Mr. A. is right on the main point, however.
Make your plan and your price according to your situation,
and don't be bullied out of it by the brother who has a fancy
trade, and who wants you to try the impossible task of bring-
ing non-fancy goods up to its lines. If you want your honey
cleaned daily on the poor man's table, you must compete (to
some extent) with home-made sugar syrup. If you can see
your way clear to do without the poor man's custom, why,
that is your privilege. Page 71.

BROOD-COMB 25 YEARS OLD.

Editor Root's account of the 25-year-old comb is reassuring,
and also just what we might expect. Presumably the ex-
tra thickness at the bottom is more or less mixed with dried
food. I strongly suspect that bees in winter supply themselves
with a small amount of nitrogenous food by chewing these
dried masses—one reason why old comb winters better
than new combs—and also the origin of the little heaps of fine
stuff we see on the hive-bottoms. Possibly in a land where
there was no winter the bottoms would continue to thicken.
Even with us an occasional colony does better in cells
with black-looking waxes in place of the comb in place of the
a solid mass. That may be much more common in Europe
than here. Page 74.

ENTRANCE-FANNING AND QUEEN-FINDING.

And so it is not at the side where fanning bees are, but at
the other side that we are to expect the queen. I made
and propagated a very natural mistake: so now let us get
our heads level on the subject. By the way, Mr. Neal's
work on queen-finding was misunderstood by a beginner-
ly colony does. In their cells with black-looking waxes in the
bees do not force air into a hive: they fan it out, and other
air follows in the easiest route. May it not be that it is not
the bees but the queen that determines this whole little mat-
time. With a current of air, doesn't like it, and directly
goes elsewhere. Page 76.

HOW MANY BEES DIE IN WINTER.

On page 88 a beginner asks how many bees die in winter:
and Dr. Miller sagely answers, "A whole lot." This suggests,
for more than the thousandth time, that we greatly need some
common agreement as to what we mean by "the winter."
Most of our chunks of wisdom are more or less reduced to
fog by the indefiniteness of that term. If we mean a season
A colony of 16,000 bees might get thru December, January
and February with a loss of only 1,000—and yet "every
man of them" die before May 10th. In this case one man
would say, "Only a small proportion of my bees died in the
winter:" and another would say, "The winter killed 'em, all
dead as nails:" and both these men would be telling the truth.
Can't we fix things, brethren, so a man can tell a lie when he
tries? We seem to have farre winters. The greater one be
when daily flight ceases, say Oct. 10, and ends when they
begin to build up in numbers, say May 1st. (One bad winter
I noted that May 6th was the lowest point with my bees.)
The lesser winter is of course the three months usually design-
ated three-winter months. Then there is another intermediate
sort of winter which has its beginning Dec. 1st, and its end any
where the season and the speaker may happen to put it—usu-
ally at the warm spell which brings in the first pollen—some-
times in March, and sometimes in April. Somebody tell us
what we would better do about it.

Good Report--Bee-Hive Incubator.

I started in the bee-business last spring with
11 colonies of bees, and put 26 into winter
quarters, and 13 of these are wintering all right.
I sold three colonies during
the summer to an old bee-keeper, and got
about 300 pounds of honey all in one-pound sections, which I sold in the home market at
15 cents per pound.

My bees are all well-behaved. I bought
some queens last summer from some of our
noted queen-breeders, and I don't see much difference between them and my own.

I am going to try using the bee-hives as incu-
ators the coming season. My father used to
tell me not to try to raise kings, and in the end they were hatchet," so I will not say how
many I will have.

We have had nice weather up to yesterday, when we had a big storm. I cannot get along
with the American Bee Journal.

And the story goes on by W. KREMER.

Adrian Co., Iowa, Feb. 4.

Queen-Rearing.

Mr. Priggen's article on queen-rearing
(page 201, 1900) is very interesting and im-
portant to every bee-keeper even if not in the
queen-rearing business, but unfortunately I
can say with "Apsi Mellifica" (page 476, 1900),
that I have read it and reveal it 50 times, per-
haps, hoping to make it stick, it still
Greekin to me. "Apsi Mellifica" complain

only of one passage, but the whole last page is almost a dark cloud to me.

What a splendid gift Mr. Doolittle has in being able to explain his ideas so clearly and logically. It would seem that he has a clear understanding of the subject and is able to communicate it effectively. I wonder if the author has considered organizing his ideas in a more coherent manner, perhaps by grouping related points together. It might make the text easier to follow and understand.

THE CRY OF HARD LUCK IN CUBA

It seems very strange to me that although we had previously written about Cuba being full of fruit and birds and all sorts of fine things, yet the writers of these articles have not taken the trouble to settle the theories with the practice. One of my friends who had seen Cuba firsthand has to say it is a very hard to reconcile the theory with the practice. Another who has recently published the following article is in Cuba: it is hard to believe the writer is not exaggerating.

friends not to come here, yet I have just received news from some 'trimmings.'

Some time ago it was stated in the Bee Journal that a subscriber had made a successful smelt of 300 colonies from the States, but in a more recent number he hints darkly at "disseased bees"—yet he has 352 more healthy than the way here. And so it goes.

The representative of one of the big bee-supply houses spent a vacation here, and sold thousands of hives, tho we are all out crying that we cannot make bee-keeping pay at the present prices—25 cents for each bee. The only reason I see for this is that we feel the profit to the colony is so small that we must have a great many of them to make it pay.

As a result he just returned from a trip over the north coast. We went for 30 miles thru almost virgin forests, looking for good locusts, and found them. We are very pleased at the picking.

The scarcity of good locations is another reason why we have 300 bee-hives in Cuba, Febr. 4.

HARRY HOWE.

A Fair Report for 1900.

Last fall I put 65 colonies of bees into the cellar in good condition, and secured 1,500 pounds of combs, honey and all. It all went to the home market at 15 cents per pound. I got no increase.

The weather was very dry the forepart of the season, as much of the honey was gathered from fall flowers.

I keep the queen's wings clipped, so I do not lose any swarms, and know just how old the queen are. I make $100 to $800 out of 100 bees every year, and I get 150 colonies.

I recommend the American Bee Journal to all who keep bees.

GEO. H. ABRINE.

Bee's Will Die of Starvation.

The past season, in this locality, was a total failure, and I had to feed nearly all of mine for winter. I know of no one else in this locality who fed the bees, and the report is that about five colonies out of every six will die of starvation.

HARRY BROWN.
Richland Co., Ohio, Feb. 15.

Cleanliness Among Bee-Keepers.

I notice what Mr. Abbott has to say on page 55 in regard to cleanliness on the part of the honey-producers. I can verify his statement so far as some of the California bee-keepers are concerned. I think if we would all be more particular in preserving our homes for market we would receive a much better price.

We have just had the best rain in 10 years.

Feeding Bees Grapes—Introducing Queens.

I have been asked how to feed grapes to bees, so will here give my method.

I crush the grapes, best I can, then put them in a large pan, tipping one end a little higher than the other, and having the pulp on the highest end; in the lower end, I put some grass, or something of that kind, so that the bees will not dwell. After they have taken all the juice, they will gradually work the pulp "down hill."

Having a few more queen-cells than I want, I crushed them and added cut out, put them in a pasteboard box, making a few holes in it for air, put it over a strong colony, with a queen-withdrawing board beneath it, and soon disposed of all about it. When I finally thought of it I found that the queens had hatch, and the bees were tearing away the pasteboard. Since then I have many times used pasteboard for introducing queens.

I once put pulp containing even or eight

Vegetable Gardening Free—No book ever published has been more popular nor of more practical value than "Vegetable Gardening," written by Prof. S. B. Green, of the University of Minnesota. It is now used as a textbook in the Minnesota School of Agriculture, in Northwestern Dakota, Iowa, Virginia, Massachusetts, and in the Illinois and Ohio Agricultural Colleges. We have received a copy of the special edition of this book, issued for the Ames Plow Company, which comprises 492 pages, more than 120 illustrations, and treats of "the cultivation of vegetables and their diseases" most ably in America. While the regular price of the book is 75 cents, the Ames Plow Company is offering it free to every prospective farmer. A copy of a Matthews New Universal Seeder in any of its various models, is sent by post at the request of any reader who will use the seeder, together with an ample supply of the best seed, most suitable for the locality. A free illustrated catalogue will be sent on request.

The Modern Farmer, July, 1898.

Do Bees Select their Future Home Before Swarming?

While wrestling with "la grippe," I have had plenty of time to read the Bee Journal, and I was wondering to what extent a bee, or for that matter not bees select their future home before swarming. I believe that first swarms always do—second swarms not only select their home, but if it is a tree they clean it out before taking possession. In 1871, while hunting in the woods near Utica, N. Y., I discovered bee going in and out of a hole in a hemlock tree, and supposed I had found a location for future use with others. The next morning to cut down the tree; it was a sultry morning in June, and before cutting down the bee box they were up and when we arrived there it was quite cloudy. We could not see any bees about the tree, but it was decided to cut it down. As soon as it fell we rushed to the hole to stop it up so that the bees would not get out and sting us. (We commenced using our rods and smokers in those days.) To our surprise we did not see a single bee. We sat down on the log and rested under the sun and got the sun out bright and hot, and while eating and discussing, and wondering what had become of the bees, we heard a report sound overhead, and on looking up discovered a swarm circling where the tree formerly stood. After awhile they settled down on a limb near our box and we put them in a box and took them home with us. We always went then, as now, prepared to carry away the bees. We cut down 13 bee trees the past season, and left seven which we did not have time to cut.

In 1855, near this place, I found a swarm in a red oak tree about 25 feet high. We went the next day to cut it, and found the bees working in and out. As soon as the tree fell we rushed forward to stop the hole, as was usual, but only a few were coming out, and these soon disappeared. We cut the tree open and found the bees were cleaning out the place, and getting ready for

Three Great Potatoes. Among the catalogs we have recently received, that of Mr. Olds of Iowa, is a very substantial volume, the well-known potato specialist of Clinton, Wis., Mr. Olds has catalogued and grown potatoes for 14 years, and makes a specialty this year of three great potatoes; the "Dutchman," a splendid variety introduced for the first time last year; "Potato Pintree"—introduced in 1899, one of the very earliest to be marketed; and "Giganteus"—the best of all early potatoes. This variety is marked by its large size, the best for sowing, and the lowest prices on potatoes, seed corn, oats and other grains, beans, potatoes, turnips, clover plants, clover seeds, and other seeds. Do not fail to send for the catalog. It is free. Mention the American Bee Journal when writing.
Bees Needing a Flight—Propolis on Sections.

Bees have been confined to the hive for quite a long time. They had some small flights over their own hives, two or three days, and then, I think they are needing a general flight pretty badly. The weather is cool again today, and think they may be basking in the sun on the ground. I would like it if I could find some way to prevent the bees from depositing too much pollen near the section-holders. Who can tell? — Edwin Bevis.

Decatur Co., Iowa, Feb. 20.

Bees Wintering Nicely.

I put the bees into the cellar the latter part of November, and did not see them again until the last of January, when I found them to be as active and well fed as could be, and the hives were clean and all right. I took the bottoms off, and found the bees clustered below the frames—by W. C. Le Ferre.

Mild Winter—Overstocking.

Up to this time the winter has been so mild that most colonies have consumed about all the stores and the hives are in good condition. For the first time I have been able to maintain the bees in the case with hybrids and crosses, especially.

The question of overstocking will be settled around this time. If there are a large enough number of frames, prohibiting the keeping of bees within, or one-half mile from, the city limits, went into effect Jan. 1st. Several bee-keepers have moved out, and I have about 350 colonies in all.

We have only a light flow from fruit-bloom in February and the prospects for white clover are not very bright. I believe in scattering 10 cents worth of honey-secreting clovers or clover seeds over every colony, we have a splendid show, when started, will spread with amazing rapidity.

J. C. Wallenmeyer.

Vanderburgh Co., Ind., Feb. 7.

Paper-Bag Feeders.

In reply to Mrs. Sarah J. Griffith (page 621, 1900), as to using paper-bag feeders, I will have to admit that I have never tried the scheme myself. I can sympathize about a little. My first trial was a failure. I poured 5 or 6 pounds of syrup into a large paper-bag, tied the top and placed it on top of the frames in the evening. During the night the bag burst, but there was very little loss, as the hive was raised. I have experimented with a silk paper three or four small bags that would hold about two pounds of syrup. I then oiled them and placed them on the frames. I tried puncturing them on the sides, near the bottom, and when I looked at them I found that the bees were empty, the hives had the holes, and were running around inside of the bags. That’s all I know about it. They might be all right for feeding a colony that was light in stores during the summer or fall, if very heavy weather conditions. —J. H. Metcalfe.

The Swate Fields av Ny York.

There's many a field in Ny York that don't have F.L. Field's, an' many a thim do have swate-honey fields, and do be likin' swate things and altho' ye are a poor American Ba Jurnal jist, an' have not enuf to spate kingli' an' swatly when they have anything to say. The best thing Ould Doolittle end do (as he's on the turf) wad be to tuckle on Dooboombin, an' go at wanst, froze or no frozen. I'm tellin' ye, this is a swate clover, an' let the hawen swate it up a bit wid flyin' over an' blawin' their swate breath. Be a poor swate bruth, an' want the Daddys av Watters we do be glad to have Ould York shok the Ba Jurnal every wavy, and when we do it, we'll fetch the piper, and whin good we do be glad to have the Ba Jurnale come an' chur' swate up the tolme culm, when we enuf swatness enuf from it to pay, we'll pay shawt's doo, an' wid a good by an' God-speed, quikly, quikly. Wil good wishes—e a Ould Ny Yorker.

Carroll Co., Iowa, Feb., C. E. Morris.

Report for 1900 Rendering Bees Wax.

The past season was a very good one in this locality. I secured about 200 pounds of comb honey from 16 colonies, spring count, and interest only. They all have plenty of stores for winter, the hives averaging over 50 pounds each when put into the cellar. What honey I had to spare I sold in the home market at 25 cents per pound.

I will give my experience in rendering wax from old combs. I pounded and rubbed the wax out until it was quite soft, but when it became pine sawdust, then I weighed the crumbly combs, and found that I had 14 pounds; this I dumped into the boiler, put into large and small, hours, the water being changed twice, and some of the dirt was taken off by skimming. I then added 20 pounds of water, and boiled it for some time, then I took it from the stove and squeezed it. I repeated this operation three different times, until the wax was extracted. The 7 pounds of comb made 40 ounces of clean wax, or 57% wax.

The 7 pounds put into the solar wax-extractor, and left in the hot sun at a temperature of from 90 to 100 degrees for about 19 days in making 15 ounce, or 18% wax.

The slumgum was taken out of the extractor and put into a thin cloth bag in the hogshead, and left in the sun for a week. The slumgum gave 28 ounces of wax, or 22% percent. This shows that a great deal of wax is lost from the extractor, and that the white clover from winter-killing.

Care of Plants in Spring.

In the springtime when plants are making strong and rapid growth, particular attention must be given to training them. If neglected in this respect they soon get beyond control, and the only way to bring them into subjection then is by sacrificing a good deal of the growth and making the tree use his time and energy to doing if the training is begun in the right way, and at the right time. If a branch is al-

The convention will be held in the Bell Hotel, 19th and Market streets, and will close on Saturday morning, April 17. The American Bee Journal will be the official organ of the convention. The program will include a number of interesting papers and discussions, and a large number of beekeepers will be present. The convention will be open to all beekeepers, and is expected to be a great success. Please plan to attend.

Liberal Discounts to the Trade.

$2,000 in Cash Premiums.—This is one of the striking propositions presented to the reader of the seed catalog issued by T. B. Mills, of Rose Hill, N. Y., who has been advertising in our columns for some time past. We have just received one of these catalogs, but space will not permit of a brief review of it. Without hundreds of our readers already know Mr. Mills thru their dealings with him in the past, and to such we do not need to change his acquaintance in a business way; we can only say—send at once for one of his catalogues and see for yourself. It embraces everything in the way of standard field, garden and flower seeds, as well as many novelties in each of these lines. The cash-premium proposition relates particularly to the new variety of clover, the Pan-American, which is being introduced by Mr. Mills this season. It appears he is sending free to a certain number of farmers 2-bushel lots of the seed, the only condition being that a certain portion of the crop is returned to him, and all receiving seed under the above conditions are allowed to compete for the cash premiums, which are many and very liberal. In connection with this same offer, is a free pass to the Pan-American Exposition, which will open at Buffalo, N. Y., this year. We feel sure the remarkable generosity of these offers will interest a large number of our readers. The catalog is free. Send for it today, and in writing please mention the American Bee Journal. Ask Mr. Mills also for his new lettuce proposition by which another pass to the Exposition is to be awarded.

Gleanings in Bee-Culture...

Is an illustrated semi-monthly, 32 pages and cover, at $1.00 a year.

If you keep only a few bees you can't afford to get along without GLEANINGS IN BEE-CULTURE, as it will save many times its cost the first season. Better get along without almost anything else than a good bee-paper. There is no use in our telling how good GLEANINGS is, as it will speak for itself. If you will only let us send you a sample copy for your name and address on a postal if you once see it we know you will want it.

Look at Our Offers:

Offer No. 21. For 25 cents we will send GLEANINGS 6 months' trial subscription to new subscribers.

Offer No. 22. For $1.00 we will send GLEANINGS for one year and an untested Italian queen valued at 75 cents; but at this low price we reserve the right to send queen some time in July when we have a choice supply.

Offer No. 23. For 50 cents we will send GLEANINGS from the time your subscription is received till Jan. 1, 1902, so that the sooner you send in your order the more numbers you will get.

Offer No. 25. Gleanings one year and one untested red clover queen, $2.00. Gleanings one year and a tested red clover queen, $4.00. A select tested red clover queen and Gleanings one year for $6.00. We will begin mailing these queens in January. Orders are already being entered and will be filled in rotation. Do not neglect to improve this opportunity and get some choice stock. Send your order early so you may get the queen correspondingly early in the season.

Offer No. 26. For $1.00 we will send GLEANINGS one year and a Clark smoker, postage 20 cents extra. Or, for $1.25 we will send the Cornell smoker, postage 25 cents extra.

Offer No. 27. For $1.50 we will send the A. B. C. of Bee Culture, of 675 pages.

Odd as well as new subscribers may take advantage of these several offers, but all arrears or back subscriptions must first be paid at $1.00 a year. Refer to these offers by number to avoid mistakes.

THE A. I. ROOT CO., Medina, Ohio.

GEORGE W. YORK & CO., 144 & 146 Erie Street, are headquarters for ROOT'S BEE-KEEPERS' SUPPLIES. Send to them for their free Catalog.
MR. O. L. HERSHISER,
Superintendent of the Apiarian Exhibit at the Pan-American Exposition.
Long-Tongued Bees ARE DEMANDED NOW.

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported herself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—"first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash paid for Beeswax. ** This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow wax, low, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa's extracted.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 95 cents per pound; two cans, 9 cents per pound; four or more cans, 5½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt.

Order the Above Honey and then Sell It.

We would suggest that those beekeepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
The Home Circle.—We begin this week a new department of the American Bee Journal, called The Home Circle. As will be noticed, it is in charge of Prof. A. J. Cook—a man of excellent ability, wide experience, and a most helpful writer. We trust that this feature of the old Bee Journal every member of the family may be greatly benefited.

It will be a nice practice to gather all the family around the fireside, and have some member read aloud the whole of this new department each week. As each paragraph is read it could be discussed or commented upon very helpfully by father or mother, or the older members of the family, and thus pass a most entertaining hour or evening.

We hope, also, that many will avail themselves of the invitation which Prof. Cook extends to all who can do so, to aid by sending to him contributions of general interest and helpfulness as may be thought suitable. Of course, all such may not be deemed available, but doubtless a goodly proportion would be approved.

It is not our intention to allow "The Home Circle" to trespass upon the space usually devoted to bee-keeping, but we shall likely run a few of our own advertisements, and devote the space thus occupied to matter that shall be of real value to every member of the family, whether interested in bees or not. We feel that in so doing we will be advancing the good of all, and thus be extending the influence of the "Old Reliable" in a way that will be commended by every one who desires to see it fulfill its highest mission.

We bespeak for both Prof. Cook and "The Home Circle" a cordial reception by every family into which the old American Bee Journal has already won its way.

Home-Apairy of Mr. E. J. Baxter.—On page 121 will be found a picture of the home-apairy of Mr. E. J. Baxter, of Hanceoce Co., Ill. Mr. Baxter is a native of Newark, N. J., but he has lived nearly all his life in Hanceoce Co., Ill. He is a son-in-law of Mr. Chas. Dadant, and for the past 23 or 24 years has kept bees on a large scale, having from two to four apiaries most of the time. He uses large hives, and extracts the greater part of his honey. In reply to enquiries as to how he has increased the production of his honey, he says:

"The book containing my honey-crop statistics previous to 1896 is misplaced, but I can give you my exact returns for honey sold since that time, and some approximation of previous crops. The past five years have yielded me as follows: 1896, $825.40; 1897, $482.42; 1898, $607.50; 1899, $354.69; 1900, $482.30. The average number of colonies I have kept during this time has been 225. The past five years have been about the poorest, the last being the worst of all.

"My best years were 1888, 1889, and 1899. In 1886 the bees averaged me over $10 per colony nett, but I don’t remember the exact amount.

"In 1891 an apiary that I established at Powelton, of 41 colonies, yielded 25 less than 23 barrels of honey, one colony yielding 660 pounds. I believe that the total for that year was in the neighborhood of 25,000 pounds from 125 colonies, spring counting.

"In 1890 I harvested something over 35,000 pounds for my own share, besides the one-fifth that I gave to the persons on whose grounds the out-apiaries were located. All but five barrels was clover honey, and netted me over $2,500."

"Our crop is clover, heartsake, and Spanish-nipple. As to the strain of bees, I have blacks, Cyripus and Italians. The Italians have always done the best, in poor seasons usually having plenty of stores to winter on if no surplus, while the blacks are on the verge of starvation.

"I have used Langetroth, Simplicity, and Dadant-Quiny hives, and the latter having given me the best results, I have now no other kind. Until the past year I have done nearly all the work in the several apiaries kept during extracting time, when I have the usual crew of 12."

Mr. Baxter is also a large fruit-grower. He is one of the firm of Baxter Bros., who own several large vineyards and extensive strawberry beds. Their shipments of strawberries, raspberries, grapes, etc., amount each year to over a hundred car-loads; but E. J. Baxter says that his bees have brought him more profit, for the time involved in their care and the capital engaged, than any other enterprise in which he has ever been.

Making an Observatory Hive.—One of our subscribers in the State of Washington asks us to give plans or directions for building an observatory hive. Also the best location to place it for observation; and he wishes to know whether such can be purchased from bee-supply manufacturers.

Of course, anything in the bee-line can be gotten from the bee-supply manufacturers, if they are told just what is wanted.

Almost any one who is handy with ordinary carpenter’s tools can make an observatory hive, something after the style of an ordinary hive. Both classes of hives, for complete observatory, would be made for only two brood-frames, tho they are often made for one frame. Then the frame or frames can be lifted from the hive with the bees, queen, etc., and put into the observatory hive.

If we were going to keep bees in an observatory hive we think we would have it at the window of one of the living-rooms of our house, having it so placed that the bees could work in and out just the same as if they were outdoors, but have it so arranged that they could not get out of their hive in the living-room.

Apiculture at the Pan-American.—As we have announced before, Mr. O. L. Hershiser is the live superintendent of the apiarian exhibits at the Pan-American Exposition, which opens in Buffalo, May 1, 1901, to continue six months thereafter. Here is what he has to say in gleanings in Bee-Culture regarding the proposed exhibit in the interest and representative of bee-keeping:

Judging from present indications the apiarian exhibit will not be least among the many novel and instructive attractions. It promises to establish and every thing to the utmost, notwithstanding the general shortage in honey-production in many localities within the United States and Canada during the past two years.

This exhibit will be a veritable wonderland, not only for apiarists, but for that larger class of users and consumers of honey. It is designed to make this exhibition educational as well as entertaining, to the end that the fallacies affecting the pursuit of apiculture may be, as far as possible, rectified.

A model apiary will be in operation to show, in a practical way, just how both comb and extracted honey are produced. Exhibits, showing the relation of bees to horticulture, will be a prominent feature, and the mistake of spraying fruit-trees when in bloom will be demonstrated, as well as the absolute necessity of the presence of bees during the season of bloom in order to make horticulture, in any sense, a paying pursuit.

Vast quantities of both comb and extracted honey, prepared in the most attractive and appropriate forms for market, will be shown. It is safe to say that this most interesting feature of the exhibit will include the numerous products of all valuable honey-plants to be found within the Americas and the island possessions of the United States.

There will be a complete and exhaustive display of manufacturers therefrom.

A distinctive exhibit of honey-plants, as a part of the general outdoor-growing horticultural and floral exhibits, is contemplated.

There will be several larger apiary exhibits of apiarian supplies, comprising specimens of all approved hives and every tool, device, and preparation needed in the pursuit of apiculture.

Several State and Provincial exhibits are already assured, and others are under advisement. It may also be stated that individuals, no matter where situated within the Americas, have an opportunity to
exhibit their apiarian manufactures and products. One person in this class proposes to install an exhibit comprising a carload of 30,000 pounds of comb honey, and it is expected that there will be others of great magnitude, especially from localities noted for large productions of honey, as is the case with the alfalfa of Colorado, the sage of California, and the basswood of Wisconsin. Many of these, as well as some State exhibits, will be of the present season's honey harvest, and will not be installed before the middle of July to the middle of August; but application for space should be made early, in order that it may be provided.

It begins to appear that Mr. Hershiser is going to try to oudo the combined apiarian exhibits at the World's Fair in 1893, and the Omaha Exposition in 1898. We hope he will succeed. He is a hard worker, and deserves every encouragement in his huge undertaking. Surely, his objects, as stated above, are highly creditable, and, if carried out, ought to help to elevate bee-keeping and the products of the apiary to a higher plane than they have occupied before in the estimation of the public.

The American Bee-Journal is ready to do all in its power to aid in making the apiarian feature of the Pan-American the most entertaining and educative of any to be shown.

"Watch the Bees"—Robbers.—A subscriber at Ackley Station, Pa., wrote us as follows Feb. 18th:

I enclose a clipping from the Farm and Home. It is a good thing we don't depend on farm papers for our bee-information.

The clipping referred to reads as follows:

W A T C H  T H E  B E E S.—Be sure they have food enough. This can easily be determined in the spring by weighing them. The stand should weigh at least 75 pounds. If they are not supplied dissolve white sugar in water, enough to make a thick syrup, place in shallow pans and put immediately in front of stand on warm sunny days. Watch for robbers if this is done. Your own swarms will not rob one another, M. H. A. E., Coos Co., N. H.

When it comes true that "Your own swarms will not rob one another," it will no doubt be true that two roosters will not fight if they belong to the same owner, and there will be no possible chance that one dog will catch a bone from another unless they belong to different owners. There is, however, a serious side to this matter. In some cases a man will be punished who pretends to practice medicine without proper qualification. He must know enough about the laws of health to be able to instruct his patients as to their health, or he is guilty of crime. Altoho less in degree, is it not of the same kind when a journal ostensibly gives instruction upon agriculture, and knows nothing about the matters it treats of? If a physician is subject to punishment when guilty of mal-practice, why should not an agricultural paper be punished for the want of mal-practice in its instruction? Farm journals should give reliable instruction as to bees, or let bees alone. It says in the clipping that the "stands" should be lifted, and should weigh 75 pounds! If a "stand" weighs 75 pounds, how much should the hive, with bees and combs, weigh?

Mr. A. L. E. DIBENE, of the A. L. Root Co., has recently been in Cuba, and gives a report of his operations in the cuban bee culture. It seems he visited some box-hive apiaries owned and managed by natives. At one of these he desired to take some photographs, but the Cuban bee-keeper didn't quite understand the kodak act. Mr. Dibene continues:

When I went to the lower end of the yard to snap my kodak he came bounding up, gesturating wildly and talking vociferously. The bees were getting roused up at this point; and as I did not understand his Spanish, I concluded that he was afraid I would get stung. Being a Bee-man myself, I knew his motives and with my chances, and so held my ground until I had made two exposures (both failures, however), and then went back to the upper end of the yard, where the rest of the company were. When I got there I found I had offended this man very much indeed, for he thought I had come with some sort of music-box to entice his bees away. It is reported that he lost a large number of bees a year or two ago in this way; and he is very suspicious of anything which he does not understand. We tried to explain the matter to him, but did not succeed in pacifying him.

Editor E. R. Root has the following paragraph in Gleanings in Bee-Culture, with this heading. "York's Patent Double-Acting Bee:" 

While we were on the cars en route to the Wisconsin convention, Mr. Root poked fun at Mr. Hutchinson and myself on this matter of measuring bees' tongues. Mr. Rankin, you are aware, measures the whole and gives a report of his operations in the cuban co. Bee culture.

When Mr. Hutchinson and I were discussing which was the right way, Mr. Root facetiously remarked that he had a plan that was better than either; and that was to measure from both ends of the bee's tongue to the end of the sting. There could be no confusion if we measured thus. And he proposed, further, that Hutchinson and I go into the business of building a double-acting "both ends" at one time, something like a patent double-acting double-plunger pump.

When these two editors have queens for sale of the double-acting kind of bees, we will give them a free advertisement. Only we hope they won't develop long stings at both ends, also.

Mr. H. T. GIFFORD, of Brevard Co., Fla., we learn from Mrs. F. F. PRANGE, "was shot Feb. 16th by C. D. Reed, a renter. There had been some dissatisfaction about the crops, it seems, but no heated words for over three weeks. Reed used a shot-gun loaded with No. 4 shot, fired without warning, at a distance of 10 feet. Mr. Gifford was wounded, and was pumping water for his horse. He saw Reed when he aimed, and threw his head and body behind the pump and platform. This saved his life, but he was badly wounded." Mr. Gifford is one of our subscribers, being 62 years old, and most highly respected by the residents of Indian River district in Florida, as well as in his native State, Vermont. We regret very much to learn of this very unfortunate occurrence, and trust that Mr. Gifford will fully recover.

Not a Bee-Hive.—The following is told at the expense of an American gentleman who was recently staying with his wife at Hotel Cecil. On their first evening there he happened to retire somewhat later than her spouse. Arriving at the door of what he imagined to be his room, and finding it locked, he tapped and called, "Honey." No answer came, and he called again more loudly, "Honey." Still he got no reply, and becoming somewhat uneasy he shouted the endearing term with his full lung power. This time a reply came, and in a male voice: "Go away, you blithering idiot! This is a bath-room, not a blooming bee-hive!"—London Express.

Yellowzones is the name of a valuable tablet remedy gotten up by Dr. W. R. House, of Detour, Mich. They are intended for the alleviation of all fevers, headaches, coughs, colds, grip, rheumatism, neuralgia, colic, dyspepsia, heart diseases, etc. We have tried this remedy for some of the troubles mentioned, and find it all right. We would advise our readers to send to Dr. House for circular and further information, if interested. In seeing this notice in the Bee Journal, should you write to him.

Mr. R. W. LEARY, of the Leary Mfg. Co., called on us Friday, March 1st, when on his way to visit Wisconsin bee-supply dealers. We didn't think he seemed the same man from home years ago, for he said he felt better than for some time past. He is taking things easier than formerly, saying he doubted if he would ever again work as hard as he did for some years. Nice thing to be able to 'low' up, we presume, and let others worry over business, etc.
Convention Proceedings.

BY DR. A. B. MASON, Sec.

(Continued from page 133.)

THE SECRETARY'S REPORT.

During the past year no complaints have been made to me by any of our members of any trouble in obtaining payment for consignments of honey, but the case to which reference was made at the Philadelphia convention last year has not yet been adjusted.

In 1899, Mr. W. C. Gathright, one of our members in New Mexico, made a small shipment of comb honey to Mr. H. P. Robie, of Sioux Falls, S. Dak., and failed to get his pay. Mr. Robie wrote the ice cream, and I got a reply. He promised to pay, but waited a little time. After waiting a long time I wrote to him twice, but as yet have no reply, and, thinking it advisable to collect the amount if possible, I obtained his commercial rating, which in part is: "He is running a small newspaper called the Successful Farmer. Is of small financial means, and not known to have anything in excess of exemptions...and can not be reached in any way." I informed Mr. Robie of the objects of our Association, and told him that unless settlement was made beekeepers would be informed as to his method of doing business, and cautioned regarding their dealings with him.

This is the only one in which during the past five years, I have failed to make a settlement in the name of the Association. A. B. MASON, Sec.

Pres. Root—Are there any other matters to come up before we adjourn? Mr. Abbott—The Legislative Committee.

Pres. Root—I will name on that committee Messrs. R. L. Taylor, O. L. Hershimer and Herman F. Moore.

Mr. Abbott—Let me say briefly that the purpose of that committee is to look up the laws in the various States relating to bee-keeping, and to draft such laws as are thought proper in the interests of beekeepers. Those laws will then be submitted to the General Manager, and when you want a law past in your legislature you send to the General Manager to get a copy of that law, then each State will have a number of them, and as laws are passed on, drafted ready to go through.

I have a man now in Missouri who says he will put one thru our legislature this winter.

Pres. Root—Is there anything further that should come before this convention before we finally adjourn? Dr. Mason—Nothing is yet known as to the time or place of our next meeting; we have been following the Grand Army Encampment; they have not decided where they will meet; as soon as we have decided you will learn of it in the bee-papers.

Mr. Root—If there is nothing more, I think we may consider ourselves adjourned. sine die.

Owing to some misunderstanding no report has been sent to me of the Wednesday evening session by the stenographer, and altho I have twice written about it, and it was promised, it has not been received, and as Mr. J. M. Rankin's paper on "Breeding for Longer-Tongued Bees" was read at that session, I have been waiting the arrival of the stenographer's report before inserting his paper in the report, but as it seems probable no report will be made, Mr. Rankin's paper will be inserted here.

Breeding for longer-tongued bees.

The subject which was assigned to me to discuss is one which has but recently been considered by the public as an important one. There are a few men who have been working along this line themselves, but for some reason or other they have neglected to inform the public as to their results. It may be that they were afraid of being laughed at for working on such a crazy hobby, or it may be any one of a dozen other reasons; but the facts of the case are, that no attention has been given it by the bee-keepers until the last three months.

The beginning work of this kind it is always well to stop and consider the probable advantages that would be gained if we were successful in accomplishing it. And also count the cost of bringing about the desired change. Then, by a mathematical calculation, as it were, we can determine whether or not it is worth our while for our Associations to make use of the great advantage in having bees with a tongue 8 or 9 mm. long, would be that they would be able to gather nectar from the flowers whose corolla-tubes are now too deep for them to work on. There would be myriads of gold of honey deposits would be of easy access to our bees, which at present are entirely useless except to the bumble-bee. The principal one of these would be red clover. It is a known fact that as the flowers open it becomes more and more desirable for the wild vegetation with the forests give way to the farmer's corn, potatoes, and hay, that the bee-keeper realizes that it is time to move to better pastures. His crop has become too uncertain because of the bee.

If the honey-bee could reach the nectar in the clover-heads, the bee-keeper would not find it necessary to move. When there is only one ordinary amount of honey in the corolla-tubes, it is of no value to the honey-bee, because it is out of her reach. She is compelled to wait until a moist or a very little while has passed, before she can pierce the 8 mm. of the top of the tubes. What a difference it would make in the honey-crop, in these old sections of the country, where clover comprises half of the hay crop, if a bee could work on it on it.

When beginning this work I sought the advice of several scientific men. I received no help, and no encouragement. One of the most prominent entomologists in the country said that it hardly seemed possible, for the next hundred years, it would be a pleasant way to spend any time in trying to accomplish something which was an impossibility. Had I been wise I should probably have taken his advice, but I did not. I went to work to contrive some way of measuring the tongues of the bees. After much experimenting I settled on a compound microscope with an m. c. scale, and a camera lucida attachment. The bee was killed by chloroform, the tongue removed, placed on a slide, and its position by the compound microscope, and the m. c. scale, as well as that of the tongue, was then thrown on the desk beside the instrument. This, however, proved to be a very unsatisfactory method, as it is a difficult matter, and requires the best of the day to make the adjustments of the microscope.

The method finally adopted was to place the tongue on a slide which contained the m. c. scale, then to hold the tongue in place by a cover-glass, and place the whole on the stage of a simple microscope. By this method it is impossible to get the measurements down finer than .1 mm.; but this is close enough for all practical purposes. Many devices have been made to measure the tongue, while the bee is living, but all these have failed, none of these have been practical. The only fact that is of value that I have obtained from them is that during life the tongue can be stretched to a certain extent, at the pleasure of the bee. Just how much it can be stretched I am not now prepared to say. When I had found a way of measuring I was glad to know that the tongues of a certain colony were comparatively uniform, that is, that each strain had a particular length of its own.

After securing the first stock it was possible to find, queens were procured from this stock, and the selections began. The idea that presented itself to me was to cross and recess two good strains, thinking that we would in time produce something superior to the original strain. It is by this method that all the improvements have been made in live stock.

It was right here that the difficulty presented itself, namely: How should I control the mating of the queens? Every method I tried was tried, with little success. I have clipped the tips of the queen's wings, with the intention of impairing their flight; have taken off all the way from a hair-breadth to half the wing, but out of 15 queens thus treated only one was mated.

I then tried the plan of cellaring the nucleus containing the virgin queen, and also a full colony of bees containing drones. Then I releast them towards evening, after the drones had gone to the yard. The results were little better than those of the first method.

The only plan which has given me satisfaction is to keep a colony with drones queenless until toward the close of the season, and after the other drones in the yard are killed off. The virgin queens would generally be success-
fully mated. This plan, however, prevents more than one cross taking place. It has been proven that inibeing used by live stock, where breeding from nature toward a certain type, that the selections must be from both the male and the female, and of the two the male is the more important. It is necessary, therefore, to control both sides if we wish to develop a longer tongue, because it is not a natural tendency.

After three years of failure and success from these and other methods, from stock which measured 5, 8, and 6 mm., I have made two direct crosses, and the result is stock which measured 6.4 mm.

There is as yet a question as to what will be the outcome of this idea. The problem which confronts us at present is to determine how far the result is the general tendency in this, as we may experience the difficulty of having our stock suffer from in-and-in breeding, but this can doubtless be overcome.

To Sum One will take the contract of mating the queens as I want them mated, I would agree to develop the strain of bees with a tongue as long as desirable.

There are three methods, it seems to me, of accomplishing the desired results. One would be to sow a large barren tract on some island in the sea with our June clover. The corolla-tubes of this would be short because the soil would be too poor to grow the clover thrifty. An apiary located in this clover would reap a fine harvest from it because of its corolla. Then we would gradually lengthen the corolla-tubes by adding fertilizers to the soil, and in a few hundred years we would have bees that would successfully obtain a harvest from June clover. We all know that it is the tendency of animal life to adapt itself to its surroundings. So the bees would gradually stretch their tongues to reach the nectar in the clover. This method can hardly be considered practical.

The next best thing will be to increase the length of the tongue by direct crossing. This method will at the best require many years of careful work. Why not add to this another method which will work in with this one perfectly, namely, to breed a race of clover with a shorter corolla-tube? Plants are more variable than animals, and therefore more easily changed from their original type.

There are examples of this all around us. From a small yellow variety of corn, with an ear less than 6 inches long, and a stalk not 3 feet high, we have the large varieties of Dent, which stand 10 feet, or even more, in height, and two or three ears. Cabbage and lettuce have been selected with a view to the value of their leaves. Phlox drummondi has within the last 50 years been changed from a small pinkish flower to the beautiful double white flower of the present time. All these have been selected with a view to a certain type. Closers have been develop with a view to a forage crop, and nowhere is there any record of work being done on the flowers themselves — one of our best authorities on botany, and especially grasses — said while talking with me on this subject: “A field of clover represents as many and as varied types of the same species as would a field of corn planted from a mixture of all clover varieties.”

I see that, then, that there is a chance to do some good work on the clover. There would be little danger of its going back to its original type, for only the short corolla-tubes would be fertilized by the honey-bees, and the first crop of this clover would yield the seed.

Let me impress upon you that in all probability there are few present here tonight who will live to see bees work from June clover. Do not misunderstand me: I honestly believe that it is possible to breed a strain of honey-bees with tongues long enough to work clear to the bottom of a June clover-blossom, but the process will be a slow one, and probably not practical for the ordinary bee-keeper to undertake. What I do think will be practical, and should be done by every bee-keeper, is to keep the longest-tongued stock that it is possible for him to find.

I dare say that next season there will be cataloged by the prominent supply-dealers a piece of clover stock of various scales, tense, and a half-dozen cover-glass throns in. They will offer the whole outfit for about $2.00, and every up-to-date bee-keeper will know the length of the tongues of the queens of the strain of bees in his yard, and will rear his queens accordingly.

I think that in the past the ordinary bee-keeper has been too likely to rear his queens “just as it happened,” or possibly with paid special attention to the three or five yellow bands. This is all wrong. When selecting a work-horse do not pick out a sharp-back, slat-sided horse just because he works willingly. We find a square-built, blocky

horse that has the ability as well as the willingness to work. Why not apply the same horse-sense when selecting our breeding stock in the apiary?

If this method of selection is followed for a few years there will be no more short-tongued bees in your apiary. Then, too, you will not see one colony working on some vile weed, and storing strong, black honey while the colony beside it is storing beautiful white honey from second-crop clover, or from some other plant with a deep corolla.

J. M. RANKIN.

REPORT OF THE COMMITTEE ON A MODEL SCORE-CARD.

The committee appointed at the National convention in Chicago, to draft a model score-card to be used in judging bees, honey, etc., at fairs, was appointed so late in the meeting that they could not get time to decide on various points, and after much corresponding they have decided to offer the enclosed score-card—not as a perfect score-card, but as a help, and with the hope that it may be tried in various parts of the United States, and then be so modified by another committee at the next meeting as to fill all demands:

In several places in this report Mr. and Mrs. R. C. Aikin's little daughter has been credited with having entertained the convention with songs and music on the piano, but Mr. Aikin writes me that Mr. and Mrs. Acklin's little daughter has been doing the same with a very much larger apparatus in order to make such a mistake when two such bright and winsome Misses of so nearly the same age were constant attendants on our sessions.

**Contributed Articles.**

**No. 5. Extracted Honey Production.**

**Machinery Needed—Freeing of Impurities—Why Some is More Watery Than Other.**

**BY R. C. AIKIN.**

I have added to the extractor there are knives, knife-pan, and all-stove to heat same, capping box or can, strainer, and one or more tanks. The larger the tank the less trouble and the better the honey. Some use a tank of about a barrel capacity, a real barrel sometimes serving the purpose; such will do for an extremely high flow and a high temperature. I will not specify a definite size of tank, but rather tell you what you ought to do, and then you can judge for yourself of the size best suited to your needs.

It is rarely that any foreign substances get in the honey but bits of wax and propolis. Wax weighs, I think, about 7 pounds to the gallon, being lighter than water, which is in round numbers 8, honey about 12, and propolis between water and honey. I will say, parenthetically, that if you are melting wax that has propolis in it, be careful not to let it get too hot, for the propolis settles to the bottom of the boiler and will burn there and stick fast to the boiler-bottom. I have just been melting a lot of top-bar shavings composed of propolis and burr-combs, and altho I thought I was not letting it get too hot, yet it burned on the boiler-bottom.

Suppose you wish to extract one or two thousand pounds in a day, and have but a 500-pound capacity settling-tank to receive it—you can neither strain nor settle it properly in that time unless heated to considerably over 100 degrees—I should say not less than 125. The most practical way is a tank of a capacity to hold the honey so you can let it settle for at least a week, and even then it ought to be in a quite warm place. If you want to do good work, and put out a well-rinnen and a clean and nice liquid, use both time and heat liberally.

For several years I used a tank of 1100 pounds capacity, but when extracting 1,000 or 2,000 a day—even 600 or 800 a day—several days in succession. I found my tank altogether too small. A 12 feet across and 4 feet high will hold about 1,000 pounds. I now have one 5 feet across and 6 feet high, which holds 5 tons, is made of galvanized steel, and never overflows with a day's extracting. The outlet is in the bottom; the pipe is elbowed out beyond the tank, and also on the stone foundation built from the cellar floor to about two feet above the ground floor. A brick casing is built around the tank to two or three inches space between tank and brick, until the top is reached, when the brick is drawn in against the tank and mortared airtight to retain the heat.

In the circular chamber beneath the tank is a range stove, and on this is where I melt honey, wax, and such work, and little fire there helps to keep the tank warm. The chamber being of stone, and nearly the whole structure of stone, brick or metal, I can leave a roaring fire and no fear of a burn-out.

Speaking of heating honey, it does not absorb heat as freely as water. Set a chamber or hive of combs of honey in a warm room, and it will be many hours in getting warmed thru, at as high a temperature surrounding as 100 degrees. Look in the list of extracting chambers and store them, and before extracting I keep the room at well nigh 100 degrees for about two days, then extract. I have so treated several tons, warming for extracting after the honey season was over—as late as November and December.

The consistency of honey varies quite materially, much depending on conditions while being gathered. If the flow be very slow, it is extremely delayed and the cells remain open, and the honey is exposed to the evaporating process for such long that it becomes very thick; but with a rapid flow the cells fill rapidly, and the free honey and constantly full honey is evaporated, sometimes even before the honey is sufficiently ripened. When honey comes freely it is dropped into any available open cell, among the brood, near the entrance, in fact anywhere where there is found an open cell, big or little. When the flow lets up, or stops, then this scattered honey is gathered from here and there and stored regularly.

Even a rainy day serves as a chance to put things to rights in a much disordered house caused by the previous rush to get all that was to be had while it was available. This unevenness will be observed at times by thick and thin streaks in the same combs, and some parts of a comb will extract much more freely than another.

All honey intended for table use should be put thru a settling-tank, and some were feasible to get the honey heated to about 130 or 140 degrees before straining, then it would be possible with large but fine and close strainers to properly strain out the impurities; but the easiest way is large settling-tanks. The large tank, as I have said, is a much more effective way of removing what can otherwise be obtained except by freely using heat. I am an advocate of applying some heat to the honey, but too much would be worse than none at all. The best thing in an honey house is an available, well-equipped honey-room, which is handy water and washing arrangements. Where it is possible there ought to be water on tap as in waterworks and towns. The water may be kept in a tank so that it can be drawn at will. A washtub full of water allows for dirty water, and a barrel with a cloth over it for all honey-washings, such as of cans that have had honey in them, honey-strainers, etc. This sweetened water can be poured into the barrel thru the cloth tied over the top, thus straining it as it goes into the barrel. Such savings will make first-class vinegar, and help out in the revenues.

Larimer Co., Colo.

**Do Bees Injure Fruit by Taking the Nectar from the Flowers?**

**BY G. M. DOOLITTLE.**

A Correspondent writes that a neighbor of his thinks he ought to give him several pounds of honey for the injury which was done his fruit from bees taking the sweet out of the fruit-blossoms, this hindering the fruit from perfecting as fully as it would have done, had the bees not taken the sweet, ending his letter in this way, "Will you please tell us in the American Bee Journal whether there is anything in this claim? I do not wish to give out any honey as pay for damages, as it would be establishing a bad precedent, altho I generally give honey to several pounds of honey to my bees, for I like to see them enjoy it; and it also helps to smooth over any rough feelings which the bees may cause in any way."

I like the spirit of the last words from our correspondent very much, and know from experience that the giving of a few pounds of honey to all the bees will smooth over all bee-spots on drying clothes, an occasional sting gotten by a bare-footed child stepping on any bruised or partly decayed fruit which may happen to have a bee in or on it, etc., and we feel that it is much more valuable than the giving of some of the "first fruits" of my honey to those who may have a chance at some time or other to be annoyed by my bees. But while I so believe, I would never give out a pound of honey as pay for damages, nor should I give any, no matter how much working on them, for no damage is ever done. In fact, it is always the other way. The bees always help in perfecting any fruit which is visited by them while the fruit is in the blossom or flower.
form. It is only from jealousy, coming from that innate weakness common to all, causing a restlessness to come over others by seeing the bee-keeper prosperous, that such discontent and such ungovernable jealousy and to show any con-
cession on our part at this point would be to "let down the bars" for a still greater call upon us.

No sooner did it go out by a gossip of our neighborhood, that the Stolly was putting money out of his bees, than a few about me began looking for their nuts and showed no signs of wanting to give over their hard work. The bee-keepers who saw the bees at work on the bloom in their orchards, meadows and buckwheat fields, they began to reason that Doolittle was getting rich from that which belonged to them, and from that day till next fall that the honey stored in the flowers was placed there for the development of the fruit; and as the bees took away this sweet as fast as it was secreted by the flowers, an injury must result to the product coming from these flowers and the fields, which injury did much to enhance Doolittle's gains.

Since being in the queen-business more largely than in the honey-business, I have heard less of this than formerly; but from my own experience I doubt not that every pros-
perous bee-keeper has either heard something to this, or, if he has not heard it, his neighbors have talked it when not heard by him. I have even been asked for ten pounds of nice basswood comb honey as pay for what honey the bees gathered from a particular field of Canada buckwheat, which the owner of the land had allowed to grow up thru his shiftlessness, he arguing that a pound of honey from an acre was a very light toll, indeed. When thus approach, I have always given my fair share. Even of the one I was grieved one, and demanded a cash return for the service render-
dered the crop by the bees causing greater frugal use than the properly pollinating the flowers work upon, and have always been satisfied with the results. Every party so approaching me has gone away convinced that I was in the right in claiming that better results always attended any crop which was visited by the bees in the blossom form.

A little different view of these matters than do most other people going back to the creation of all things and telling how all fruit or grain of any kind was an entire failure till insects were created to visit the flowers which secreted nectar, while those that did not secrete nectar were always plentiful and fruitful. Bees, then, like the birds far, all is a matter of conjecture, but it serves the purpose of getting the thoughts of the one talk with from what he considers a grievance, over to a line of thinking where he is at least a little pliable toward the bee's side of the matter. From this I go on to explain how that the first object of nectar in the flowers was not for the perfecting of fruit, or to be used as a food or luxury for man, nor even to sustain the life of the bees, but as a means to an end, and that this end was that the flowers bring the bees forth for the purpose of pollinating the flowers so secretting, that the fruit, or female blossoms of plants which could not possibly be fertilized in any other way, might be fertilized thru the agency of insects which would pollinate them. The bees bring and attractive morsels of sweet they spread out before them as a sumptuous feast, while honey as food for the bee and for the use of man came in as a secondary matter or item.

I then proceed to dwell on insects other than the bee, and show that these out-number the bees by scores, as all close observers well know, showing that to claim damage of any one from these would be something not to be har-
bored for one moment.

Having gotten the thought now fully on my side of the matter, I next proceed to quote from Gregory's treatise on squashes, where he says, "The primary reason why a squash grows, is to protect and afford nutriment to the squash-fruit, and therefor must be supplied with a sufficient body and food; and, thus line of reasoning prove that the primary object of the nectar placed in the blossoms of the squash was to draw insects to the blossoms, as the female blossom is of such shape, and being hid down in the leaves, that pollina-
tion could not be effected in any other way, and thus neither seed, nutriment, nor anything of the kind could be obtained, were it not for the insects which were attracted by the nectar placed in the squash-fruit which was placed in these for the sole and only purpose that the squash might grow.

I then go on to give Gregory's experiments of covering the female blossoms so no insects could visit them, and without a single exception, every such covered squash-blos-
som was unfruitful. I also tell how bees were once banished from the town of Wenham, Mass., and it was found that no
perfect fruit was found in the interior of that township until the bees were requested back again; winding up by asking, "Why, then, is nectar placed in the flowers?" This nearly always brings an answer more or less favorable to the bee, which I make more impressive with, "To attract insects that the blossoms may be properly fertilized, pri-
marily; and, secondly, for food for these insects, which food for insects, in the case of the bee, is utilized by man. Anec-
dotes by this time have swarmed up here, one with a griev-
ance, as he or she thought, is won over to the insect side, if not to the bee side, and I hear no more of paying for dam-
ges done to flowers by the bees.

There remains the line of reasoning, rather than giving any honey or anything else to pay for dam-
ges claimed to be done thru his bees to the flowers in his neighbors' fields or orchards."

What About the Hare?—Will It Become a Pest?

BY FRIEDMANN GREYER.

T
HE reports on the Belgian hare in this and other papers are somewhat conflicting, and people's opinions go widely apart. Mr. Martin says in Gleanings in Bee-
Culture that after an absence of nine months from Los Angeles he finds the hare-business—which had been in a flourishing condition before he left—dead and gone; and,

further, that the hare-meat can not compete with other meats.

Mr. Morrison in the same number of Gleanings says the hare firm in Melbourne sent 5,000 cans of fresh rabbits to England; further, that he can buy in Bermuda a whole imported canned rabbit for 24 cents.

Mr. Martin's and Mr. Morrison's statements do not exactly harmonize, and yet are not so very far apart. Mr. Martin does not say the hare is not the hare-grower's stand-
cier's standpoint. Mr. Martin evidently does. The conser-
ervative observer has been quite sure from the very beginning that the life of a $50 hare-boost would be short. There may be few, but in the future will be willing to pay $5.00 or $10 for a pedigree hare, but the majority of hare-grow-
ers must grow the animal for meat-stock and so can not afford to pay exorbitant prices for breeding-stoc-

k, particularly as the difference between the 50-cent hare and the $5.00 or $10 hare is not there at all, but merely in the slight difference of his color, which disappears when the pelt is pulled off. The 50-cent hare has more white hairs on the legs and undersides than the other, but is just as good for the table. That is what we raise the hare for, and therefore can not see good business sense in it, to pay these fabulous prices.

Why the meat of this hare could not be made to com-
mensurate with other meats is easy to see, it certainly does in our own home, and others that I know of. We like variety. A few years ago we got tired even of capon meat. My bet-
ter half said she did not like those great 10-pound car-
casses, they lasted too long. A hare is a smaller animal and attractive morsels of sweet they spread out before them as a sumptuous feast, while honey as food for the bee and for the use of man came in as a secondary matter or item.
would probably be better if the society would petition the legislature to enact a law to prohibit the growing of the hares within the State. A comparison was even drawn between the hare and the English sparrow.

These good people are unduly scared. I will admit it might be unwise to turn a large lot of hares loose into a young orchard in the winter-time. I very frequently turn off 12 of the animals at any time with 600 young fruit-trees growing near by, which I would not have injured for all my hares. Yet I have not the slightest fear that any of the trees will be damaged. The fact is, I have never had a tree killed or blighted by the wild rabbit, which I had taken the first three years was very plentiful here, nor by my hares, except when the fruit-trees had been planted in the hare enclosure. The woodchuck is the destroying foe among our fruit-trees—not the hare; and the States could well afford a bounty for every specimen killed; the hunters would take care of the hares. In some localities nurserymen sustain heavy losses by the work of wild rabbits, it is true; but a few hunters with dogs and ferrets will—just glad to do it, an infected district in a short time. I do wish we had more wild rabbits.

The hare—because less cunning—could be subdued and cleaned out much more easily and quickly than the wild rabbit. However, nobody need be afraid that any hare-grower would be afraid of the hare, and give up his occupation, as I believe California has a law against liberating hares.

Sometimes when I wish to dispose of surplus stock, to make room, I kill a number of them at a time, stove out the meat and can it in our regular one or two quart glass-cans. Thus prepared it is ready any time for lunches or other culinary uses.

I am not sure that the hare industry is the coming industry, as Mr. E. T. Abbott puts it, or that it ever will assume gigantic proportions as to become a leading industry, but I am sure that it will always be and remain a pleasant auxiliary for the production of choice meat, for one can put at least, and at a very low figure. In my individual case, if I had several hundred grown animals now on hand I could very easily dispose of them at 15 cents per pound.

**A Brother's Testimony.**

I will add that my brother Friedemann, is hardly enthusiastic enough about the value of the Belgian for meat stock. In quality, the meat is unsurpassed—I believe even unequalled—by the meat of any other domestic animal, the capon excepted. A well-roasted young Belgian hare is a treat, indeed.

In a general way, Friedemann has given the facts in the case.

T. GREINER.

**Questions and Answers.**

**Conducted by Dr. C. C. Miller.**

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail—Editor.]

**Death-Rate of Bees in Cellar-Wintering—a Foul-Brood Deal.**

1. I put 72 colonies of bees into the cellar Nov. 22d to the 20th, just after a good flight, but found many dead bees on the bottom-boards, which were all cleaned out. About one-third of the colonies were wintered in the snow, and nearly all of the latter were raised ½ inch blocks put under the front end. As there seemed to be more dead bees than usual on the cellar floor, I made a note of all, swept up since Jan. 16th, which was as follows: Very early twenty quarts spotted; Jan. 24th, nearly two quarts, and four hives spotted; Feb. 1st, § quarts, and eight hives spotted; Feb. 7th, § quarts, and 12 hives spotted; Feb. 14th, two full quarts, and 15 hives spotted.

Is the above an average death-rate, or is it above the average? Would it be best to put the bees out for a flight on a good day, and then return them to the cellar? The cellars are rather damp; it was tiled Nov. 1st. The temperature has been from 40 to 48 degrees.

2. I bought bees of B—7 colonies at $3.00 each, in April, to be used for honey produced by the bees, (but not to be confined entirely to 7 colonies). Six of the seven were affected with foul brood. One colony the buyer (and supposedly unknown to the seller). The bees being black, part of them were used for rearing queens to requeen the rest, and divided into nuclei. (Don't say A was foolish—he did not know B was any foul brood in Iowa.) Result: 11 colonies have been treated for foul brood, 2 of them absconded, one full colony and one 3-frame nucleus were sulphured, and three of the treated ones died during winter, probably of foul brood, and 2 are kept in low, without any thought of the legal points in the case, what would be right and just to both parties? Ought A to pay the full amount to B, or has he paid enough? Only one of the seven colonies stored any surplus honey.

**Iowa.**

Answers.—1. There is nothing very unusual about the mortality, but so many hives being spotted so early in the winter gives occasion for some uneasiness. When a cell or damp it needs a higher temperature than when dry, and it is possible that a higher temperature would have prevented all spotting of the hives. The temperature was rather low in any case if it ranged evenly from 40 to 48 degrees, for that would be an average of 44; and if most of the time it kept below the lower limit the case was still worse. Unless they are very bad, it is hardly advisable to put them out of the cellar until they can stay out. Experience has shown that when put out and returned to the cellar they are not likely to do very well. But it is advisable to put them out earlier than you would do if they were perfectly healthy.

2. The probability is that the moral and the legal view of the case would closely coincide. If a merchant were to pay for foul brood, it might make the price of sand instead of sugar, he ought not to be paid more than the value of the sand, and the fact that he was ignorant of the character of the material sold would not in the least degree enhance the value of the sand. The cases are not exactly parallel, for while one might be tempted to accept sand at a price sufficiently low, he would hardly want to accept foul brood without being paid for taking it.

---

**A Beginner's Questions.**

1. I had one colony of bees last spring, and they worked well at first, but after the first swarm they stopt work. What made them do that?

2. Four years ago I had a colony that swarmed three times. They work all the time till all the brood is out of the cell, and then all the bees leave the cell and in the spring they all died. Do you think the cell was too damp for them?

3. How long does a worker-bee live—40 or 60 days?

4. How many days does the queen have with her during the working season?

**New York.**

Answers.—1. The probability is that there was no work to be done, that is, no honey in the flowers. Sometimes the flow ceases when there is no apparent reason for it. Then it may start again without any difference that may be. It may be, however, that you mean that this one colony stopt work while others continued to work. The fact that it swarmed was enough to account for at least a very great decrease in the amount of work, and it may only be done where there are workers, and when that colony swarmed most of its workers went with the swarm. You will find it invariably the case that when a colony swarms there is a great falling off in the work of the mother colony.

2. It is impossible to say without knowing more about the case. If the cell was very damp, that would of course be something against their chance of wintering well. But no man there is known to winter well when a colony swarms three times. Under ordinary circumstances two or three of the colonies would be weak for good wintering. The mother colony would be greatly weakened by so much swarming, and it would hardy be strong. But that does not account for the death of the first swarm, and one can only guess that a cell or too damp or too cold, or too little ventilation of hive or cell or both, or some other thing was the cause of the loss.

3. The life of a worker-bee depends upon the amount of work done, and so to a great extent on the time of year.
A worker that enters its career just after half of the work in the field is over has little chance to wear itself out with work, so it lives to be six months or longer. If it starts in time there is work for all hands, say the last of May, it will live about six weeks.

4. There is no rule as to the number of drones to be found in a colony during the working season. Other things being equal, the number of drones will be older than with a young queen. The harvest has something to do with it. If the harvest is fitful or poor, the chances are not so good for a lot of drones to be allowed in the hive. The combined bees will be less difficult and drones will be found in a hive with little or no drone-comb.

Building Up Weak Colonies—Stimulating Brood-Rearing by Feeding.

1. I read that sometimes even very weak colonies—say covering only one comb—build up in very good seasons so fast that they make not only strong colonies, but even store some surplus honey. Now, do you think it would be advisable to-day to divide a colony covering eight frames into eight nuclei, giving each a young and fertilized Italian queen? As we expect a very good season, if the strong colony could get two or three times as much extra honey, would not the eight colonies (or nuclei) build up so well that I could get from 60 to 80 pounds from each?

2. Is it of any use to feed for stimulating brood-rearing in the spring? We have plenty of hives. What can I do to stimulate them?

CALIFORNIA.

ANSWERS—California.

I. It is true that a nucleus with bees enough to cover only one comb may build up into a strong colony and give surplus. It is also true that a strong colony may go thru a good season and yield no surplus with anything left in the foundation, but do better in the fall than in the spring. Both are exceptional cases, and it will not do for a beginner, nor indeed for any one to take either extreme as a basis. There is of course a possibility that an experienced bee-keeper might divide a colony covering eight frames into eight nuclei and obtain from each a surplus of 60 to 80 pounds in your wonderful California. The probability is that he would obtain no surplus whatever, if indeed no feeding was necessary. It is hardly advisable to start a nucleus with bees covering only one frame with adhering bees, and even then you should not expect wonders.

II. It is a little hard to say. If there is an abundance of stores in the hive, stimulative feeding may do little or no good, and if unwisely administered it may do harm by starting the bees flying when they have no work to do and when there is plenty of honey in the hive. A beginner may do as well to see that a colony has abundance of stores, and then let it alone.

Mice Trying to Reach the Bees.

My bees have had no flights for over a month. I find that mice have tunneled thru the snow to get at the dead bees as they fall at the entrance. They have gnawed some trying to get inside. Do they do any harm? If so, how can I avoid it?

PENN.

ANSWER—Of course the mice do no harm by eating the dead bees thrown out at the entrance; but they may do harm, and a whole lot of it, if they make their way into the hive. Mice in a hive will eat the honey and the bees, and they will destroy the combs. If they did neither of these things they should still be outlawed because of the harm they do by making holes in the foundation. Little gnawing is desirable. Of course the entrance should be large enough so that a very little gnawing would be necessary for a mouse to gain admittance. But there is no need to admit the mice were the entrance ten times as large. Close the hive with wire-cloth having about three meshes to the inch. That will allow free passage for the bees but exclude the mice. If not convenient to get such wirecloth, you may make a fence of wire-nails at the entrance, setting the nails about a quarter of an inch apart.
Mr. E. J. Baxter and his Home Apiary, of Hancock Co., III.—See page 163.

Journal. It will be my earnest hope and determined effort to bring into it something each week that may happily quicken joy and lessen grief. May I not hope to have the aid of all our readers in making this department something that will be looked forward to, week by week, as precious to those who even may not longer have interest in the apiary? A. J. Cook.

MAXIMS FOR THE HOME CIRCLE.

I copy the following from the “Intelligencer.” I know nothing of this paper, its editor, or whereabouts, but I do know that if it has much like the following it is certainly rightly named. As I read over the following, “How to Make Happy Homes,” the methodist in me (and I claim to have not a little) gave forth a most hearty “Amen.” As I read it later about the “home circle,” I found the “Amen’s” came twice-repeated.

1st. — “Learn to govern yourselves and to be gentle and patient.”

What could we covet more wisely for our children than that they follow this maxim? The best way to secure this is to follow it ourselves. A man who kicks or strikes his cow is bequeathing to his children a very questionable heritage. I know a man who once moved, I think, as many as twenty times during a milking, and every time with a gentle “So, boss,” and a more gentle press of the teat. The poor cow had a deep sore in the nipple. To have whipt and scolded would have been rank cruelty. Such an exhibition before a child would have been a grievous blunder. I know of a father who lived to be 83 years old. He was a fine example of physical energy and had an impetuous spirit, and yet tho I knew him very intimately, I never heard him utter a word that favored in the least harshness to the dear, loving companion who was indeed a true helpmeet. I know a boy, tho hardly now a boy, for he is on the 30th side of the 20’s, who tho he has the same spirit and temperament of the man just mentioned, yet I never knew him to lose his temper or show impatience. His parents told him as soon as he could understand that it was mainly to govern one’s self. They acted their teachings as far as possible. Need I say that the result has made glad hearts?

2d. — “Guard your tempers, especially in seasons of ill health, irritation, and trouble, and soften them by prayer and a sense of your own shortcomings and errors. Remember that valuable as is the gift of speech, silence is often more valuable.”

That is good advice. A home where such counsel prevails is a glad presence in any neighborhood. Who of us has not regretted with anguish of heart the angry word, or the irritated demeanor? How gladsome in the home is the temper that is ever controlled. How fortunate the one who canightly hold of silence when to speak is to wound. Even the bees resent the nervous, irritating mein.

3d. — “Do not expect too much from others, but remember that all have an evil nature whose development we must expect, and that we should forbear and forgive, as we often desire forbearance and forgiveness ourselves.” I will only add to this Christ’s incomparable words — “Father, forgive them for they know not what they do.”

4th.— “Never retract a sharp or angry word. It is the second word that makes the quarrels.” This is hardly more than the 1st and 2d. Government of self and temper controlled, will always stay the angry word. The quarrel is never manly, and we do well to remember that it always takes two to make one.

5th. — “Beware of the first disagreement.”

What better advice than this could be given the twain who are just forming the home circle?

6th.— “Learn to speak in a gentle tone of voice.” We can hardly understand how much seeming trifles like the voice-tone have to do with character. The description of Cordelia in Lear — “Her voice was gentle, soft, and low — an excellent thing in woman,” is suggestive. A low tone, even in times of excitement, will generally effect more than bluster. Nervous and excitable children, especially, should be urged to gentle speech for it will surely bear fruit in character.

7th.— “Learn to say kind and pleasant things whenever opportunity offers.” In other words, “Blessed are the peacemakers, for they shall be called the children of God.”

8th. — Stedy the character of each and sympathize with all in their troubles, however small. We may couple with this, “Inasmuch as ye have done it to one of the least of these, ye have done it unto me.”

9th. — “Do not neglect little things if they can affect the comfort of others in the smallest degree.”

Who has not seen homes that were constantly all awig with little, thoughtful acts?

10th. — “Avoid moods and pets and fits of sulkiness.” If anything would convert us to the theory of the brute ancestry of man, it would be to see him in the sulks.

11th. — “Learn to deny yourself and prefer others.”

This was the very essence of Christ’s whole life and teachings.

12th. — “Beware of meddlers and tale-bearers.”

I would add, Let us be very careful that we do not join their gruesome company.

13th. — “Never conceive a bad motive if a good one is conceivable.”

Could we do otherwise if we obey the Golden Rule?

14th. — “Be gentle and firm with children.”

I will add that if anything will keep a child in the right way it is that sacred thing—the mother-love. God pity the child who is bereft of it.

15th. — “Do not allow your children to be away from home at night without knowing where they are.”

Is it not wise, also, to be with them ourselves? Their fullest confidence will prevent much mischief.

16th. — “Do not allow the children to go where they please on Sunday.”

I know from a blessed experience that a home that is made to hold the children on Sunday will ever have their reverent gratitude. The home circle ought to keep the children at home, and on Sunday.

17th. — “Don’t furnish them with much spending money.”

I have known many college boys ruined by a plentith of greenbacks. I have known many to be made magnificent men by the stringency of hard fortune. To the man who hands out money in fullest measure to his son, I would simply say, “Don’t.”

HELPFUL SUGGESTIONS REQUESTED.

I shall welcome hints for the home, recipes for table articles, and any other helpful suggestions.
**Prospects Bright—Losses by Fire**

The prospects for our bee-keepers appear to be much brighter than they were last season. We have had a pleasant winter so far—not very warm and not very cold, and reports are that as a rule when we went into winter quarters in fairly good condition they seem to be doing very well. The snowfall is heavy, and it is but natural for the hives to be gathering in a panic, ande the snow storms; this will assure a bountiful supply of irrigation water. The chances for a druth in the remainder of the season are growing beautifully less each day.

I read the notice of your loss by fire with mingled regret. Some of our best hives have been badly scorched, so that they know how to sympathize with you.

On May 1, 1866, I was awakened by a roar of fire, and got out just in time to see 50 colonies burned up in less than half that number of minutes. The fire was in a two-story lumber barn belonging to a neighbor.

I live on a lot 530 rods, with a street in front, and four close neighbors, and only five blocks from the business center of the city. Yet after 17 years I have never had a complaint, and judging from the thickness of our line of our bee-keepers, would indicate a difference in management. I have kept from 10 to 50 colonies each year.

**Salt Lake Co., Utah, Feb. 20.**

Jesse M. Donaldson,

**Prospects Good for Southern Indiana.**

The thermometer has been at 10 degrees above zero for the past three days, after three weeks of mild spring weather, which started heavy brood-rearing in all colonies having plenty of stores. This will cause great losses to southern Indiana bee-keepers. The winter so far has been so soft that hives have consumed nearly all of their stores.

There has been very little snow to protect the clovers, and sweet clover honey can stand the most exposure. I am experimenting with a large number of honey-producing plants. In the river bottoms I had an acre of sunflowers, and have a lot of seed from which I intend the bees work on them continually last season.

J. C. Wallenmeyer,
Vanderburgh Co., Ind., Feb. 22.

**Rendering Wax from Old Combs.**

In rendering wax out of old combs I use the following method:

Take the ball off of a 2-gallon tin pail with florining sides, nail a stick about three feet long to the pail, so that it will project upward, then with a hammer and a 4-inch spike begin with the bottom of the comb that covers the pail all the way around, and to within 3 inches of the bottom. Fill a big iron kettle about half full of water. Place small third or fourths full (a little better soak them, some, or break or chop them up). Hang the kettle in the yard, and start a good fire under it about sundown, if the bees are flying. After the mixture has boiled a little while take the perforated lid and begin pushing it down into the melted

Maule's (35 new things for 1901) Seed Catalogue

You should, by all means, have this modern catalogue of modern times. It is simple and clear and contains 45 novelties in vegetable, flower, and fruit seeds, flowering plants, ferns, grasses, and fruits. It contains 45 novelties in vegetables and flour seeds never offered before. It is 12-18 large folio, full seven handsome colored plates and hundreds of illustrations. It gives given all up-to-date cultural directions and offers many cash prices. The first edition was 3,000 copies, so when we send it free to all customers, we must ask others to send in for their share, which amount may vary from their first order. You will make a mistake if you do not write to-day for this Novelty Seed book of the year. Address, WM. HENRY MAULE, Philadelphia.

HOME-SEEKERS' EXCURSIONS

On the first and third Tuesdays of each month the Chicago, Milwaukee & St. Paul Railway will sell round-trip excursion tickets from Chicago to Milwaukwe and other points on its line to a great many points in South Dakota, North Dakota, and other Western and Northwestern States at about one fare. Take a trip West and see the wonderful crops and what an amount of good land can be purchased for a little money. Further information as to rates, routes, prices of farm lands, etc., may be obtained by addressing F. A. Miller, General Passenger Agent, Chicago, Ill.
one colony queenless with queenless-celled started. I thought it very doubtful if any queen would become fertilized at that time. (Dec. 17,) as I had only two other colonies at home, and no drones to be found in any of them. (My apiary is 5 miles away), the course of time brood was sealed, but every one aigo, so concluded that the next thing to do was to find a virgin queen, then the progress of Nature might go unhindered. In looking over another colony for eggs I found a frame with a queenless cell nearly ready to be capped, which gave I the queenless colony after removing the drone-layer, and putting all frames containing eggs and brood into another hive. In two days other queenless cells were started, then I put the drone-brood back and let them work out their own family affairs. Twenty-seven days from the time of putting in the frame of eggs given the mice and robbers put them with eggs in two frames, and plenty of drones. I expected to have a case of supersEDURE in the hive of which, I thought the queenless, but yesterday I found plenty of eggs and brood, and concluded that her majesty had a greater reserve of vitality than her subjects gave her credit for.

F.C. Woolls.

Using Chaff Cushions in Summer.
I have practiced leaving the chaff cushions on my hives all summer as well as winter, the last 6 or 7 years. I have tried both ways, and I find I gain at least 30 percent from the chaff-covered hives. I have noticed in very hot weather the bees did not cover that part of the hive which would be nearly empty from 10:30 a.m. to 2:30 p.m., while those protected with chaff cushions never came to that extent, this is why I make them appear as full of bees as they could be.

My wife often says that I do too much experimenting, but I find it brings me the knowledge I am seeking for. There is no branch of beekeeping in which I have not experimented. This is a progressive age, and I feel that we can not do too much to further the work of our ladery.

Poor Report for 1900.
The year 1900 was a poor one for bees in this part of Missouri. We got no honey at all, and I am afraid that two-thirds of the bees will die during this winter.
John N. Michael.

Bees Wintering Poorly.
I fear my bees are wintering badly. The weather has been very cold and rainy for about four weeks. We have had no rain since last November, and but little snow.
Hendy Alley.

Dispersing Robber Bees with Gun-Powder.
I have been a keeper of bees since the early 1860's, and it goes without saying that I have experienced the usual ups and downs common to the craft: also many of the pleasant (I) experiences, as, for instance, a bad case of robbing—in short, I have been "up against it" many times.

During all these years I have read many ways of stopping this trouble, in the current bee-literature of the times, but I have never seen mentioned a plan that I have often used with remarkable success. I learned it years before I kept bees, from my grandfather who often quelled disturbances with old-time and well-tried remedies. His plan was to "blow up" the robber-bees with gunpowder. About a teaspoonful of powder is pushed into the entrance and then "fooled" off. I am quite sure he knew this to fail but once, when I had an extremely bad case that had to be treated 3 times—the
HONEY AND BEESWAX

MARKET QUOTATIONS.

Chicago, March 8.—Fancy white comb sells regularly at Chicago in the neighborhood of 15 cents per pound, and fair white comb is weak at the following range of prices: No. 1, white comb, $1.00 per pound; No. 2, white comb, 80 cents per pound; No. 3, white comb, 65 cents per pound; No. 4, white comb, 50 cents per pound; No. 6, white comb, 25 cents per pound. The season for the sale of honey is strong, and the prices are firm, ranging as high as 80 cents per pound.

KANSAS CITY, Feb. 18.—Fancy white comb, 1.20 per pound; amber, 1.60 per pound; dark, 1.30 per pound. Extracted white comb is weak, and the prices are falling, ranging as low as 75 cents per pound.

CINCINNATI, Feb. 9.—The market for comb honey is becoming very bare, although the prices are holding firm. Fancy white comb is still selling for 1.60 per pound; no demand for darker grades. Extracted is in fair demand; darks for 55 cents; and browns for 40 cents per pound.

BUFFALO, Mar. 7.—Fancy, 1.50c per lb; No. 1, 1.40c per lb; No. 2, 1.10c per lb; No. 3, 1.00c per lb; No. 4, 1.00c per lb. Extracted, 89c per lb. Beeswax, 27c per lb.

New York, Feb. 26.—Honeycomb is being well cleaned up on our market. The demand has lessened quite an extent, on account, we presume, of the high prices which have been ruling. Fancy white still brings 15c in small quantities, 10c in larger quantities, and 7c to 5c per pound in fair-sized lots. Dark and buckwheat, 10c. Extracted rather dull and not much ruling. California white honey, 75c to 60c per pound; dark honey from 60c to 40c per pound; buckwheat, 50c to 35c. Beeswax steady at 2c per lb.

HONEY TARIFF.—We may have a customer with a short supply of white comb honey or beeswax. We are in close touch with all the markets, therefore write us regarding your crop, stating the quantity and the lowest cash price. References—Either Bank here for any business man in this line.

WANTED

A MAN OF PRACTICAL EXPERIENCE and ABILITY to care for 150 to 200 colonies of bees. Address,

S. J. DUNNE,
165 S. Forest Ave., GAIT RIVER FOREST, COOK CO., ILL.

I ARISE

To say to the readers of the Bee Journal that

DOOLITTLE...

has concluded to sell QUEENS in their season during 1901, at the following prices:

<table>
<thead>
<tr>
<th>Quality</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untested Queen</td>
<td>$1.00</td>
</tr>
<tr>
<td>Untested Queens</td>
<td>$2.50</td>
</tr>
<tr>
<td>Tested Queen</td>
<td>$1.25</td>
</tr>
<tr>
<td>Tested Queens</td>
<td>$2.00</td>
</tr>
<tr>
<td>Select Tested Queen</td>
<td>$3.00</td>
</tr>
<tr>
<td>Extra selected breeding,</td>
<td>$1.50</td>
</tr>
<tr>
<td>almost anything</td>
<td>$2.00</td>
</tr>
</tbody>
</table>

Circular free, giving particulars regarding each class of Queens, conditions, etc. Address,

G. M. DOOLITTLE,
11240, Boroine, Grandons Co., N. Y.

Please mention Bee Journal when writing.

24th Year Dadant’s Foundation. 24th Year

We guarantee satisfaction. **

Why does it sell so well? **

What more can anybody do? BEAUTY PURITY, FIRNESS, NO SAGGING, NO LOSS.
PATENT WEED-PROCESS SHEETING.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BEE-KEEPERS’ SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

LANGSTROTH on the HONEY-BEE—Revised

The classic in Bee-Culture—Price, $1.25, by mail.

Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

$200 Red-Clover Queen

Offer No. 35.

On September 1st last we announced that we finally had a red-clover queen fully equal to the one we had years ago. The colony of this queen has given one of the most remarkable showings on red clover of any bees we have ever had. The queen in question is an imported one, and therefore of the genuine pure leather-colored Italian stock. We sent out daughters from her all the season. But we did not discover her value until the clover season, second growth, came on, and then her colony out-distanced all the other 480 that she attracted attention to one.

It must be understood that these queens are not golden yellow, neither are their bees of the five-banded stock. They are simply leather-colored Italians whose mother came direct from Italy.

Since the notice appeared regarding this queen we have hardly been able to supply all of the queens that were wanted from this stock. Many daughters of this queen we sent out before we knew her value, and it now transpires that some of the finest bees in the land are from Queens we sent out early. We are now booking orders for the coming season, and make the following offer, but no queens will be furnished except those that subscribe for gleaning, and only one with each year's subscription. All arraignees must be paid to the end of this year. Gleaning for 1901 and one untested red-clover queen, $2.00; gleaning one year and a tested red-clover queen, $4.00; a select tested red-clover queen and gleaning one year for $6.00. We will begin mailing these Queens in June, 1901. Orders are already entered, and the same will be filled in rotation. Do not neglect to improve this opportunity and get some choice stock, and send your order early so you may get the queen correspondingly early in the season. We are using every precaution to winter this queen safely, but reserve the right in case of loss this winter to substitute from other select tested stock of this strain which we are holding in reserve, or to give the subscriber the benefit of any of our other clubbing offers if desired.

THE A. I. ROOT CO., Medina, Ohio.

GEORGE W. YORK & CO.,
144 & 146 Erie Street, CHICAGO, ILL.

We are headquarters for ROOT’$ BEE-KEEPERS’ SUPPLIES IN CHICAGO.
Send them for their free catalog.
Tent for Controlling the Mating of Queens.
(See page 181.)
—Courtesy Bee Keepers' Review.
Long-Tongued Bees
ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2); or, one Tested Queen free as a premium for sending us FOUR new subscribers (with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Orders for "long-reach" queens will be filled in rotation—"first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash
paid for Beeswax. *** This is a good time
to send in your Bees- wax. We are paying
28 cents a pound—
CASH—for best yel-
low, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly, GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey
ALL IN 60-POUND TIN CANS.

ALFALFA HONEY........
This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and surely everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans, everyone has half of each kind of honey, if you so desire. The cans are box.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address, GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
Large Yields of Honey.—Mr. Frank Benton says: "Mr. Doolittle is mistaken regarding what he says in the last four or five lines over his name, on page 147. Cyprian bees were sent to America in 1860. The yield of 1,000 pounds, in 1881 or 1882, in Texas, was by B. F. Carroll, from Cyprians I sent over."

Honey Prospects in Southern California.—Prof. A. J. Cook, of Los Angeles Co., Calif., writing us March 8th, had this to say regarding the prospects for a honey crop:

"The bee keepers all thru southern California are pleased with the prospects for the coming season. We have had a generous rainfall, and may assuredly expect a bountiful honey crop. The State and three county associations have held meetings within a few days. All are rejoicingly expectant."

Bee-Flue or Propolis in Paint.—Dr. J. M. Ross, of Clearfield Co., Pa., wrote us as follows recently:

Editor York—Enclosed find two samples of painting from bee-flue colored with dry paint—bee-flue dissolved in wood alcohol. I believe it will stand the weather better than oil paints.

This is decided interesting, and perhaps well worth following up. The paint seems to have a fair body, and is with difficulty scraped off the wood. It is possible, and indeed probable, that for some purposes, at least, this paint may be ahead of other paints. If so, there is a possibility of a boom for Tunisian bees. At any rate, if propolis should become a merchantable article, the scraping it off will not be considered the same drudgery that it now is.

Bee-Keeping Within City Limits.—Last week we received the following from Mr. J. C. Wallemeyer, of Vanderburgh Co., Ind.:

Editor American Bee Journal.—A bee-keeper of Evansville—Mr. Bulmer—was fined $5 and costs, March 6th, for violating a city ordinance, which forbids the keeping of bees in the city, or one mile from the city limits. The ordinance went into effect Jan. 1st, and many bee keepers delayed moving their bees until they saw whether the city authorities intended to enforce the ordinance. The passing of the ordinance was a result of Mr. J. J. Cosby’s bees killing his neighbor’s wasps, when taking cleansing flights, and also stinging a horse, altho he made good all the damage done. The above suit was brought about by a relative, who got the worst of a will, and so took advantage of the bee-ordinance to retaliate. More suits to follow.

J. C. WALLEMEYER.

Upon receipt of the above communication we wondered how many bee keepers in and about Evansville are members of the National Bee-Keepers’ Association. If they are not already members they should join at once, before getting into any further trouble.

We would like to suggest that the Board of Directors of the Association look into this matter, and see what they can do to have the city ordinance declared null and void. We see no reason why such should not be done, and done immediately. There is no reason why bees should not be kept within the limits of any city on the globe. Of course, there may be special cases where they might possibly become troublesome, but any reasonable bee-keeper would not continue to keep bees where they were a source of real annoyance to his neighbors.

There are many small apdlaries in quite thickly settled portions of Chicago, and there are also a number of quite large apdlaries further out, but yet within the city limits. So far as we know, they cause no real trouble to any one, while they are a source of considerable revenue and enjoyment to those who own them.

We hope Mr. Wallemeyer will take up this subject with General Manager Secor, with a view to seeing what can be done to put an end to the "more suits to follow."

The "Cotton" Controllable Bee-Hive Fraud.—Mr. C. S. Blake, of Middlesex Co., Mass., has sent us the annual circular for 1911 of "The Controllable Bee-Hive and New System of Bee-Keeping, invented by Mrs. Lizzie E. Cotton, about 1874, now owned by E. C. Cotton." Referring to it, Mr. Blake says:

"It must be all fraud. Would it not be well to expose it in the American Bee Journal? Some 30 years ago a lot of us were bitten by this same Lizzie E. Cotton, now under the name of C. B. Cotton."

Yes, it may be well once more to occupy a little of our space in warning bee-keepers against this old fraud. In 1887, one of our subscribers sent us a similar circular dated 1896. In it we found a testimonial which reads as follows:

Hon. Robert W. Furnas, Governor of Nebraska, says:

Having used the "New System of Bee-Keeping" I found it a success, I recommend it cheerfully to others.

ROBERT W. FURNAS.

Upon receipt of the circular we immediately wrote to the Hon. Mr. Furnas, under date of April 6th, 1897, saying that we had noticed his testimonial in a circular sent out by Cotton, and asked him to let us know the extent of his experience with the Cotton hive and system; also, whether he still recommended it. The following is his reply:

BROOKS, NEBR., April 21, 1897.

GEORGE W. YORK & CO.

Sir,—I have no remembrance of giving the testimonial referred to. Nor do I recall to mind "The New System of Bee-Keeping" named. Very truly,

ROBERT W. FURNAS.

There you have pretty good proof of the fraudulent character of the Cotton outfit, and all bee-keepers will do well to beware of it. With the Cotton circular of 1896 there was offered a full colony of Italian bees in the "Controllable Hive" (6 movable frames), with full set of 50 one-pound boxes with starters of foundation, feeders ready for feeding, and also a book giving full instructions how to manage bees by the wonderful new Cotton system of bee-keeping!—this whole outfit was offered for only $30, $5, & 10, the express office in the State of Maine! In the 1901 circular we find the entire outfit is offered for 80, and 95 boxes instead of 80 are included with each hive. This is getting down more nearly to business in price, but the inducements held out to prospective bee-keepers to invest are somewhat remarkable. For instance, read the following paragraph:

"Two of the largest yields of box-honey I ever obtained, and which I think hard to equal, were as follows, viz.: I selected one of my best swarms in early spring; I fed them and treated them with the object of obtaining the greatest possible yield of box-honey. I arranged to have no increase in number of swarms but to employ all the bees storing honey in boxes. They gave me a little over 800 pounds of nice honey in boxes. Another, a young swarm hived in the Controllable Hive July 1st, yielded in 30 days one hundred and four pounds of nice honey in boxes."

Our Cotton friend also has the following paragraph in his circular, referring to "bee-journals and other publications," which is quite interesting:

Beware of counterfeits.

Please remember, if you want the Controllable Hive with book, giving full instructions for the management of bees, send your order direct to me. Beware of that class who are slanderers and lying against me and the Controllable Hive. They do this thru the bee-journals and other publications that they can control; believe them not. They are
interested in some patent or non-patent or worthless hive or fixtures, and are broiling over with wrath against me, because the Controllable Hive is steadily gaining in the estimation of all honest bee-keepers, and the demand for the thousand patent and non-patent worthless hives is steadily on the decrease. I a word to the wise is sufficient.

We think further comment is hardly necessary, as no reader of any of the present-day bee-papers would be caught by the successor of the fraudulent "Lizzie." It is pretty safe to put it down as a rule that when too much is claimed for a particular hive—especially if the beautiful word "controllable" is emphasized rather strongly—the whole outfit is a pretty good thing to let alone.

The Weekly Budget.

JON. EUGENE SECOR helps to enter the Upper Des Moines Editorial Association, Feb. 15th, of Forest City, Iowa—his home town. From the local newspaper reports they had a jolly time. Mr. Secor gave a reply to a toast, and of course did it in rhyme, something after the Will Carleton style. If it weren't so long we would reprint it, and to make extracts from it would spoil it. Mr. Secor knows how to entertain, and also how to "jollify" himself with his poetical pen.

Mr. D. H. METCALF, of Calhoun Co., Mich., writes us that in his article on page 183 he made us say that the flowers of winter and winter berries are plentiful. This must be the impression which he says that every pound of honey he gets out of a bee-tree costs him $1.00! The fact is, he puts in his leisure time and vacations in hunting bees. He says, however, that we may possibly be correct, after all, as to his hunting bees for a living, as he believes it has prolonged his life, every bee-hunt giving him renewed health and strength.

Anniversaries and Birthdays.—Recently we received the following from a reader who signs himself "Old Fogy."

Mr. Editor:—I've become used to your new-fangled way of spelling, and rather like it, but I don't know about your reform in the meaning of words. Do Rev. A. B. Mettler and you (page 183) mean we shall pay no attention whatever to the dictionary, and just go by your say so? He was born Feb. 1st, 1841, and you say each Feb. 1st since then was an anniversary. The dictionary says such an anniversary is a birth day, and according to what he has had of birthdays, and the first day of next February will also be his birthday whether he is then alive or not. Now, what do you say? Shall we go by the dictionary or the New-York Daily Tribune?—Ohio Flyer.

Seeing this is mostly Mr. Mettler's "funeral" or birthday—we'll let him wiggle out first.

Mr. W. A. PRYAL, of Alameda Co., Calif., wrote us as follows, March 10th:

My Dear Mr. York:—You have no doubt been fully informed about the splendid rain falls we have had in this [central] part of the state. They have been abundant. For about two weeks up to last night, the weather was nice. At the latter time, without any warning to mention, rain set in again and fell copiously through the night and a portion of the day. The prospects are good for still more.

There is already an abundant supply of flowers. In some places the hills and the fields in the lowlands are yellow with honey-producing flowers. This says not that there are not other kinds of flowers that are in bloom, which includes the Australian blue-gum, acacias, willows, aliburne, etc.

By the side of the Pacific Ocean, when I go when I have the time (an electric car line a step from in front of our office runs direct to Old Pacific in about 40 minutes), and on the very edge of the ocean I find an abundance of honey-producing flowers. Over home, where it was a week ago, I found my bees working with a will. Some colonies were on the point of swarming. As the apiary had not the attention of the famer as the colonies were in the same floor of the house, I found that some of the colonies had gone the way that bees are apt to go when not properly looked after. It may be possible that I may someday be able to give them some attention again. I like to look after them.

Please send us Names of Bee-Keeper who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

No. 1.—Drone-Bees and Their Utility.

Can We, and Shall We, Control Their Production?

BY C. P. DADANT.

The discussion on the utility of the drones in the hive under domestication, which was considered at length at the Paris Congress, has led to the expression of opinions from several bee-keepers in different publications on this subject, and I have concluded to bring the matter before the readers of the American Bee Journal with the hope that it may lead to further investigations and experiments. It is my intention, if permitted, to explain the subject at length, so that even beginners may see and understand the importance of the proposition set forth. So I will expect to develop the matter in two or more articles.

That the drone is an idler we all know, even those who have but a very faint knowledge of his physiology, for the name "drone" is proverbial as designating a useless being. And so, as the beginning of two or three thousand years, Mr. Aitho Butler, [a writer on agriculture and bees], described the male bee as "a gross, stingless bee, that spendeth his time in gluttony and idleness....worketh not at all, either at home or abroad, and yet spendeth as much as two laborers." We all know that the drone flies out only when the weather is high and the weather warm; that he does not go out in search of honey, never goes into a blossom, but only roams about for pleasure, and always comes home to eat. We also know that he occupies a great deal more room in the hive than his sister, the worker-bee, for the cells in which the drones hatch measure four to the inch, while the worker-bees measure five to the inch. Thus one square inch of worker-bee comb can hatch 25 worker-bees, while a square inch of drone-comb can contain only some 36 drones. Aitho Butler said that they eat as much as two of the workers, it is not likely that they spend so much, but it is probable that it costs as much food to rear and hatch the drones in a square foot of comb as it costs to hatch the workers that occupy the same space. This looks to me quite a reasonable presumption, and, in the absence of actual evidence we can take it for granted that 5,000 drones cost as much food to become perfect insects as 7,500 workers would cost.

In his physiology the drone shows the purpose for which he is made, by the differences existing between him and the other inhabitants of the hive. Aside from the difference in the sexual organs, the drone shows a much greater power of vision by the extraordinary number of facets in his compound eyes, numbering, according to Cheshire, as many as 13,000 on each side of the head, while the facets of the compound eyes of the worker-bee number only about 6,300. It is evident that the purpose of this extraordinary vision is for the finding of the young queen while on the wing, since it is of great importance that she should be enabled to meet with a drone at her first flight, for the life of the colony usually depends upon her successful mating and prompt return. It is certainly also for this reason that so many drones are reared in the hives during the swarming season. If only half a dozen or so of drones were reared, it would be very difficult for one of them, and several repeated flights for this purpose would endanger her life the more. But the drone plainly shows that he was not born for work, by the shape of his legs, which have none of the pollen-baskets that serve the worker-bee in bringing in a load home, and by the shortness of his tongue. His proboscis is not made to lap honey out of the blossoms, but only to suck it out of the store-cell, so the poor fellow is surely not to blame if he is lazy and idle. He only follows his destiny. But his faculty for flight is remarkable, since altho his bulk is only one half more than that of the worker, his wing-area is to that of the worker as nine is to five. This is another instance of his adaptability to the purpose of his existence. The mating with the queen taking place only in full flight, it is necessary that he should be able to overtake her, and the natural law of intermixture between different families.
makes it imperative that the mating should be between queen and drones of different colonies.

A short flight on the part of both queen and drone would lead to the possible mixing of inhabitants of the same hive—brother and sister—and Nature carefully avoids this in all beings.

The natural, instinctive knowledge of the necessity of having drones in the hive, is a strong market in the worker-bee. Drones are rarely kept longer than in normal conditions—they are usually killed, or driven away at the end of the harvest, yet we all know that if a colony remains queenless, its bees will not only fail to kill the drones, but they will even accept drones which have been driven out of other hives. This I know from personal experience, for I have seen Italian drones, late in the fall in a queenless hive which contained only black bees. These drones could not have been reared there, but had evidently come to it when driven from their home, and the bees, altho having no possible use for them, had accepted them. It is plain, that realizing the part the drones play, and, in hope of securing them, they keep the drones with them in the expectation that they may be needed. It is in part also for this same reason that a queenless colony builds only drone-comb.

Unless a queen is old, or unhealthy, or unfertilized, she will not lay drone-eggs until the colony is already well supplied with drones. She will keep over drone-comb, and carefully select only such cells as are suitable for worker-bees. This shows conclusively that she does not like to lay eggs in drone-cells. As her eggs are fertilized only black bees. These drones could not have been reared there, but had evidently come to it when driven from their home, and the bees, altho having no possible use for them, had accepted them. It is plain, that realizing the part the drones play, and, in hope of securing them, they keep the drones with them in the expectation that they may be needed. It is in part also for this same reason that a queenless colony builds only drone-comb.

This ability on the part of a female insect to lay eggs that will hatch altho unpregnated, was discovered in the honey-bee by the famous Dzierzon, and has long been disputed as incorrect. It is called "parthenogenesis."

But when she has been laying a great number of worker-eggs, the queen very probably becomes tired of this function, and as the eggs keep coming she seeks rest by hunting for larger cells and laying drone-eggs. This would explain why, at certain times, she will hunt for drone-cells. As a matter of course these likes and dislikes of the queen are all presumptions, but the evidence is very favorable to the views we take, and even slight circumstantial evidences lead to the same conclusion. For instance, a young queen that is healthy and vigorous, will lay a much larger number of worker-eggs than a queen that evidently feels well and enjoys it. That a queen can not usually lay worker-eggs in drone-combs was evidenced by an experiment made by a Mr. Drory, of Bordeaux, France, some 20 years ago. A swarm was supplied with nothing but drone-combs. For quite a number of days no eggs were laid except a few drone-eggs, and finally the worker-bees reduced the outer opening of a number of drone-cells so as to narrow them down to the size of worker-cells, and the queen laid a few eggs in them.

In my next I will consider the reasons which cause worker-bees to build a greater or lesser proportion of drone-comb in the hive.

Hancock Co., Ill. [To be continued.]

The Matting of Queens in Confinement.

BY J. S. DAVITTE.

REPLYING to an inquiry as to how I got queens mated in confinement, I will say that I built a large tent, 30 feet in diameter and 30 feet high, the covering being of muslin. The colonies of bees were suspended with wires. The drones were placed close up against the wall of the tent, on the outside, each colony being allowed two entrances. One entrance opened outside of the tent, and was contracted so the bees could pass in and out, but not the workers to pass out and in, and work in the fields in the usual manner. The other entrance opened into the tent, and was large enough for the passage of a queen or drone, but kept very close by a large piece of glass. The queen was placed in position. This was done for the purpose of educating the workers to use the outside entrance. The drones were not allowed to use the outer entrance at any time, nor to enter the tent except from 11:00 a.m. until 1:30 p.m. After the drones had learned the bounds of the tent, they seemed contented, and made a pretty "flying school" flying in the top of the tent.

I wish to say that drones are the main feature of this problem. Once you get them quiet and reconciled to fly in the top of the tent, the problem is solved. Nine times out of ten the queen will not reach the top of the tent before receiving the most prompt and gushing attentions.

After I got the drones under control I had no difficulty. I simply turned the queens from the hives they were in, just the same as I turned in the drones. I one year reared over 100 queens and drones. A tent was kept close to where the queen would leave the mouth of the hive, and return in about five minutes, apparently mated; and in three or four days would be laying; and the progeny of all queens thus mated showed the same markings as the workers of the colonies from which the drones were taken.

The workers seem to be more annoyed than the drones when they find themselves confined in the tent; and I aim to keep them out of the tent as much as possible by not opening the tent-entrance until nearly noon, when most of the workers are in the field. As a further precaution, the tent-entrance is kept shaded or darkened.

The queens are not turned in until the drones appear to be well satisfied to be in the tent. As soon as they are in, in this condition I believe that 500 queens a day might be mated in such a tent. Where queen-rearing is carried on upon a larger scale, I believe that this plan would be preferable to the open air; as I have seen a young queen who have opened the hive and placed under the bees, and the drones around the queen three times, and be gone 15 minutes each trip, returning at last unmated.

My plan for queen-rearing is as follows: I choose a colony from one of the colonies from this colony I remove the queen, and allow the bees to build queen-cells. At the same time I make queenless such colonies as I wish to break up into nuclei. Two days before the queens will hatch, I form my nuclei, cutting out and destroying all cells, and arranging the nuclei on the bottom of the mating tent. The queen-cells from the choice stock are then cut out and given to the nuclei, the outer entrances contracted so that no queen can pass, and the inner entrances closed entirely. After the young queens are two or three days old, I open the tent entrances at 11:00 a.m., and leave them open until 1:30 p.m., each day, for several days, or until the queens are mated.

Now for the drones: At the same time that I remove the queen from the choice stock for the purpose of securing queen-cells, I place several hives that are strong with select drones around the wails of my tent, with the outer entrances contracted, as already explained, so that no queens or drones can pass, and the tent is opened and left open until 130. With this daily exercise in the tent for 16 days, I have my drones tamed, or accustomed to their surroundings, or under control, so to speak; and it would interest a bee-keeper to take his place at one of these tents and see the drills, the workers, who, Bird-like, are "willin." I have seen the mating take place before the queen could reach the top of the tent. Before they separate, the queen and drone fall head over to the ground, and the queen goes directly to her home that she left not three minutes before.

If I were to build another mating-tent, I should build it about as follows: I would secure 12 tall poles. I would have them at least 30 feet long—40 would be better. These poles I would fasten firmly in the ground, each at a center; From pole to pole, at the top, I would stretch No. 10 wire to keep the poles true and in place. I would also brace the poles from the inside; and the braces would be allowed to go up 20 feet on the inside, as the drones use only the upper part of the tent. At the top of the poles I would also stretch No. 10 wire from each pole to its opposite neighbor, thus strengthening the structure and furnishing support for the covering that goes over the top. I strengthen every part of my netting, giving it an extra turn about an inch in width. This allows me to stretch the covering very even and tight without tearing it. Common boards can be used around the bottom to the height of five or six feet. At noon the tent should have the appearance of a "Keck's" review.

Polk Co., Ga., Jan. 22, 1901.

[Editor Hutchinson has this comment on the subject of mating queens in confinement.—Ed.]
ignis-fatuus. If you wish to see a bee-keeper draw up the corners of his mouth, mention this subject. When this subject was first brought up it was looked upon in all seriousness late. It is mentioned only with ridicule. The man who will properly propose, within the limits of this line would be clast with the man who is trying to invent perpetual motion.

Seriously, is it wise to discourage attempts in this direction? There is no doubt that there is as much difference in bees as there is in other domestic animals; and the one thing needful to enable us to develop strains of bees superior to those that we now possess, is control of the mating of the queens. Where would our short-horns, Jersey, and Jersey rocks be now if the mating of these animals had been no more under our control than is the mating or our queen-bees? The next great step that we ought to take in all efforts to secure control of the mating of the queens. It is of sufficient importance to deserve much careful experimentation.

A Mr. LaVake, of Florida, wrote me that he thought queen-breeders might do away with the sending out of so many misnamed queens if they would have them mated in confinement. I replied in the usual strain that it had been tried and abandoned as a hopeless task. I asked him to let me know who had ever tried it, and made a practical success of it. He gave me the name of Mr. J. S. Davitte, of Georgia. I wrote him as soon as I received your letter, and in this correspondence I have gathered, arranged and condensed his article. The reading of the letters from Mr. Davitte aroused my interest to the highest point. He writes in such a graceful manner so thoryly, that he has convinced me of his success.

I have spent considerable time in looking up and reading everything that I could find upon this subject. As I looked into the problem, the principal trouble has been that the drones have not been brought under control. When a drone has been accustomed to soar away thru the blue ether for miles and miles, he is not going to be shut up in a little 30-foot tent and be contented. For a long time, at least, while the queen is sending winged offspring all over the land, he is in no mood to pay his addresses to a queen. Catch two wild birds matting-season, and shut them in a cage. Do you suppose they would mate? Canaries have been caught inside and kept for months, and no mating occurred in a cage. Mr. Davitte had his drones flying for days in his tent before any queens were released in the tent. Perhaps many of those drones had never flown in the outside world—new thing of it. Having flown for several days in the tent, they had almost returned to the condition, normal and ready to mate with a queen should one appear.

Suppose we could make a cage two miles wide and had a mile of flight before a queen was to be mated inside such a tent? Suppose it were reduced to one mile in width, and one-fourth of a mile high. Don't you suppose it would be a success? The question then is: How could it be done? Mr. Davitte tells me that he thinks that the size is not so very material as it is to get the drones to fly and feel at home. One large enough for that is, in my opinion, large enough. Mr. Davitte, who has had experience, puts it at about 50 feet in width and 30 to 40 feet in height.

There is still one more point: Not all drones, at all ages, are capable of fertilizing a queen. Many have failed from not understanding this point. They have put nuclei, with a mating-queen, into a tent, and then caught drones at half-hazard and put them into the tent. Some of them may have been youngsters, just out of their cradles, so to speak. Others may have been "old greybeards." All of them would be inclined to think that they had been caught and shut up in a tent away from their home. I think that Mr. Davitte has found the key that will unlock the problem, viz.: That of getting drones from a normal colony, that is, working undisturbed in the open air, to fly away from it. If you knew that they were going to be used, you would make it of small value. The queen-breeder who will build such a tent, and succeed with it, will certainly have one of the biggest advertisements that could possibly be secured for a queen-breeder. I wish that some one who is in position to make the experiment would build such a tent and give the matter a fair trial. Even if it should not prove to be the brilliant success that is reported by Mr. Davitte, it might be a start, or a beginning of something that would eventually lead to success.

Don't let us lose our heads with enthusiasm, nor toss the matter aside with contempt and ridicule. With the new school of bee-keepers there are numerous who will go through a thorough trial, standing ready to meet either failure or success.

**Can Almost Any One Keep Bees?**

**BY A. C. SANFORD.**

W**#**O may keep bees? The professional certainly may because he has the skill and the money. The amateur, who turns and turns, the successes and losses, and knows how to make the best of them. But the many who would like to keep a few colonies in order to get a family supply of the delicious and wholesome God-given sweet, lack the experience often to make a success. Of course, almost any one can learn how to manage the swarming, and how and when to put on supers; and, last but not least comes the wintering problem. Most Northern bee-keepers prefer to winter their bees in the cellar or a cave, as it takes far less honey and is generally the most successful plan—at least in Wisconsin. In these days we have text-books on bee-culture and all the science and mysteries of the honey-bee can be learned, but the actual practice and experience is another thing.

I well remember my experience with the first colony of bees I ever had. It swarmed only once, then the parent colony became destitute of a queen. I told a neighbor that I thought something was wrong, but he thought not because the bees were carrying in pollen. Later I found that the queen had an imperfect wing, had never met a drone, and produced only drone-eggs, so I lost the colony. The following spring I purchased two colonies in box-hives, and transferred them into movable-frame hives. It was then I first attempted to make a swarm by dividing, and the bees swarmed out; but I soon learned a great many things and managed my bees successfully.

Many people would keep bees if they were not afraid of the stings. Of course there are some to whom the sting of a bee is poisonous, and they will do well to let bees alone. But such people are few, and if one intends to keep bees he must make up his mind that he is going to endure the stings, and in due time his system will get used to them. The pain may be relieved with wet salt, hortshorn, mud, etc., or by quickly pulling out the sting. If one is careful he will be likely to think that the danger is over, and thinks that he never will be stung he is very much mistaken.

Two very essential things in handling bees are a bee-veil and a class-smoker, with an ample supply of smoke-making material. If you will be induced to try bee-keeping and if you will go along experimentally and not angrily give them a generous dose.

Women-folks can learn to care for bees as easily as they do for chickens, if they only have the courage and the pluck. It is much easier to learn to keep bees than it is to learn to play the piano. And then think of the delicious honey you will have to sell and to eat.

—Pierce Co., Wis.

**A South Dakota Bee-keeper and His Little Aiplty.**

M**R. EDITOR:** Being a reader of The American Bee Journal, I presume you would like to hear something about how one of its pupils is getting along. I was just on the meridian line (in age) when the bee-fever struck me, having spent most of my life in Chicago, and other cities. I am sorry now that I did not start keeping bees 25 years earlier. When I came out here I told my neighbor (an old bee-master) that I intended to keep bees, and he told me that they might live all right providing I would feed them all summer and give them enough in the fall to last them all winter. Happy the man who thus expects but little, for he will never be disappointed.

I found out that this is a very poor country in which to keep bees, for we have the little Aiplty. It makes me as hopeless as that amount to anything. We have dwarf sunflowers in abundance, and they furnish a little honey of an inferior grade. Sweet clover grows tall if irrigated, but on waste land or on the roadsides it doesn't thrive. I tried buckwheat, but the bees did not work on it, and, besides all this, the wind blows here sometimes so furiously that if the hive-entrances were the size of a stovepipe the bees would hardly be able to reach them.
Mr. L. H. Cremers and his Apiary, of Davison Co., South Dakota.
A Fair Italian After "Black Beauty."

By Henry Bidwell.

I am a yellow honey-bee of the feminine kind. My occupation is to secrete wax and build it into combs; to gather the nectar from the flowers, and to store and digest the nectar, upon which to feed the maturing brood or to partly digest and give to the mother-bee for the rapid formation of eggs. The rule that governs the actions of my life is that whatever is to be done and you do not in doing. My mother is called a queen, but from her numerous progeny they more appropriately be styled a "mother-bee." My father is called a drone, but since he has no sac to gather honey in, no basket to carry bread in, and no stinger with which to defend the hive, he is called the "innoman-bee."

Mother and I, and 15 of my sister workers, came from Genoa, Italy, in a small box by mail. We had a quiet trip across the water, but were badly shaken up in transfer at New York City, then rolled across the country to our present home, where we revel in the immense fields of alfalfa bloom, which we prefer to the fragrant groves and sweet-scented vineyards of our native land. This is the home of the industrious bee; here we enjoy the right to swarm when we wish to, as Nature intended we should. To swarm naturally is the greatest happiness that comes to us. God's way is better than man's way, at least, for our increase.

In Italy we no sooner thought of swarming than our mother was ready as a rule. We were compelled to replace her from worker-larvae which were crowded in small cell as coarse food; thus our step-mother came to us with her size reduced, her color darkened, the number of her ova diminished, and her vitality largely destroyed. Again, the German bee, which was imported into the United States, would have operated our stock, left the brown stripes on our abdomens and inferior blood in our veins. But in America it was discovered that our race was variable, and by careful selection the brown stripes are being discarded.

It was a beautiful March day when we arrived at our present home. The bees, whose apiary we were to share, were returning laden with pollen from the maples. The box in which we were imported was placed in a strong colony of brown bees from which the mother-bee had been removed. Immediately our box was surrounded by queen-less bees that vainly tried to liberate us, and which in a measure consoled us by extending their tongues laden with liquid sweets thru the meshes of our prison doors. We gladly accepted the food offered us, but were even more glad the following day when released. Mother found many empty hives, recently vacated by baby bees, and at once began to deposit an egg in each cell, including a number of brood-cells. But we were fortunate, for a week or more we began to hatch, and in four more she began to lay eggs in the queen-cells we had prepared for her.

We swarmed on the last day of May, just as the workmen were going in to dinner after having mowed the alfalfa. We were all and hungry and handsome in circles that grew larger until we were nearly all out, then you would see brown bees mingling joyously; then the queen settled on a maple limb where we all clustered, bending the limb almost to the ground. We waited patiently for some one to hive us, but getting tired, sent out scouts in search of a suitable place to live. Soon one returned saying she had found an empty barrel; another saying she had found an open space between the siding and plastering of a house; another reported finding a hollow tree, and still another a small stone house which had never been occupied, for the padlock was sealed with rust. This seemed the most suitable, for our number was tens of thousands and we wanted plenty of room to work. The other bees by the scout, to the little stone building on a vacant lot near the center of town. We entered thru a crack on the door and immediately went to work. A few mud-wasps and spiders took possession of the house (which, by the way, was the calaboose) each year. The place was built up and account of there being no saloon in town it had remained vacant and we were left undisturbed.

In the course of a month we had built ten combs the size of a bushel basket, suspended from the ceiling down into the thickness of the house. On July 4th the door was opened with difficulty, and a tramp was thrust in. He lay in a heap on the floor until towards morning when he got up and began to swagger and swear; striking out in the dark with clenched fist he knocked down our combs, scattering them all over the floor. Amid the yells of murder and fire we ran in every direction until we reach the sides of the room; then we climbed to the ceiling again where we clustered. As soon as the light was sufficient we flew back and lit on a limb near our old home, which we found had been divided into ten parts—just the number of combs we had left in the hive. Each part had been placed in a separate hive and given one of the sealed queens which now were mother-bees.-looking about, we found an empty hive which we took possession of; and before winter we had it full of combs, honey, bee-bread and maturing brood.

Sedgwick Co., Kan.

Questions and Answers.

Conducted by Dr. C. C. Miller, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail. —Ebrook.)

Transferring Crooked Brood-Combs.

I have six colonies of bees in the cellar. They are in frame hives without the frames, except three, but the comb is so crooked that I cannot get them out or do anything with them. Will it pay to transfer them on frames of foundation?

Iowa.

Answer.—Wait till they swarm; hive the swarm on the old stand, setting the mother colony beside it. A week later lay out the old queens, because of the large number of eggs in the hive, and the time of swarming drum out all the bees and add them to the swarm. Then you will have the old hive free from all brood unless it be some drone-brood, and you can do what you like with the combs. The swarm having an extra force of bees ought to give you a lot of surplus honey, if there is any to be had.

Methods of Securing Increase.

1. I wish to get my increase the next season. My plan is this: in early swarming-time I think of taking the colony I wish to breed from, and take two frames with bees brood and queen, fill both up with empty frames with starters. Put the hive with the queen on the old stand; when the other has reared queen-cells within a couple of days of hatching, I divide as many more as I have spare queen-cells in the same way, placing the queens on the old stand and removing the queenless ones to a new place and give them a queen-cell. Will that plan work well? Will the bees destroy the queen-cells? Would I better give them the cell at once or wait a couple of days? If you think this plan will not work well, will you please give me a better one?

2. I have some extracted honey which fermented and then candied. Will it do to feed to bees in the spring if I liquefy it?

3. Since writing the above I have been reading an article by Mr. Doolittle in the American Bee Journal; he is good authority, and he advises against giving a queen after dividing, giving as a reason that it will bring on a crop of workers too late for the barley, and prepare the way for another swarm. His reasons seem good. Please give me what you consider the best system of dividing. I wish as little increase as possible.

Iowa.

Answers.—1. Instead of putting the queen with two combs on the old stand, and the queenless colony on a new stand, why not leave the queenless bees on the old stand and put the queen with her two combs on a new stand? The queenless bees will then be in a more flourishing condition and rear a better swarm, whereas by the way you propose they would be weak in bees and gathering no honey. Then when it came time to use the queen-cells you could return the queen to the old stand. The bees will be likely to destroy the queen-cells unless conscious of their queenlessness. It would be a good plan for you to take the queen from the colonies you intend to use for nuclei two days before, then when you put them in a new place as nuclei they will stay better where they are put, and the queen-cells can be given to them at the same time. But remember that when you make a colony queenless not all the cells will be good.
Some of the last reared will be very poor. Better give each nucleus two, three, or four cells, and there will be a better chance that there will be at least one good one in the lot. You can also judge something by the looks of the cells, the large, well-filled ones being transferred, although sometimes an inconspicuous cell may contain a healthy larva.

2. It will do very well. In spring, when bees are flying daily, it is safe to feed almost anything that bees will take. Possibly sweetened vinegar would do no harm.

Answer.—If you are in a hurry to extract the honey of a colony, and not enough time is at hand to allow the bees to make a pollen storage, you can hasten the working of the combs by feeding them sugar. If you have a queenless colony or a few bees, you can feed them sugar and the “run” will be made.

All the bee-keepers in this county (Davis), and a great number in Salt Lake County, will not use the extractor, claiming it does cause foul brood.

Utah.

Answer.—If there are no thistles growing on your place, there are two ways in which they may be introduced through the use of an extractor. A queen, alvei, and a spore are its seeds. Please get that clearly in mind—there must be the bacillus or the spore, or there can be no foul brood. The bacillus or the spores may be found in the honey, in the pollen, in the comb, or in the soil. The lice, roundworms, or the invaders in the honey is the thing most to be guarded against, for it is probable that in the great majority of cases it is the honey that the disease is carried.

Your question refers to whether the extractor causes foul brood. If there is no foul brood in your apiary, how can an extractor cause it? The extractor can produce neither spore nor bacillus. If, however, there is foul brood in one of your colonies the case is a little different. You may not be able to extract the honey of that colony, and the honey may be infected. You put a comb from the infected hive into a sound colony, and you have another case of foul brood. You put the combs of the infected colony for the bees to clear up after they have been extracted, and there is a chance for every colony in the apiary to get the disease. If you feed some of the extracted honey for any purpose (and the chances are that you are more likely to feed extracted honey than comb), there is a fair chance that any colony that fed will have the disease.

You will probably see now that the answer should be: There is no possibility that the extractor can produce foul brood where there is none; but if there is a diseased colony in the apiary it is quite possible that bad management in connection with the use of an extractor may greatly accelerate the spread of the disease.

Dead Bees Outside the Hive—Colony Destroyed by Moth.

1. Why is it that after a warm spell followed by cold, that a great number of bees are found dead outside of the hive?

2. Is it safe to use a hive after all the bees in it have been killed by the bee-moth? I caught three swarms myself, one of which was afterward destroyed by the moth.

New York.

Answers.—1. I should expect it to be the other way: after a cold spell when many bees have died, the advent of a warm spell allows the bees to carry out their dead.

2. The hive will not be injured in any way, and it will be perfectly safe to use it again. If you mean to ask whether it is safe to use the combs, the reply is that it will be all right to use them unless they are so badly destroyed that most of the septum or middle wall is gone.

I don’t know whether you mean literally that the bee-moth killed your bees, but as it is a rather common belief among beginners that bee-moths may attack a good colony of bees and overcome it, it may be well to say a few words about it. No bee-moth ever came off first best in a hand-to-hand struggle with a worker-bee. If you watch closely, you may see a moth toward evening trying to enter a hive, and if a bee gets after it there is no attempt at flight. The moth runs, and if the bees get hold of it has no means to defend itself, let alone trying to kill the bee. The moth tries to get into the hive to lay eggs, and laying eggs is all the harm it does, although it is harm enough. If bee-moths are plenty, you will probably find their eggs in or about the hive in the evenings. When these eggs hatch out into larvae, the larvae or wax-worms make a business of eating the combs, and that’s where the mischief comes in.

When these wax-worms are allowed full play, it will not be very long a time in hot weather until the whole contents of the hive will be a mass of webs and cocoon, hardly anything in the semblance of a comb being left. But in the majority of cases it is no more right to say that the moths or the worms destroyed the colony than it is to say a house maggot destroyed a house that one finds filled with maggots, the horse having been shot some time before. The colony has in some way come to naught, and then the worms come in to make a finish of the combs, just as the maggots come to roost.

Altho there may be eggs of the moth in the best colony you have, yet they do no more damage than the weed seeds that are found in your best cultivated ground. You keep the young weeds killed down before they get big enough to do any harm, and in the same way the bees keep the young worms rooted out before they get big enough to amount to anything. A strong colony will have no trouble in keeping the worms cleaned out, and even a weak colony will be all right if the bees are Italians.

Combs that have been out all winter so as to be frozen are sound until the summer, and are sound enough for fresh eggs to be laid in them. But if a colony dies in a hive, the combs will be ruined as soon as warm weather approaches. Put such combs under a strong colony of bees, and the bees will take care of them safely.

Sowing Cleome and Buckwheat.

When is the proper time to sow cleome seed?

When would be the time to sow buckwheat to have it bloom the first of July?

West Virginia.

Answer.—I don’t know the answerer to either of your questions, but I’ll make a guess at them, and if I’m wrong some good friend will correct. Sow cleome as soon as frost is out and the ground fairly settled. To have buckwheat bloom the first of July, sow the first of May.

When to Put Bees Out of the Cellar.

When ought I to take my bees out of the cellar, in this section of the country? And should they be put in the same position and place as last year?

Illinois.

Answer.—You will not be far wrong to go by the blooming of the clover. When the clover is in bloom, it is time for the bees to be out. Sometimes, however, the weather will be so cold and wet that it is better to delay a little if the bees are in good condition. On the other hand, if the bees are very uneasy, and are spotting their hives, it may be better to get them out the first favorable day. It is important to have a fine day for bringing out. After their long confinement they are anxious to get out of the hive, and if brought out on a bad day thousands of them will be lost. After lying idle for months they can not be expected to fly with the greatest vigor, and a strong wind will beat them to the ground never to rise again. Bring them out on a still day with the sun shining, and the thermometer at 50 degrees or more.

Having some years put my bees on the stands they occupied the preceding year, and other years having set them around promiscuously, I do not see that it makes any difference. Possibly in places where they are kept in the cellar a month or so, it might make a difference.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of $1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.
The Afterthought

The "Old Reliable" seen thru New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

THAT MAGNIFICENT QUEEN PHOTOGRAPH.

I am inclined to get enthusiastic over that magnificent photograph of queen and egg on the front of No. 9. Between "approximately correct" and "correct" is a long and important step. One of the great, grand things that we want of the twenty-first century is to take away our approximations and give us some reals. For instance, let it take away our good novels, which are approximations, and a lot of our biographies, which are not so much as approximations, and give us some real views of other lives than our own. Well, here we have a real look at the queen on paper, can see the gloss on her back, and the fur on her shoulders, the exact shape of her foot, and the style of her "horns" (a la Utter); can see that the true taper of her abdomen does not look like a wooden plug whittled out; can see the three little eyes on the top of her head, sticking up like crab's eyes, and ready (if they do utilize X rays) to locate just where the last egg on the other side of the comb was put.

SINGLE-BOARD COVERS, WIDE FRAMES, ETC.

I agree with Mr. Greiner that the single-board cover is not an improvement on the old telecope roof. Also I like the old wide frames for putting on sections. As to the old honey-board, I'll let some other fellow agree with him about that—doubtless "other fellow" will not be very hard to find. Page 89.

A LESSON ON THE LAMP-STORE.

Friend Roe, You ought to know
30's too low
See's to go.

If you had known all that "with your heart," and had properly meditated on it last fall, perchance the treacherous lamp-store would not have been invited to do its worst. Now sit at my feet while I shake my finger and tell you. Lamp-stores are not to be trusted even if they are friends. Never should be left alone long. Liable to chair their own wicks, and get up such a state of things internally as will set up an impromptu lamp-black factory—if not worse. Set up there. Don't want anything worse. Whatever is to be seen to that purpose were "controlled" by the smoke and kept in their hives. O smoke, thou art a daisy! Some angel (sister to the one that gave the moss-rose its moss) surely gave thee bee-controlling powers. Page 89.

ALTERNATION OF RAINFALL IN CALIFORNIA.

Ten years of California rainfall shows up as a regular alternation of first scant and then plentiful, except that 1899, which should have been plentiful, was instead the most scanty of all—as if some cause, not connected with the law of alternation, had knocked it completely out. Page 90.

A CHIDER CHODE A LITTLE.

Mr. Carizen, page 91, chides Dr. Miller for not being explicit enough, and then proceeds to sin much more deeply and darkly himself. (No wonder we do just scuffle scolding: The privilege of being is just that of quicksilver—and can not be his meaning. We would grasp at the theory that 20 is merely a slip for 200 hundredths, that but that would be lighter than any fluid we have to do with. Perchance it's the arbitrary numbering of the scale on some little insinuation he has; but how are we to know that unless he tells us?

SWVRING-ECOCENTRICITIES.

The eccentricities related by Edward Knoll, page 92, seem to me to be instructive. Bees without a queen do not swarm, but a swarm left without a queen comes back soon. Here having gotten themselves partly on the end and partly on the roof of their home, they played that home hadn't any queen, and kept up the illusion for more than a week, not ready yet to give it up when the second swarm issued, but "saw the point" when the third swarm appeared. I surmise the old queen came out when she did because the bees had recently been worrying her—for them to kill her would be rather the normal course, I think.

Perhaps the Frenchman was right.

Mr. Badant, may it not be that that French manager was partly right? I mean about the non-advisability of working second-hand wood with power. Even here when a railroad wagon is tied sawed up men do it by hand with big saws. Too many gravel-stones that have work into cracks for buzz-saw work. Feeding a power saw allows too little time to "watch out!" and it can not be stopt when it strikes a stone.

Page 100.

MAKING A COLONY SWARM.

Well done, Mr. Revels! A practical way to make a colony swarm at will is one of the most urgent of our lesser wants, and you seem to have given us a good starter toward it. Booming colony—tall hive—queen in the attic—zinc to keep her warm—then just put her in the back, and most thoroughly ripened, select honey will keep is perhaps a little problematical yet. And his contribution 15 years in an open package, and good yet—is on the road toward finding out. As a general discipline I would say that honey not yet properly appreciated at times it is like the queen. There might be some failures, however. A phlegmatic colony might refuse to build cells below: and an irascible colony might kill the old queen when she appeared downstairs, and only save one princess. Page 101.

KEEPING EXTRACTED HONEY.

Dr. Mason was a little "off" on page 102 when he said it had never been tried how long extracted honey would keep. I've tried it a number of times when it didn't keep thru the first winter. How long it would keep is hard to say. The right, and most thoroughly ripened, select honey will keep is perhaps a little problematical yet. And his contribution 15 years in an open package, and good yet—is on the road toward finding out. As a general discipline I would say that honey not yet properly appreciated at times it is like the queen. There might be some failures, however. A phlegmatic colony might refuse to build cells below: and an irascible colony might kill the old queen when she appeared downstairs, and only save one princess. Page 101.

THE HATCH EXPERIMENT.

And ye experimenting folks, don't forget the Hatch experiment when putting on supers this spring—filling all the mid-frame-chamber with sealed brood, and having plenty of young larva in the outside frames. For locations with only one harvest, and that not very long, I shouldn't wonder if this might prove valuable. Worth something to start the storing in the outside sections, right over the young brood. Page 105.

BUMBLE-BEE DRONES WORKING.

Mr. Wallace, perhaps it is not very great merit in the bumble-bee drones that they work to the extent of getting their own food from the flowers. May be a simple case of "root hunger or die." It's true, however, that our hive-drones would promptly accept the "die" rather than the "root hog." Page 108.

UNCAPING HONEY FOR EXTRACTING.

I am not an expert handler of the uncaping-knife—good ways from it, I fear—and therefore the photograph of an expert at his work has special value to me (and perhaps to all my numerous family.) I am talking now about the photographs of Mr. Aikin on pages 117 and 118. He does not lean his comb over to the right as much as I do. He cuts the first stroke on the near end of the comb. Had I been in his shoes, and commanded to begin on one end, I should probably have cut the first stroke on the far end—working the heel of the knife continually into fresh territory in preference to the point—except of course when the surface is so uneven that the point has to be used. While ago I used to take off a little strip pretty much all around the comb first thing; but I have pretty well abandoned that as a greenhorn's unfulfilled craving. Had I been in Mr. Aikin's shoes and told to uncap that comb just as I pleased, I should probably have set it on one corner, leaned it over strongly to the right, placed the middle of the blade under the bottom comb and made the first stroke into the opposite or upper one. Then the rest of the territory I should have finish in a "permisive" kind of way. Presumably, Mr. Aikin's way should be the better—but I should greatly enjoy hearing other brethren just attack a comb—or, if they pleased, just how they would go at that particular comb which Mr. Aikin has in his hands.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.
INFLUENCE OF THE GOOD HOME.

The home is the greatest civilizer. A nation of good homes must be strong. Nothing will foster patriotism like the presence of innumerable homes where the beauty of the outside is equal to the beauty of the inside; and in such homes the home more beautiful, or anything that adds to its delights, not only makes good people—good fathers, mothers, children, good neighbors—but just as truly, good citizens. The man who has the home all to him, who longs for it when absent, and lives himself to it when business lets go his grip, who is only away from it when stern duty calls, who rejoices in it from cellar to roof—such an one feels that he has great things to live for. He can accomplish great things, for he has a heart light with joy, he has wondrous incentive to work—thought of the loved ones that make that home so precious: his daily tasks are only pleasures. Such are the ministries of the true home. Such a man must be a patriot—he has that which he must defend.

The happiest homes, are where all work together to secure comfort—where all give thoughtful love and rejoice most in what brings joy and good fellowship to all. It is not the home of wealth, where money and belongings every luxury, and gratification in fullest measure comes without effort, that knows the truest happiness. Such homes breed selfishness, and selfishness and happiness never travel together. I would never covet wealth for my children or friends. I would covet them only for the noblest and mightiest. Such a state of mind will be born of wealth. The man of wealth may hold upon generous purpose, unselfish regard, disinterested love, but his money is ever working to smother all these blessed instincts. Strong industry is the wisest and best integrative force to serve ever alive within him the highest ideals of life, thought and purpose, if wealth has ever waited at his call and responded to his beck. Not the home of wealth, then, but the home where the industry and frugality supply moderate needs, and all thought and effort must minister to the daily wants, is where joy is sweetest and best, and such homes are what will surely give to a nation perpetuity.

May we not rejoice then that our nation is blessed with such homes? That we are not all selfish, that all these noblest of actions and efforts that fosters such homes. May God raise his hand against efforts that tend unduly and unrighteously to build up either the homes of squalor, or the homes of the overwealthy.

Our American Bee-Journal home circles are the average ones. In them all minister. All are ready to give the helping hand. All are alert to add a sheaf to the store of comforts. Thoughtful love for other than self. All this is what makes glad some the heart.

In our homes, we love to read. The good book and the helpful magazine are the pride and pleasure of the household. The reading aloud, and the good talks called forth, as "Wild Animals That I Have Known," takes us into the fascinating fields of nature, are too precious and valuable to be at all curtailed. How can we gain time for more? So very important is the answer, that we may well share no time or pains to make all about the home convenient. A house-saving machine, no more so than convenience of plan and arrangement, should receive fullest heed and attention. In all this, as it is the workshop of the queen of the household—the loving wife who gives the sunlight to the home—a first place should be given to it.

THE KITCHEN.

The kitchen round of duties are every day, and many are oft repeated in each daytime. Steps that must be often taken should be short and few. Is the kitchen the cheerful room, where work is done? If not, are the walls cheerful and does an atmosphere of cheer and comfort make the kitchen a glad place?

Any pains to make the kitchen bright and attractive are well and worthily bestowed. Is the kitchen next to the dining-room, or is there a separate one, thus placing an ample cupboard, with convenient sliding or other doors that open both ways? Doors that slide either up or sideways are most convenient.

Is the sink close beside this cupboard on the kitchen side? And has it an ample drain board, and both hot and cold water that comes with a turn of a faucet? Suppose it does cost not a little, to secure all this. It is to help every day and oft-repeatedly, the dearer, the better.

Is the range convenient to sink and table? and has it a hot water tank? And does a first-class quick-heat gasoline stove take its place in the hot weather? Is it a neat wood-box close by the stove, and is it ever full of the best of fuel?

There is a lovely arrangement in the room and lovely, too, in the little of best room and lovely, to be so that all possible steps are avoided? Is there a long, narrow spice cupboard above the cooking table, with front door to open downward, that no steps shall be required to reach everything that is needed to make the food appetizing?

Is the pantry close at hand, and always stocked with all needed articles?

A husband can afford not to give all this most earnest heed. To save the time, the steps, the energy of the wife and mother, is his greatest privilege and his wisest and most blessed act. In building a house the most thought and study should be given to it, that it may be a model of neatness, beauty, and convenience. If the house is already built, labor and money spent in remodeling this room so that steps may be saved, and care, worry and labor lessened, will be most wisely used.

THE BATHROOM.

That wonderful man, Booker T. Washington, in the intensely interesting and inspiring articles just completed in The Outlook, and which is hoped will be published in book form, speaks of the bath, as a civilizing agent. He is right. No house should be without its own good and best arranged bathing arrangements. Indeed, "Cleanliness is next to Godliness." The bath—often used—is the good angel of the home. We are wise when we do everything to encourage to very frequent bathing. We must have the conveniences. Is the hot water tank heated every time the stove is lighted, gives hot water at the kitchen sink and to the bathroom.

I would work my fingers—short, if needs be, to have the best and most convenient kitchen and bathroom the county round. Have all our readers lived up to their opportunities in these directions? These should not be considered luxuries, but necessities—a thing not for the future, but for the now.

GRAHAM GEMS.

Nothing is more important in the home circle than good health. It is true that "what is one man's meat is another man's poison." White bread is often very unwholesome and, I may add, unwholesome. To any who, like myself, have found this true, I would suggest as a substitute graham bread or bread. I feel that my health, if not my life, is due to this displacement. The following is the recipe for graham crumbs which I have found very appetizing and wholesome:

To two cups of graham flour and one of white, add two teaspoonsful of good baking powder, and milk sufficient to make a thick batter. Stir it to the texture of one cup of the batter. Bake in a cup, or less, of some shape. If some cream is added with the milk, no harm will be done. Bake quickly in hot buttered gem-iron.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and thus often leaves a sale.

The picture shown herewith is a reproduction of a motto queen-button that we have been furnishing to bee-keepers for a long time. It has a pin on the underside to fasten to the coat-lapel. Price, 5c per pair, or six for 25 cents. Send all orders to the office of the American Bee Journal.
BEE-SUPPLIES! 

Don't you feel that your beekeeping is a little behind the times? This is the year for you to increase your bee supply. The catalog is filled with the latest in beekeeping supplies. Don't miss the opportunity to upgrade your beekeeping operations.

If you want the Bee-Book That covers the whole Apicultural Field more completely than any other publisher, send $1.25 to Prof. A. J. Cook, Claremont, Cal., FOR HIS "Bee-Keeper's Guide." Liberal Discounts to the Trade.

Queen-Clipping Device Free. 

The Monette Queen-Clipping Device is a fine thing for use in catching queens from hives. We mail it for 25 cents; or will send it FREE as a pre-paid order for $1.00. New subscriber to the Bee Journal for a year gets it free. Address: GEORGE W. YORK & COMPANY, Chicago, Ill.
WINTERING BEES—SWARMS SETTLING.

My bees are doing fine. I take common dry-goods boxes, having the top and bottom separate, set the hives on the bottom, put the boxes, then set the boxes over the hives, and fill in each cavity one in front of the entrance. I have tried this method several years, and have not lost a colony. I got the boxes as near 30 by 30 inches as I can, and succeeded in getting two hardware dealers to save me 57 last fall, at 30 cents apiece.

I have had several hives up in the trees every year, and have never failed to catch bees in them. The hives have been stored in and out of the hive for 42 days before they came to stay, but never knew them to take possession at once. When they had been there a few days, I have seen them hang on the front of the hive from 3 to 50 hours. If the bees settle because the queen is absent the hive will be very dry, about 4 inches to a foot of the entrance so long. I have seen them in the woods hanging just below some small hollows in a tree, and gone back in a few days and found them at work.

Last spring a swarm issued from one of my colonies, and I started off to meet it. I followed it to one of the neighboring's, where they settled on his barn, about 4 feet from the ground. My neighbor went back home with a hive and got a hive, and as we crossed the railroad track we noticed several bees flying around. I found a queen with 17 bees. This was about 40 rods from the cluster. I bought a hive and a queen—cage, put the queen in the cage, and set the hive at one side of the track, and asked my neighbor to watch the cluster, and if they entered the hive he might take them home and keep them. The second day at noon they went into the hive. Next day I went out and liberated the queen for him. They stored 24 pounds of honey and surplus, and cast one swarm. Do you suppose they were over on the barn waiting for that queen in the hive to rest? I don't think so. They sometimes have a tendency to settle in order to rest the queen, but I have caught the queen in my hand while flying in the air, after having traveled more than three-fourths of the bees had clustered.

Jasper Co., Iowa, Feb. 4.

J. H. ALBERT.

BEE-KEEPING EXPERIENCES.

I paid $8.50 for the first colony of bees I ever bought, and when I got it it was packed in a box 18 inches made of oak. Some time afterward I added a little further west, and worked for a man who kept about 35 colonies. We got the fever to go still further west, so we sold what we could and traded the balance. We sold when they went at $150 per pound, and could have sold more if we had had it.

During the civil war, while on the field of battle one day, in an old house that was full of bullet-holes, I found a colony of bees, which I gave to the good woman who had done some sewing for me. I have some relics of the old battlefield where the battle of Manassas was fought.

After the war I struck out for the West, and landed in Madison, Wis., about the middle of May, 1864. That part of the country was then a wilderness, with very few houses scattered about. I started out with two colonies of bees in oak boxes, and sold them for $240. I paid about $150 for bees by 1890, but the price has advanced to $600 and more.

You Can't Afford to Guess
at results in the poultry business. If you fail to raise the chickens, you simply have no business. The way to be absolutely sure about getting the chickens to live is to use a Cyphers' New-\n\nborer in your hatchery. We guarantee them to last 16 years and to hatch any kind of eggs. The best way to know about them is to read our 52 page (CYPHERS) book, "Poultry Keeping," Has 320 illustrations and covers the entire subject. We send it for 10 cents in stamps. Address: CYPHERS INCUBATOR CO., Chicago, Ill., Wyland, N. Y., Boston, Mass.

A Start in Life!
Everybody realizes its importance. Don't deny it to your chickens. Hatch 'em right, start 'em right, and they'd pay you back all right. Try to hatch first-rate eggs, with the famous

RELIABLE INCUBATORS AND BROODERS

The machines which have satisfied more particular people.

Our 5 Bantling Specials are absolutely the best. Our small Egg Incubators are specially made for size of egg. Our Bantling Special Incubators are made for size of egg. We will be most happy to furnish prices. Reliable Brooder Incubators, Bantling Specials, will be hard to find. Reliable Exhibition Cots are LEADERS.

RELIABLE INC. & BROODER CO.,
Reliable Poultry Leg Bands

You will not find a more reliable Eclipse Set of 10,Cats. 1-8 for all the parts. It is a wonder people can be found, and you won't catch the blue angels. If you haven't been getting good results, you're probably putting your eggs in the wrong incubator.

A great many of our poultry raisers are pleased with our Bird-Exhibitions Incubators. They seem to have been made perfect, and are sold away in the supers.

In going over them now I find quite a lot broken and a great many new, which I was not satisfied with. What would be the best thing to do with them? Shall I cut out all the comb put in new starters, or will the bees till out the combs? I had very bad luck last summer in introducing Italian queens, and
Tennessee Queens!  Fine lot of Choice Tested 4-year old hens.  All the daughters of select imported super-baited Queens, reared 3½ miles apart, and mated to select drones.  $1.50 each.  A feature of these select Queens, from same breeders, is that they have been owned nearer than 3½ miles apart, and never within 3, and but few within 5 miles.  2 years’ experience.  Discounted Contracts with dealers a specialty.  JOHN M. DAVIS, Clemons & Co., Salt Hill, TN.

Please mention Bee Journal when writing.

A New Radish—The John A. Salzer Seed Co., La Crosse, Wis., are the introducers this year of a magnificent new radish—a radish fit for use every day of the year—hence they have named it “Salzer’s Everyday Radish.” They say it is a radish worthy to grace the table of every king, monarch, president or citizen of the United States and the world. This radish, which is a variety of the rich red radish, is tender and juicy, and sweet, and crisp, as Salzer’s Everyday Radish is a cross between the two. It is sweeter than the old-fashioned radishes of the past—without their hard and bitter qualities. Not only are the Salzers introducers of new radishes, but they have a long list of vegetables that can be used for that purpose. Their catalog is worth $1.00 to any wide-awake farmer and gardener, and is available on receipt of but 5 cents postage. When writing please mention the American Bee Journal.

PAN AMERICAN EXPOSITION. Nothing since the World’s Fair, at Chicago, in 1893, has elicited the widespread interest that is manifest, all over the world, in the Pan-American Exposition. The first shipment of hives and bees from Buffalo, N.Y., to Falls, from May 1 to Nov. 1, 1901.

The purpose of the Exposition is to illustrate the progress of the countries of the Western Hemisphere during a century of wonderful achievements, and to bring together into closer relationships the people of the many States, Territories and countries of the Western Hemisphere. Acting under proper authority, the President of the United States has invited all the Republics and Colonies of the American Hemisphere to send representatives to the close of the Nineteenth and beginning of the Twentieth Century, by holding this International Exposition on the Niagara Frontier.

For this important event, the Nickel Plate Road has issued an attractive, descriptive folder pamphlet, elaborately illustrating the Pan-American Exposition, with all the necessary information. The Nickel Plate Road is the short line between Chicago and Buffalo, and affords competent train service from Chicago to the fair city. F. E. Peterson, office manager, and all points East, with trains of modern equipment, on which no extra fares are charged; also dining-car accommodations. In the baggage cars, special arrangements are made for meals in its dining-cars on the individual club plan, ranging in price from $35 to $1,000.

Call on any agent for Pan-American supplies, or the Nickel Plate Road, or address John Y. Calahan, General Agent, 111 Adams St., Chicago. Parties desiring hotel or rooming accomodations are invited to apply to J. H. McQuade, General Agent. 111 Adams St., Buffalo, N. Y.

HONEY AND BEESWAX MARKET QUOTATIONS.

Wanted

D. J. BLOCHER, Pearl City, Ill.

1001—Bee-keepers’ Supplies! We can furnish you with The A. L. Root Co’s patented Quadruple Extractor, to extract all grades of honey. We are one of the largest distributors of this machine in the Midwest. Will accept no substitutes. M. H. HUNT & SON, Bell Branch, Wayne City, Ohio.

DO YOU WANT A HIGH Grade of Italian Queens OR A CHOICE STRAWBERRY? Send for descriptive circular.

Honey market—We may have a customer within a short distance of you who wants your honey or beeswax. We are in close touch with our agents and are able to make a good market for your crop, stating quantity, quality, and lowest possible price. Reference to Mr. Blank for any business man in this city.

THOS. C. STANLEY & Son, Fairfield, I1l.

CHICAGO, March 25.—Fancy white comb sells readily at 65 ct., but all other grades are weak. White, 14¼½ ct; fancy ambo, 12½ ct; fancy comb, 9½ ct; medium, 9 ct; fdr., 8½ ct. Extracted white range from 80½ ct to 90 ct. Buckwheat, 55½ ct; Southern dark, 55½ ct; ambo, 50½ ct. 90½ ct and 95½ ct.

R. A. BURNETT & Co.

KANSAS CITY, Feb. 19.—Fancy white comb, 85 ct; fancy ambo, 80 ct; fancy comb, 70 ct; medium, 65½ ct. Demand fair, receipts in 100 cases, mostly. W. K. CROMWELL & CO., SUCCESSORS TO C. C. CLEMONS & Co.

CINCINNATI, March 9.—The demand for comb honey is nearly over, the stock of it also well cleaned up. Fancy white brings yet 10c. Extracted is in fair demand; dark sells for 55c; better grades bring 60½c; fancy white clover from 50c to 55c. H. W. WEBER.

ALEANY, N. Y., March 29.—Honey market is dull with light demand and very little stock, either comb or extracted. White comb, 15½; medium, 12½; fdr., 10½. Extracted, white, 50½; mix, 60½; buckwheat, 65½; ambo, 60½. R. W. WRIGHT.

BUFFALO, Mar. 7.—Fancy, 18½; No. 1, 14½; No. 2, 11½; No. 3, etc., 9½. Extracted, light amber, 45. Beehives 60 to 70 ct.

All grades of honey selling fairly well, and looks as if all lots would clean up.

BUSH, McCOMAS & CO.

BOSTON, March 11.—Fancy No. 1 white in carloads: A: No. 1 loc, at 1c; No. 1, 1½c. with a fairly good demand. Absolutely all dark honey this year. Extracted, white, 85½; light amber, 75½; dark amber, 60½. BLAKE, SCOTT & LEE.

NEW YORK, Feb. 19.—Comb honey is being well cleaned up on account of the severe weather which has lessened to quite an extent, on account, we presume, of the high price of the honey. Every bee ruler. Fancy white still brings 15c in a small way; fancy ambo, 10½; medium, 11½; ambo, 11½; buckwheat, 10½. Extracted桂花 very much in demand. California white honey, ¾ of a pound, $1.25; fancy white, $2.50. Beehives $10 to $15.

BEEKEEPERS’/S

BUFFALO, MAR. 7.—Fancy white comb, 15½; No. 1, 14½; dark amber, 10½; Extracted, white, 95½; amber, 52½; dark, 47½; beeswax, 75½c.

SAN FRANCISCO, Feb. 6.—White comb 130½; amber, 11½; 12½; dark, 85½. Extracted, white, 12½; amber, 10½; dark, 7½. Beeswax, 25c.

Not considering the limited quantity of comb honey last spring from California apiaries, present offer is, we think, a liberal volume and are mostly of amber grade. The market is slack but firm at the quotations. It is reported on good authority that the current crop is an average one and that dealers are not laying out in considerable quantity, which to character and size of market for the very limited business doing in the pure articles.

D. J. BLOCHER, Pearl City, Ill.

HONEY MARKET.—We may have a customer within a short distance of you who wants your honey or beeswax. We are in close touch with our agents and are able to make a good market for your crop, stating quantity, quality, and lowest possible price. Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

200 Red-Clover Queen

Offer No. 35.

On September 1st last we announced that we finally had a red-clover queen fully equal to the one we had years ago. The colony of this queen has given one of the most remarkable showings on red clover of any bees we have ever had. The queen in question is an imported one, and therefore of the genuine pure-leather-colored Italian stock. We sent out daughters from her all the season. But we did not discover her value until the clover season, second growth, came on, and then her colony so out-distanced all the other 450 that she attracted attention at once.

It must be understood that these queens are not golden yellow, neither are their bees of the five-banded stock. They are simply leather-colored Italians whose mother came direct from Italy.

Since the notice appeared regarding this queen we have hardly been able to supply all of the queens that were wanted from this stock. Many daughters of this queen we sent out before we knew her value, and it now transpires that some of the finest bees in the land are from queens we sent out early. We are now booking orders for the coming season, and make the following offer, but no queens will be furnished except those that subscribe for Gleennings, and only one with each year's subscription. All arrangements must be paid to the end of this year. Gleennings for 1911 and one untested red-clover queen, $2.00; Gleennings one year and a tested red-clover queen, $4.00; a select tested red-clover queen and Gleennings one year, for $8.00. We will begin mailing these queens in June. Orders are already entered, and the same will be filled in rotation. Do not neglect to improve this opportunity and get some choice stock, and send your order early so you may get the queen correspondingly early in the season. We are using every precaution to winter this queen safely, but reserve the right in case of her loss this winter to substitute from other select tested stock, by which we are holding in reserve, or to give the subscriber the benefit of any of our other clubbing offers if desired.

THE A. I. ROOT CO., Medina, Ohio.

GEORGE W. YORK & CO., 144 & 146 Erie Street,
are headquarters for ROOT'S BEE-KEEPERS' SUPPLIES IN CHICAGO.
Send to them for their Free Catalog.
Long-Tongued Bees
ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium
for sending us TWO new subscribers to the
American Bee Journal for one year (with $2);
or, one Tested Queen FREE as a premium for sending us FOUR
new subscribers (with $4.00).

We have arranged with one of the oldest and best queen-breeders
(having many years' experience) to rear queens for us the coming
season. His bees average quite a good deal the longest tongues of
any yet measured. The Breeder he will use is direct from Italy,
having imported him himself. Her worker-bees are large, somewhat
leather-colored, very gentle, and scarcely requiring veil or smoke.
They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—"first come, first served"—beginning about June 10th. It is
expected that orders can be filled quite promptly, as a large number
of nuclei will be run. All queens will be guaranteed to arrive in
good condition, and all will be clipped, unless otherwise ordered.

CASH PRICES of these five queens will be as follows: Untested,
$1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash ** This is a good time
paid for Beeswax. *** to send in your Bees-
wax. We are paying 28 cents a pound—
CASH—for best yellow,
upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Additions as follows, very plainly.

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey
ALL IN 60-POUND TIN CANS.

ALFALFA HONEY........
This is the famous White Extracted Honey gathered in the
great Alfalfa regions of the Central West. It is a
splendid honey, and nearly everybody who cares to eat
honey at all can't get enough of the Alfalfa extracted.

A sample of either, by mail, 8 cents; samples of both, 15 cents—
to pay for package and postage. Min. freight—one 60-pound can, 95
cents per pound; two cans, 95 cents per pound; four or more cans,
85 cents per pound. Cash must accompany each order. If ordering
two or more cans you can have half of each kind of honey, if you so
desire. The cans are box.

BASSWOOD HONEY........
This is the well-known light-colored honey gathered from the rich, nectar-laden
basswood blossoms in Wisconsin. It has a stronger
flavor than Alfalfa, and is preferred by those who like a
distinct flavor in their honey.

Order the Above Honey and then Sell It.
We would suggest that those beekeepers who did not produce
enough honey for their home demand this year, just order some of
the above, and剪。And of course FREE as a premium.

can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
**Editorial Comments.**

Prof. Cook's Review of the "A B C."—When publishing Prof. Cook’s first article of the review of the "A B C of Bee-Culture," we should have stated that his criticisms referred to the edition of 1896-1900, and not to the latest, or 1901 edition. As the criticisms read, one would naturally infer that they relate to the new edition, and not to the previous one. With perhaps two exceptions, all the matter which Prof. Cook criticised in his first article has either been stricken out or materially modified in statement. Only about half of the edition of 1899 could be revised, owing to the limited time at the disposal of the revisers, but when the latest edition (the one for 1901) was under consideration, matter which had not been changed was either rewritten or revised. So, as it happened, Prof. Cook is calling attention to certain errors and other points that needed modification, but which are not in the book now offered for sale. This is well, as only a very few, comparatively, have a copy of the 1901 edition, the great majority having former editions, which contain the criticised matter.

Prof. Cook quotes E. R. Root as saying that "digestion is the separation of the nutrient part of the food from the non-nutrient, and the conversion of the nutrient into a liquid fit to mingle with the blood." This is not Mr. Root’s statement, but a direct quotation from Mr. Thos. Wm. Cowan, and, with all deference to Prof. Cook, Mr. Root writes us that he should not know whether to accept Mr. Cowan’s or Prof. Cook’s definition even yet. When doctors disagree, who shall decide?

Regarding the statement of the poor quality of honey from apple-blossoms, so much proof was furnished Mr. Root to the effect that such honey was of the very finest quality in color, body, and flavor, that the 1901 edition contains a statement praising that kind of honey in the highest terms.

Regarding the other points referred to in Prof. Cook’s review of the "A B C of Bee-Culture," the 1901 edition either does not contain the statements which are called in question, or else said statements are modified to conform to the knowledge of the present time.

Mr. Root has sent Prof. Cook a new book bearing the date of 1901, in which he will see that his suggestions and corrections have been generally adopted; for, be it said, a copy of the 1898 edition was sent to Prof. Cook, requesting him to point out its errors or its misleading statements, which he did.

Beet-Keeping for Women.—When the statement is made that bee-keeping is just the thing for invalids and women, a quiet smile is likely to be seen on the face of the bee-keeper who works hard at his business from "dawn to dewy eve," and who lies down at night more worn out than the average farmer. He knows that bee-keeping takes work—hard work—and a lot of it. He knows that he is not invalid, and yet the business requires all the strength he has. As a matter of fact, when bee-keeping is spoken of as a business into which invalids and women can enter and rapidly make a fortune, the realm of nonsense is entered.

And yet, taken in the right sense, it is not so far out of the way to say that bee-keeping is just the thing for an invalid woman. Not perhaps for every one, but for every one who has taste and adaptability in that direction. Indeed, there are not wanting those who testify that with poor health and too little strength for almost any physical exertion, when the time comes for the merry hum of the bees in the spring, they can go to work at their pets, using up their strength to its limit every day, but every day finding that strength on the increase.

There are two reasons for this. One is that they are kept out in the open air, that of itself being enough to make a vast difference in most cases. The other reason is the intense interest that bee-keeping begets. Many a bee-keeper will readily recall the time when he had not more than five or six colonies, and when at the close of a hard day's work in some other direction he has worked an hour at his bees, and when everything was done that he could find any reasonable excuse for doing, he would reluctantly stop, with regret that there was nothing more to do. If the occupation had been almost anything else, he would have found himself so tired that he would have been glad to have shortened up the task.

The woman who enters bee-keeping with no knowledge of the business, and with no love for it, but only with the thought that she may make a fortune at it, will be badly worsted in the outcome; but if she has some taste in that direction, and goes at the matter reasonably and intelligently, she may find a delightful recreation, and with gradual increase of colonies she may add to her pin money a sum not to be despised.

The attention needed by the bees can be given at a convenient time so as not to interfere with other duties, supposing that the number of colonies is not large, and when the number becomes sufficiently large, help at other duties can be obtained. In any case, it will not be hard to get help from "the lords of creation" in any part of the work that requires much physical strength.

Mrs. Axell’s article on this subject in this week’s number will be read with interest, particularly by the women of the bee-keeper's family.

**Immune to Bee-Poison.**—One of the German bee-papers reports that "Dr. J. Langer investigated 164 bee-keepers, and found 11 of them immune to bee-poison from the start; 120 became immune after a time; and 27 remained as sensitive as ever. Some lost their immunity, and sometimes suddenly turn sickness." So says a Stray Straw in Gleanings in Bee-Culture.

Editor Root says that he has never yet met a person who is immune to bee-poison from the start— that is, one on whom there would be no swelling at the first sting. Of course, there are persons who never can keep bees, owing to the fearful effect of the poison caused from stinging. The result of the investigation made by Dr. Langer shows quite conclusively that after a time the great majority become almost completely immune to bee-poison.

When we first began to keep bees we suffered greatly from the effect of the bee-poison. We remember very distinctly being stung above the eye, on one occasion, and the next morning we could scarcely see anything with that eye. After keeping bees a few years, and being stung more or less, we noticed that the pain became less after stinging, and that there was scarcely any swelling at all. Now, when being stung, we scarcely realize it half an hour afterward, unless it is a very severe case.

**Practical Lessons for Beginners in Bee-Culture.** by Rev. J. D. Gehring, of Douglas Co., Kan., are begun in this number. There will be several of the lessons, forming a series, which we trust will be read with interest and profit, especially by those who are inexperienced and have so many kinks to learn in connection with bees and bee-keeping.

It may be true that "anybody can keep bees," but it is certainly true that anybody can not keep them profitably or successfully without making a careful study of the business. While everything can not be told in the bee books or papers, yet there is very much that can
and must be learned by reading. We all learn by picking up an idea here and a thought there. Then in the aggregate there is quite a good deal of practical value gathered together. It is much like the bee when getting the nectar which it transforms into honey—a drop here and a drop there of sweetened nectar, then to the hive it is "hollered down" into the honey that is so delicious. We must, after reading, "boll it down," by thought and meditation, to the consistency that shall make it usable and valuable. Thus will our reading, of whatever kind, prove to be helpful and profitable.

(Edited of 1899–1900.)

**No. 2—A Review of "A B C of Bee-Culture."**

By Prof. A. J. Cook.

(Continued from page 149.)

Page 147—It is stated that there are 53 different varieties of goldenrod. This is an incorrect use of the word variety. The goldenrods are species. The same as our bee—Apis mellifera. A variety or subspecies is one of the local races or races occurring in a single district. Thus the Italian bee is a variety or subspecies of Apis mellifera. In the figure on the same page, the three plants each represents a species.

Page 172—I am surprised at Mr. Root's style on this page. "Tarnal nuisance" and "pawed out" might do in Gleaming in Bee-Culture, possibly, but some one or other object to them in a book like "A B C of Bee-Culture." Still, this is a matter of taste, and I may be hypercritical.

Page 173—The typographical errors in this book are few, but the second one on this page I think a failure. I think the first one on the previous page gives a much clearer idea. This figure appears to me like a small cube inside a larger one. I should consider it a right-angled figure.

Page 177—A strange error occurs here, for which I fear my own poor chiropragraphy may be to blame. Mr. Root speaks of the coccids as scarab insects. This certainly should be scale insects. I have a dim recollection that in the last century, when this subject was written about, I, the settler made my scale a scarab. I fear that this is what misled Mr. Root. The statement is also made that these honey-dew-secreting insects—plant and scale lice—propagate in the topmost leaves of trees to build up honey-dew in referring to the first figure on this page. The letters should be reverst.

Page 174—The figures of the book are usually clear and admirable, but the second one on this page I think a failure. I think the first one on the previous page gives a much clearer idea. This figure appears to me like a small cube inside a larger one. I should consider it a right-angled figure.

Page 179—I am quoted on this page to the effect that much aphid honey-dew is deliciously wholesome, and the honey from it is a great delicacy. I thought it an absurd idea that "the ordinary stuff that we have in Ohio, and that which I have seen in other localities, is usually of a dark color and rank flavor, to me very sickening and unpleasant, and as Prof. Cook says, it should be sold to beekeepers elsewhere desiring an inferior or strong-flavored honey." The error. Mr. Root makes here is easily explained. I have no doubt but that the honey from Aphisides is almost always of pleasing flavor, and so always makes good honey. I have never seen a case in which the honey was not true. While in the Yosemite last summer, away upon one of the highest peaks (Cloud Rest) 10,000 feet above the level of the sea, we ran across plant-lice on the pine trees. There were bees in the region, and the honey-dew was present in great drops so that it was very easy to test it. All of our party pronounced it excellent. Perhaps I should say this was before they were told where it came from. This aphid honey-dew is common every year in nearly all sections of the country. Yet it is so unobjectionable that almost no one knows it. The bees take to it, and I doubt if they will often leave this even for the nectar of flowers. I have certainly known them to work the honeydew of the larch right at the trunk. Besides, who could resist the white clover bloom. Many of the bees were gathering from the clover, others were taking from the honey-dew. The mixture all sold readily as clover honey, and I am sure it sold as clover honey. The honey-dew on the other hand, is not so common, and is only present in certain years when the scale are very numerous. Another fortunate peculiarity is that it is dissolved into the honey, and thus yields a honey still more delicious. Likewise, the scale insects of the East prosper most in a succession of dry seasons, just at the time when the flowers do not furnish nectar. The honey from this source is dark and rank, and we have computed that 70 per cent of the honey made from this scale is honey-dew. I think our bee-keepers should all understand this distinction, and should become acquainted with the aphid honey-dew. It may be flavored. If so, it has not come under my observation.

Page 185—Two mistakes of faulty proof-reading are evident on this page. One of the beggar-ticks—Biedens frondosa, is referred to as Burr margold. This should be Burr frondosa. Likewise, the venus cardiosa should be motherwort instead of motherwork.

Page 193—Our author refers to the thorax of the bee as the shoulders. He shows the abdomen detachat, and states that it is detached from the shoulders. This use of the word thorax is evidently incorrect, and indicates that the thorax is a perfect good word, I see no need of coining a new one.

Page 204—The letter "O" is omitted as marking that division of the word. Uniformity would be better observed if the "O" were supplied.

Page 213—A case of misspelling is made very prominent on this page. I think it is always spelt jasmine or jasminum that has given rise to so many mistakes in other plant being poisonous. It would be so easy to make the mistake. We know that honey makes some people seriously ill whenever eaten. That it might occasionally make a person sick who usually was proof against the ill effects is easily to be believed. I can understand how Xenophon might have made a mistake. A lot of hungry soldiers eating freely of honey would in almost any case give employment to the doctor. We know that false-leaves are poisonous, the larvae of these bees have known cases where the larve of bees have been seriously poisoned by receiving honey poisoned with Paris-green which had been applied at time of bloom in the apple-orchard.

Page 214—In describing the way that bees get pollen, Mr. Root credits the tongue with an important part of the work. I have never noticed that the bee used its tongue to get the pollen. The antennae collector on the front leg gathers the pollen, not from the tongue but from the antenna. I hope others will observe and see whether Mr. Root is right in the explanation. My own observations would the rather teach that the compound hairs which clothe the body so generally, and the legs of the bees, are the instruments. Mr. Root has anything to do with it.

Page 222—Our author does well in using the development theory to account for the color of blossoms and birds. It is perhaps modest to say, "I can not positively affirm." I think, however, that no scientist to-day will deny the interrogation-point in using the evolution hypothesis to account for the color in flower, fruit or bird. To question it shows that the writer or speaker is not conversant with the latest in science. I am glad that Mr. Root has never been one to be afraid of truth.

Page 227—Is it wise to say that ten-day queens may be just as good as any? If I am right, experience, no less than theory, would tell us that ten-day queens would give us a good lesson in this matter. When things are normal they start the queen from the egg. I think the wise breeder will always do the same.

Page 230—It is very interesting if Mr. Root's views regarding the presence of eggs or larvae stimulating the
Adaptability of Bee-Keeping to Women.

By Mrs. L. C. Antle.

I am surprised that more women do not take up bee-keeping as a business, for I am sure they would find it profitable, conducive to health, and a pleasure, if followed perseveringly.

As bees never ought to be handled except in warm weather, in taking care of them there is no need of exposure in unsuitable weather, as is often necessary in other occupations. Women also would be greatly helped in their aches and ailments, especially if she has enough colonies to look after to keep her busy. When swarming begins and she has to see to it that the swarms are cared for if she is only half able to care for it, she will become more and more discouraged that before she is aware of it she will be on the fair road to recovery. She has been working out-of-doors, breathing the fresh air, been somewhat sunbaked, heard the birds sing, and forgotten home troubles. Some of our most successful apiarists are women. Most men bee-keepers have women helpers. Indeed, much of the work to be done with the bees seems just adapted to women, as they are more likely to look after the little things that are needed by them. When there is a brood of young ones or a heavy mortgage, the wife or grown-up daughter would engage in bee-keeping, she could do much toward lifting the heavy burden from the shoulders of the husband and father. Even if there are no debts to pay it is nice for a man to have a little money with which she feels satisfied herself, as there are so many ways in which she can use it—for benevolences and the like—and there is real joy in giving what one earns one’s self. Then, it is quite a help to have plenty of honey to sell. It doesn’t mean anything to most people, the unexpected company comes a section of nice honey or a dish of candied honey helps to fill up the table, and most people enjoy eating it.

I think one great reason why more women do not take up bee-keeping is that they are afraid of the stings. But if Italian bees are kept, and handled gently, working with them only when the weather is warm and sunny, always giving them a puff or two of smoke at the entrance before opening the hive, and getting the queen to move from one part of the hive to the other, the woman will feel satisfied herself, and ought never to be sold to beginners. Then the next thing she should have is a good text-book on bees—don’t buy an old one because it is cheap, but get one that is up with the times. Follow the book very closely the first few years, and pay little attention to what a neighbor advises unless you know him to be a practical apiarist. It is better to have few colonies at first, and I am not sure but that it is just as well to have five as to one. It seems to me to spend the time reading up for only one colony when one can just as well look after three or five.

Many women will say they have no time to spend in caring for bees, and yet they spend much time in working in the garden, and with flowers, or poultry, and none of these things pay as well for the time expended as do the bees. Better have a few colonies of bees, and a little less of something else—perhaps fewer ruffles and tucks on the children’s clothes, or make less pies and cakes.

In order to make bee-keeping easy and successful we must do everything at the right time, and have things in the right place. Bees will not put up with anything, and if we do not suit them they will not suit us. We must follow their instincts more or less, and help them in following them out to the best advantage.

If weak women would have the care of bees all to themselves, and be removed from all other work and care, very many of them would find their health. I know this from experience. Working with the bees has done me more good than hundreds of dollars spent for medicine could have done.

There is something very fascinating about bee-keeping. It is not necessary when you get your bees to care for them, to have their nectar made up, and made warm and dry and the rest on the summer stands. Simply remove all extra combs and surplus from the hives, and fill the empty space with dry chaff, first covering the combs the bees occupy with thick cotton cloth, to prevent the chaff from falling down among the bees.
**Large Brood-Chambers For Queen-Rearing.**

**BY G. M. DOOTILLET.**

A CORRESPONDENT writes thus: "Will you please tell us something new in large brood-chambers, in which the queen is placed, that we can see? I have used a large one-story hive holding 36 frames, running parallel with the entrance, so I can not very well use the plan given in the 'Bee Answer Book.' How do you proceed to rear queens in such a hive as the one spoken of above?"

The hive spoken of by the correspondent is very similar to the one which I used when the plan of rearing queens in large areas appeared in the Bee Journal. Some years before I had made four hives on the "long-ideal" plan, which was brought to public notice a score or more of years ago by D. L. Adair, of Kentucky. I had been using them for years for extracted honey, but laid aside, as I found it paid better to work my apiary more wholly for comb honey. Soon after this, D. A. Jones, of Canada, came out with a new plan for working for comb honey, in which he placed the queen in a box having six combs of brood in the center of a long hive and filled out the ends with sections, claiming that in this way large quantities of section honey could be produced without much swarming; and as these long-ideal hives would be just the thing to try the experiment with, it would cost me very little to see what there was in the plan. So I changed the combs and bees from my usual hives back into these hives again, put in two queen-excluders, and placed six combs in the middle of the hive, according to his plan, when the first thing which came to my notice in opening the hive a week later was sealed queen-cells wherever there was an unsailed brood left which the queen did not now have the means of reaching. To put it more clearly, I had no idea the bees would try to queen, but a time when work crowded so that the removing of these cells was neglected till they hatch, went out of the hive, were fertilized and commenced to lay, so that I had two laying queens and the rest of the fraction. But, I did not have a chance to try this experiment in producing honey on the Jones plan, as all probability "Scientific Queen-Rearing" would never have been written, for right here was where I got my first ideas of a system which finally developed into the method found in the book.

In carrying out the Jones plan wide frames of sections were put next the apartment containing the queen, and, every ten days or so, some of the combs that had been with the queen, and were now full of eggs and brood, were taken out and placed beyond the wide frames of sections toward the ends of the hive, and empty combs placed with the queen to take the place of those removed. In this way the queen is always in the center at the back of the hive, the bees kept from swarming, and the bees coact to work in the sections to the greatest advantage. And it was on these frames of brood, placed beyond these wide frames of sections, where these queens were reared as spoken of above.

It will be noticed that there were wide frames of section between the combs where these cells were reared and the queen-excluding division-board which kept the young queens in her place, and the wide frame was open on the other separators on them which tended to keep the young queens from going to the perforated zinc and quarella thru it with the old queen. As the plan of securing honey in this way was a failure in my hands, these hives were cast aside again, and the upper-story plan was adopted as given in my book. But I have found from long experience, that, where ever there is unsealed brood on which the bees cluster, but from which the queen is not doing much, you can put perforated zinc, enameled cloth with a hole or two in it, or a division-board with a crack in the same, the bees will generally build queen-cells on these combs, and if it is so that the young queen hatching from these cells can not "touch noses" with the old queen, and if there is a place of exit, as near the part of the hive in which this queen hatches, she will generally, in due time, become fertile, when a honey-flow is on, and go to laying, as she would if there were no other conditions.

Hence, to rear queens in such a hive as our correspondent uses, all we have to do is to fix the same so that two or three combs of brood can be put in one end of the hive, and better so four or five, and then place the laying queen, put two queen-excluding division-boards, these latter being half an inch apart, so that the queens can not touch each other. From past experience, my way of doing such hives would be to put the young queens at the rear end, and in many combs as I desired her to occupy, placing next to her apartment a queen-excluding division-board. I would now place two empty combs next to this division-board, and immediately in front of these but in another queen-excluder. I would now fill out the remaining space between the last excluder and the front end of the hive, or entrance, with combs of brood and honey, and rear queen-cells there, and have them fertilized from the same, as I gave in my plan above.

Now, while I have told what I would do when using such a hive as the correspondent says he is using, yet I do not feel like closing this article without saying that, in a place like central New York, I have used the one for the practical bee-keeper to use if he wishes to produce the most honey with the least capital and labor.

Ondaga Co., N. Y.

**No. 1.—Practical Lessons for Beginners in Bee-Culture.**

**BY REV. J. D. GEHRING.**

I was working in my apiary one beautiful May morning transferring brood-frames from one hive to another. It was what bee-keepers would call a typical bee-day. I had hived four swarms that morning, and the bees were fairly crazy in their eager rush and hum, gathering in the rich nectar which the blooming white clover was yielding in great abundance that season. I was stooping over an open hive, the act of pushing a frame of brood from one hive to another. You have heard my name spoken, and some one saying, "I would just like to know what you are doing with that hive of bees?"

Straightening myself up hastily, I saw directly in front of the hive at which I was working, and standing within a few inches of the open hive, a woman, with the most winning smile I ever saw, was looking at me, focusing her beautiful blue eyes on me. I was struck dumb by such beauty, standing in a patch of sun shining on the face, and just knowing that I had to do or say anything, darted down the open stairway of the cellar, and was out of sight in a twinking.

I closed my two open hives and followed him, directing my son, who just came home from school, to the house, to take care of Mr. Bond's team. I found the run out inside of the door of the cellar, puffing and blowing, and rubbing the end of his nose. Noticing his action, I knew where to look for the instrument of torture. Drawing him toward the open door, I said, "Good boy, I got a little stinging out by placing my thumb-nail under the poison-sac, instead of grabbing hold of it with thumb and finger, as bee-sting doctors usually do, and thus squeezing into the wound all the formic acid contained in the little sac attached to the sting."

"Never rub a bee-sting," I said to Mr. Bond, "until after you, or some one else, has performed the operation I have just shown you. Never. It's a lucky thing the little fairy didn't hit you in the eye. We can apply almost any kind of a remedy to the nose, but not to the eye."

"Ain't it queer, tho', how quick those pesky bees left me when I got in here," remarked Mr. Bond, as he gently rubbed the end of his nose. "What do you do for bee-stings?" he asked, as we ascended the cellar-stairs.

"I usually pay no attention to them," I replied, "because generally I am too busy to run away from my work and doctor bee-stings. I seldom get stings in the face, however, because I wear a bee-velv when I do work among the bees that is liable to put them on the defensive. They always flight in defense of their home and property, Mr. Bond, and seldom for any other reason. And there is no telling when bees will not sting when they are being disturbed, and they suspect that the disturber intends some sort of mischief to them. The practical reason, however, why I wear a bee-velv is, because they always aim for the eyes when they have a chance and the disposition to sting. And, as I always need my eyes, even more than my
hands, and nose, Mr. Bond, when I am busy with a hive of bees, I wear a veil to protect them. When a man tells me—even if he is an old bee-keeper—that he never wears a veil in his apiary work, and that he never gets stung, I am disposed to believe him. I have been talking thru his last year's hat.

"Now come with me to the entrance of the room in the honey-house that I called my workshop. "I always keep a bottle of alcohol for emergencies. A small sponge saturated with some of it and applied to your nose for about ten minutes will relieve the pain and reduce the swelling. I think this will do for the fainting fits in the stinger.

"Now, please tell me," said Mr. Bond, after several minutes silence, "why I got stung the minute I stepped in front of that hive you were working at, and you, with your hands and your nose right down among the bees, wasn't too bad?"

"That's easily explained, Mr. Bond," I replied. "I account for it this way: My bees know me. They are accustomed to my presence and to my manipulations. You, on the other hand, are a stranger. They know you as such by sight and smell. Then, to make bad worse, you plant your perspiring person directly in front of their only door, and so near that they can't help but regard you as an intruder. I know the way to them. I know that there's a number of bees on guard at the entrance of their hive, and these guards are very vigilant. No doubt they saw you at once, and one of them took aim at your face and struck your nose. A hot sting like that is never an accidental one. Some bees are never satisfied. It's a good body to tell me those bees that followed me to the cellar left me as soon as I got inside the door?"

"They left you because bees never go into a dark room if they can help it, except, perhaps, to steal honey—and because they were satisfied as soon as you were out of sight when you got there. And here let me mention the fact for your benefit, that a person who is being stung and followed by a lot of angry bees can do nothing that so promptly and completely do them as to run into a room. A room, of course, is best, but any room will do better than to run about outside vainly fighting them. They give up as soon as they find themselves prisoners—always and ever."

"That's a very interesting fact to know," remarked Mr. Bond; "but I don't quite understand what you mean by saying, 'my bees know me.' You don't mean by that that bees know sense, do you?"

"Yes, Mr. Bond, I certainly believe that bees have sense. But my belief is surely not orthodox, for, everybody—even the vast majority of bee-keepers—give bees credit for a high degree of instinct, and nothing more. But can you tell me what instinct really is? Can you define it? And what is the distinction between instinct and intuition? By intuition we know things as by instinct. That is, intuition is knowledge which is not acquired thru the reasoning process. No one can prove that bees can not and do not reason. I can mention several things that bees do that they couldn't and wouldn't do by instinct alone. Here, for instance, is a sample of their work"—taking a pound section of honey near me and giving it up before him as I spoke. "Examine it and see if it isn't perfect in every detail. See how white and even the comb is, and how beautifully it is fastened to the wood of the section all around. When they put that honey into those combs, they put honey, but not nectar, or syrup, but very little thicker than water. They converted it into honey, thick as the best sugar syrup, by evaporating it. And how, do you suppose, do they know that vaporization is necessary? And how do they know how much they should evaporate? I suppose, and they seem to know, too, that fanning the open cells of sweet water will thicken it to its proper consistency.

"Bees seem to have sense enough, too, to understand that this fanning work is best done during the night, when all the nectar gathered for the day is stored in the combs, when the hive needs extra ventilation on account of the heat caused by the bees being at home, and because it saves precious time. It's the bees that do the work of gathering the nectar that must also do the evaporating work. Drones will not do it, because it's work, I presume; and the baby bees in the hive can't do it before they have learned to fly.

"Now, Mr. Bond," I continued, "look at the surface of this comb. You see it is perfectly smooth and regular, and almost snow white. I have 1,600 like this stored in my honey-room just beyond the partition, all filled and sealed like this, since the first of this month, by 16 colonies. You see, they not only know how to work, but how to do the best kind of work. They make no mistakes, and they never seem to forget anything. One of the most curious things about this comb work is, that there is an air-space between the honey and the wax with which the surface of the comb is covered, or sealed. How they manage to produce this air-space, and how they know if it is necessary, are bee-secrets which have never been whispered into inquisitive ears. But bee-keepers do know that, but for this air-space, that beautiful white surface of the comb would be an imperfection, because without it the honey would come in contact with the wax, soon softening it, causing it to break up, and let the honey ooze out. You can see how important this little item becomes when you realize the fact that with this air-space omitted by the bees, shipping comb honey to the markets would be out of the question. We would be limited to extracted or liquid honey."

Before I could proceed to explain further, Mr. Bond suddenly jumped to his feet and looked anxiously out of the window that afforded a view of the apiary and the street beyond, saying that the movement meant, and could afford to smile as I said:

"You are anxious about your horses, Mr. Bond. Well, you needn't be. My boy put them into the stable and fed them soon after the fracas. If you go with me to the house, we will now have some dinner, and I will show you my wife and children. Then, if you care for another dose of bee-talk, I shall be glad to have you spend the afternoon in the shop with me. I have a lot of sections to put together and prepare with comb foundation, and I can talk while I work."

(To be continued.)

REV. J. D. GEHRING.

The subject of this sketch was born Dec. 15, 1837, at Buchberg, situated at the foot of an isolated haystack-shaped mountain bearing the same name. It is presumed that the mountain existed before the town, hence it is also presumable that the town was named for the mountain.

From the top of this mountain the snow-clad Alps could be seen. The famed "Rhinefall" at Schaffhausen, Switzerland, is within hearing distance of Buchberg.

His father, at the age of 60, emigrated to the United States in 1848, with wife and eleven children, and bought a small farm in Fulton County, Ohio. Mr. Gehring enlisted as a private in Co. C, 27th Wis. Vol. Infantry, served three years, and was mustered out as 1st Lieutenant, and as a cripple for life. Disability was caused, mainly, by a sharp-shooter's "minnie ball," which past thru the back of his neck, fractured vertebrae, and resulting in partial paralysis of the left side. Other serious results develop as time made history and old age.

He began keeping bees in Parkville, Mo., in 1884, started with two colonies, both presents from friends who did not know what to do with them, and were anxious to get them out of the way for fear of getting stung. Transferring these two colonies to "movable-frame hives," and handling over 300 pounds of white clover honey, in pound sections, the first season in the new home, and then every improvable mind to believe that he had now cease to be a keeper of bees, and had become a bee-keeper instead. Mr. Gehring keeps his front door latch-string always hanging outside for visiting "friends."

Thus a somewhat remarkable combination of circumstances he and Miss Anna J. Doty were brought together in 1866, and have continued the happy union as husband and wife into this the 20th century. Five children—four
daughters and a son—are in evidence to propagate the parental union of German and Scotch-Irish blood.

It may not be amiss to say for Mrs. G. that she loves bees—in the abstract sense—but bees never learned to love her—not, however, because she is not a lovely woman, but, rather, because her husband's bees never seemed disposed to let her get intimately acquainted with their way of doing things when they were out of humor. It was not owing to any fault in her character; nor could the fault have been owing to her Scottish descent, that Mrs. Gehring's earnest effort to become her husband's "helpmate" in bee-keeping was a failure from the start. It remained a puzzle in Mr. G.'s mind to this day why bees—well-trained and usually well-behaved like his were—should behave so badly toward a sweet, mild-dispositioned and loving little woman as ever blest the life of a bee-keeper. But these bees did treat her badly—on a certain special occasion—and the resulting coolness between her and the whole apiarian tribe will end only with life.

Referring to the Falls of the Rhine, in Switzerland, Mr. Gehring writes us as follows:

The Rhine is one of the most interesting rivers in the world. Its source is among the Alpine glaciers of Switzerland, and its waters enter the sea thru the lowlands of Holland. On its banks is every variety of scenery, towering mountains, wild and picturesque rocks, dense forests and fertile plains. It flows between flourishing villages and populous cities, castles and ruins with which a thousand legends are connected. Along its course for many centuries great historical events have been taking place: the victories and defeats of the Romans, the heroic deeds of the age of chivalry, the coronation of kings, the meetings of ecclesiastical councils, and the wars of modern times. We can not wonder that such a river is regarded with little less than reverence, and that great numbers of tourists come from all parts of the world to look upon it.

The upper Rhine is especially remarkable for beautiful scenery. The Falls of the Rhine near Schaffhausen form one of the finest cascades in Europe. The breadth of the river above the falls is 126 yds., and the height of the unbroken fall is about 60 ft. The rapids above and below are taken into consideration, the total fall is nearly 100 ft. Not far above the falls is a bridge known as the "Rhinelfall Bruecke." (Bridge of the Rhinefall). High above the river on a wooden rock stands the Schloss Lauten (castle of the rapids). From a garden of this picturesquely situated edifice the best view of the falls may be obtained. One gallery projecting over the roaring, seething cataract.

In the year 1845, when eight years of age, my Aunt Ann, a sister of my mother took me on a visit to my grandparents, who resided about nine miles northeast from the falls, and about 18 miles from my home on the banks of the Rhine below the falls. On the way we past thru Schaffhausen, and stood together, hand-in-hand (I being afraid to stand alone) upon the bank of the river viewing the awakening scene. The spot where we stood was a little way below the cataract, not far from the old mill seen upon the left bank in the picture. The railroad bridge above the falls was not there then. There was no railroad in all Switzerland before 1850.

--John D. Gehring.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for $1.60. It would be a nice picture to frame. We have not counted them, but think here are nearly 200 bee-keepers shown.

Questions and Answers.

CONDUCTED BY
DR. C. C. MILLER, MARENGO, ILL.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Drones and Swarming.

1. If I destroy all the drones from a colony that wants to swarm, will this prevent swarming?

2. When a swarm leaves a hive, and I have the Allee queen and drone trap on, are you sure the swarm will return to the hive?

ANSWERS—1. No; but it is thought there is less likelihood of swarming if drones and drone-brood are kept down. But it can by no means be counted on as a sure prevention of swarming.

2. You have only one colony, you may count to a dead certainty that in the case you mention the swarm will return to the hive. If you have any more cases, you may ask that the swarm will not go off, and under ordinary circumstances it will go back to the hive from which it issued. But if it should happen that a little while before another swarm had issued and returned to its hive, the bees still making a loud call at the entrance of the hive, your returning swarm might return to this latter hive instead of returning to its own.

Tail vs. Square Sections, Etc.

1. I began bee-keeping last year and now have 36 colonies. My troubles are caused by the great variety of bee-supplies. I have 60 supers meant for 4½ x 4½ bee-way sections. Now I want tall sections with no bee-way. I think of buying 60 supers designated "L." These take 4 x 5 sections. Now, can I alter the old supers so they will carry 4 x 5 sections? I'm afraid robber-bees will get in.

2. Will filling all cracks with white lead injure bees in any way?

3. I think of using full sheets of light brood foundation in all frames when hiving swarms, these sheets to be wired. Is this a good plan?

4. Do you prefer tall sections with no bee-way to the old-style square ones with bee-way?

5. Are the combs less liable to be built together and do the bees enter them as readily tho they sit across the frames?

COLOMBIA.

ANSWERS—1. There are so many different surplus arrangements that take 4½ sections that it is impossible to tell how much change would be required; but by the exercise of a little ingenuity almost any of them could be changed to take 4 x 5 sections.

2. It will do no harm.

3. An excellent plan.

4. It is largely a question of one's market. Some prefer one and some the other.

5. You will probably find no difference.

Bees Diseased and Dying—Closed-End Frames.

1. I took 12 strong colonies of bees on shares last spring. One or two swarmed and almost all stored a little surplus. When I prepared them for winter—that is, took off the supers—they had plenty of honey and appeared to be strong, and along about January 1st, I examined and found all dead but three. On examining the combs of the dead ones I found fully 1½ of the cells with cap brood, with a small puncture in the cap, and an offensive smell, not like a glue-pot. I took five back to the owner last summer that were both weak to defend themselves, and I didn't want any robbing. The owner (a bee man of 20 years' experience, so he says) claimed it was caused by moths. The bees I have here haven't any moths in the hives; besides, I haven't any trouble with the moth, anyway.

2. If it is foul or pickled brood, why do they die in winter without any brood, and be stronger in bees than some of my weak ones?

3. What course should I take to prevent it from spread-
ing to my own bees? I fear they got some of their honey. The diseased colonies have been destroyed by fire and water, and every caution preserved all summer, or while I have been suspicious.

4. There is nothing like a bee-keeper who made hives of his own invention, and bought several for almost nothing. Knowing nothing about the hive, I would like to be enlightened. I enclose a pen outline of it. There being no space at the ends of the hive, will the bees work well on Langstroth frames? It is what I would call a closed-end frame.

INDIANA.

ANSWERS.—1. I don’t know what the trouble is, but it can not be charged to the moth.
2. Whatever disease of the brood, or whether any, there seems to have been some wintering trouble that would produce such loss.
3. Keep everything as snug and clean as you can, taking special precaution to prevent all robbing of infected or suspected colonies by allowing no cracks or too large entrances to invite robber-bees. Be sure that none of the suspected colonies are weak. If they are, unite them. There will be no real loss in this, even if nothing is wrong with them. Carefully study all you can find that will inform as to the brood diseases of bees, including what has been said in back numbers of this journal and Dr. Howard’s brochure on foul brood. A thorough knowledge of the whole subject will enable you to judge more intelligently what is to be done than can any one at all.

Basswood for Brood-Frames—White Clover—Honey in Candies.

Wisconsin.

ANSWERS.—1. Basswood is not too short-lived for brood-frames, but entirely too lively. You probably know that it is unusually bad to swell and shrink, and it twists out of shape altogether too much for anything that needs to be as exact and permanent as a brood-frame.
2. There is the common white, and the white Dutch. The former is a large kind, and sown on rich soil it grows quite large. But so will the common, and I feel sure the two are one and the same thing.
3. Probably not. It would be very much better for the public if some of the glucose in candies were replaced by honey.

Bees Dying—What is the Cause?

Of 76 colonies that were in fine condition about Dec. 1st, there remain alive at present 30 colonies, and I expect some or all to die soon if nothing can be done for them. They all had plenty of honey so that was not the cause, or at least the quantity. The bees could not fly one day for nine weeks. Of those that are dead, part of the bees are on the frames in a mass, and part in some lower corner; and all, alive or dead, have the inner part of those hives, including frames and bees, perfectly wet and soiled; also it smells very strong. All are on the summer stands. Some were in single-wall hives, some in chaff hives, some had chaff cushions over the frames, and some had none, but all are affected alike. There was hardly any honey for the bees to gather last fall, and they work freely on half-rotten and bruised apples in orchards; but some received their entire supply of winter food by feeding granulated sugar as late as Sept. 20th.

May it have been caused by doses of poison not sufficiently strong to kill them while gathering it? It is very probable that they received some. What shall I do for them?

West VIRGINIA.

ANSWER.—This is one of the times when it is painful to say I don’t know, and yet I am obliged to say it. Working on rotten apples in orchards could hardly do so much mischief, unless there were cider-mills from which they obtained large supplies. It will hardly do to lay the trouble to the general stores, for some had their entire supply of granulated sugar. The guess that there was poison in the case seems a reasonable one, but if it were poison would it not have killed the bees sooner? The thought comes that the entrances may have been closed so tight that there was something like suffocation in the case, but a man with 78 colonies has in all probability had too much experience to make a mistake. I was no doubtaggerated by the confinement of 9 weeks.

It is nearly certain that in your latitude bees are now flying, and there will be some good done by cleaning up all the hives and getting out the dead bees. If the trouble continues after the bees have had a good try at least a few by taking away their stores and giving them sugar syrup. It is to be hoped that a good flight will do much good.

Sugar-Candy for Winter-Feeding of Bees.

In the "A B C of Bee-Culture" (1891 edition, I think), there are directions for making hard candy for feeding bees, by boiling sugar with a little water. I believe Mr. E. T. Abbott has also frequently recommended such candy. I wish you would tell me thru the American Bee Journal if you have ever tried such candy, and with what results. I considered the above authority so good that I recommended it in a couple of instances before trying it myself. I also risk a few colonies to work on something that happened to discover in the nick of time that it doesn’t seem to do for this "locality." In short, one colony was dead—clustered right up against the candy and it was about half dead, that is, a large portion were just able to hang to the comb—then it all gave out to crawl around. The other colonies had a little honey yet and were all right. I hastened to give them combs containing some honey. The candy had been on only a week or two, and the colonies were in good condition when it was given. They are packed with leaves on the summer stands, and there has been no cold weather to speak of—a very mild winter here. They gnaw thru the candy and it falls on the bottom-boards as if granulated honey looks when the bees have such in their combs to use. I am sure the candy is not burned, in fact it looks just as Mr. Root says it should—"dry and hard as slabs of marble"—and about as valuable, according to my experience. What say you were wrong?

IOWA.

ANSWER—I have never had occasion to feed candy, but would have said with no little confidence that you would have no trouble whatever. I must confess that your experience staggles me, and I don’t know enough to account for it. I suppose that tons of candy have been fed, and I do not remember to have read a single report like yours. Of course it looks somewhat as if there had been so much stirring that it was stirred down to sugar, but that could hardly be the case if it stuck together as candy. If any of the good friends can throw any light on the case, it will be a great favor. Has any one else had a similar experience?

Convention Proceedings.

BY WM. G. VOORHEES.

The Michigan State Bee-Keepers’ Association held its annual meeting at Traverse City, Mich., Dec. 26 and 27, 1908. The meeting was called to order by the president, and Mr. J. Root officiated.

The president made a few remarks referring to present needs, and the purposes and educational work of the Association.

GETTING BEES TO WORK IN THE SUMMER.

A. S. Jackson—How can we get bees to work in the summer?

Mrs. George Jackson—Smoke them up into the sections when the brood-combs are filled with brood, and they will work there if you put on some unsealed sections.

W. Z. Hutchinson—Put on unsealed sections.
George Hilton—When using deep frames, and the bees do not enter the sections readily, take out the side frames that are filled with honey, and extract it; then return the empty frames to put them in the center of the brood-chamber. When the bees will not work in the supers it is sometimes because there is too much honey in the brood-chamber, and this choked condition is often caused by honey being carried over from the previous season. We have to put supers on early in northern Michigan.

Mr. Hutchinson—To get the bees to work in the supers, half or partly filled sections are sometimes used. Get the bees to clean out these unfinished sections the fall before, and in the spring they can be used. Sometimes the outside frames in the brood-chamber are filled with honey. These can be uncapped and placed in the center of the brood-chamber, when the bees will carry this honey up into the sections.

Mr. Beecham—You can not always get the bees to work in sections or starters.

Mrs. Hutchinson—I use drawn combs to get them started.

W. J. C. Davis—I have had no trouble with bees not working in the sections.

Mrs. Jackson—I have had no trouble with bees loaﬁng. I tier up the supers with partly ﬁlled sections.

POLLEN IN THE SECTIONS—CROSS BEES.

Mr. Beecham—I produce extracted honey altogether. I have had trouble with the Hedion hive, as I have to use a queen-excluder. When I produced comb honey and had to use a queen-excluder the bees put pollen in the sections, and the queen sometimes got thru the excluder and laid eggs in the sections.

Mr. Hutchinson—I have no trouble with pollen in the sections, and would suggest that Mr. Beecham put a comb in the brood-chamber from which the honey has been extracted, and this comb would work pollen. I think that being bothered with pollen in the sections in this way was a good deal of a matter of locality.

Mrs. Menold—When the frames are ﬁlled with honey I take out one of them and put a new one in its place.

Mrs. Menold—What shall I do with cross bees?

Mr. Beecham—Change your queens.

WINTERING BEES—PUTTING ON SUPERS.

Mrs. Menold—I do not winter my bees in the cellar. I put a dry-goods box over the hive and pack hay between the box and the hive.

Mr. Beecham—I have had trouble with bees storing honey on frosty nights. I would like to ask Mrs. Jackson if she winters her bees in the cellar.

Mrs. Jackson—Yes, I do not put them out until the willows bloom, and I put on sections in apple-bloom.

Mr. Beecham—I think that bees should be protected on cold nights in the spring. For the past two years I have wintered mine in this way, and think that when they are so protected they will succeed in the spring.

Mr. Coveyou—I think that the supers should be double-walled and tight. I should also want double-walled hives.

Mr. Root—I think that bees in chaff hives will not be affected by cold nights. If the bees are to work in the sections at night the supers must be warm enough for them to do so.

Mr. Berg—I lose more bees in the cellar than in chaff hives, so I prefer to winter them in chaff hives.

Mr. Hilton—I have cushions on all of my hives. I think the cushions must be retained on the supers in order to have the bees draw out the comb. The supers must be tight or the bees do not work in them, and it will not do to put on supers when the brood-chamber is only half full of brood. The brood-chamber must be ﬁlled with brood and no honey, and the hives must be warm.

Mr. Beecham—I was led to use the Hedion hive so as to avoid the handling of so many frames. I would like to ask if Mr. Hilton has any trouble in getting out the ﬁrst frame.

Mr. Hilton—None at all. I have self-spacing frames with thick top-bars.

Mr. Sillsby—I have no trouble in getting out the ﬁrst frame. I use a block with a slope to it, and laths and top-bars. Neither am I annoyed with brace-combs.

Mr. Hilton—I leave a 3⁄4-inch space between the top-bars to prevent brace-combs.

Mr. Beecham—There must be a good judge to know when is the right time to put on supers.

Mr. Townsend—I use full sheets of foundation.

Mr. Root—One must have the hives tight so that the cold air cannot enter them.

Mr. Beecham—I have had trouble with bees that would not store honey in sections, but would store it in the extracting combs.

Mr. Townsend—They will store honey in the extracting combs, rather than in the sections.

Mr. Hilton—I have had experience with both starters and full sheets of foundation, and the sections have been ﬁnished sooner when the full sheets were used.

PLAIN SECTIONS AND FENCES.

Mr. Coveyou—I like the fence separators best, as the queen does not like them.

Mr. Root—Three-fourths of the orders now are for plain sections with fence separators.

Mrs. Menold—I use a section plain all around.

Mr. Hilton—A plain section is one without the inset. I never have a first-class section of honey until I used plain sections. The sections must be taken off as soon as they are caped over or they will be travel-stained. The tiering-up must not be continued too long. The plain section without the inset has come to stay. The honey that sells to fancy trade is that secured by using plain sections and fence separators.

Mr. Berg—I used plain sections for the ﬁrst time the past season, and like them the best.

Mr. Fox—I have sold my honey in plain sections in this city.

USING OLD SECTIONS—ALSIKE CLOVER.

Mr. Root—Does it pay to use sections that have been used the year before?

Mr. Hutchinson—I think that if the old sections have been taken care of and kept clean they are all right to use again.

Mr. Hilton—I have put on sections that have been used before, but every year I use less of them. No sections ever come off as nicely as the ﬁrst I put on—the ﬁrst honey here is the best. I get better results when I use new sections, as the bees seem to work better in them.

Mr. Beecham—I have always used drawn comb in the sections. I take off sections before the buckwheat ﬂow, as I do not want it to get mixt with the white honey.

Mr. Berg—I have used cleaned sections with drawn comb, and have found that the bees would get these combs uneven. I get the best honey from new sections, when I use full sheets of foundation.

Mr. Sillsby—I sold all of my white honey for 15 and 16 cents per pound. There are 100 acres of aliske clover near me, and the bees work better on it than on red clover.

Mr. Storer—I had a ﬁne lot of honey from aliske clover; bees like it the best.

EARLY FEEDING—WORKING IN SUPERS.

Mr. Sillsby—I would like to ask about early feeding to build up the colony.

Mr. Hilton—Begin to feed as soon as the bees begin to ﬂy.

Mr. Hutchinson—I do not think that liquid feeding in the spring pays. A weak colony must not be stimulated in the spring; if this is done and a cold spell comes on then it’s “good-by” to the colony.

Mr. Berg—I have had trouble with bees not working in the supers. I reduced the swarming fever by extracting—putting on a shallow super, then extracting the honey they stored in it, and afterward putting on sections. I put a new super underneath the one partly ﬁlled, being careful not to allow the upper one to become ﬁlled.

Mr. Hilton—I put an empty super underneath the one partly ﬁlled, and tier up just as soon as the super is 3⁄4 full. Bees will not work by an empty super.

Mr. Coveyou—I think it pays to put supers on early, so as to get the early ﬂow.

SWARMING.

Mr. Berg—When bees have nothing to do they want to swarm. I would rear colonies from queens that do not swarm, as my experience has been that I get more honey from bees that do not swarm.

Mr. Beecham—If you run for extracted honey your bees will not swarm, but they will if you run for comb honey.

Mr. Berg—I had one colony that did not swarm, and they stored from three to four suppers of honey every year.

Mr. Sillsby—I have had no trouble with the bees swarming, as I run for extracted honey.

Mr. Kitson—I have had three queens in one hive, each queen having a part of the hive.

Mr. Beecham—It is very difﬁcult to keep the bees from swarming when producing comb honey. People should not eat comb honey, as the wax is not good to eat; it is indigestible, and is not made to eat, but to hold honey. Extracted honey is the best to eat.

Mr. Hutchinson—Extracted honey is more easily pro-
duced, and the outlook is good for it at present. The market is growing better all the time, and no bee-keeper who has kept a large number of colonies has made money unless he has run his bees for extracted honey.

Mr. Beecham—I would like to ask if the Hilton hive would stay pack!

Mr. Hilton—They are ready for use all the time—winter spring or fall.

KEEPING ANTS OUT OF HIVES.

Mr. Beecham—I am bothered with ants.

Mr. Berg—I used tarred paper under the bottom of the hives to keep the ants out. I like the chalk hives the best, and ventilate them in warm weather, when the bees hang out.

Mr. Root—I use tar paper to keep the ants out of the hives.

Mr. Hilton—I use salt to keep the ants away. It will drive the ants away, but not the bees. I put the salt on the inside of the hives, on the bottom-board.

Mr. Root—Some people like to know of something that will keep the grass and weeds down.

Answer—Salt will do this very well.

BEES AND FRUIT.

Mr. Root—What about that case near South Haven, Mich., where a peach-grower sued a bee-keeper for damages?

Mr. Rankin—The bee-keeper was sued by a peach-grower for damages to the amount of $200. The records of the Department of Agriculture at Washington, D. C., showed that bees will not attack fruit with a whole skin. From the evidence shown at the trial the fruit-grower withdrew his suit. It seems that some of the early peaches were affected with a peculiar this causes attack the fruit before it was ripe, and the bees work on this fruit.

Mr. Root—The same trouble occurred in the State of New York with the early cling-stone peaches. A suit came to trial there but the verdict was “no cause for action.”

Mr. Beecham—I have noticed this in this part of the country. The fruit-growers want the bees near their fruit to fertilize the blossoms. Many of them spray their fruit-trees while in bloom, and some bee-keepers have lost half of their bees from this cause.

Mr. Hilton—A law past while I was in the Legislature prohibiting fruit-growers from spraying trees while in bloom.

Mr. Kitson—I wish that law might be published in the bee-papers.

(Concluded next week.)

The Home Circle.

Conducted by Prof. A. J. Cook, Claremont, Calif.

KINDNESS IN THE HOME.

I never could quite understand the biblical expression, “The wind doth destroy the vines.” The fox has no love for the vineyard. The poultry-hose attracts him far more. Neither vineyard nor grape is toothsome to Reynard, yet the truth taught in this small fox, and despised vine-field, is absolute. The true home is built on real heart-sympathy. Unless each feels for the other, what will keep back the cruel sarcasm, the unfeeling word, the taunting laugh? And are not these, one and all, the little foxes?

I have a dear home in—father, mother, two daughters. It is a home where the bitter word, or thought that prompts it, was never in evidence. Paul’s grand words were ever heeded in that splendid home—“Let each esteem the other better than himself.” I mind me of a beautiful winter evening. I was the fifth one in that home circle for the time.

We were all talking in merry mood, except Edith, who was trying to manage a great volume of pictures. Her small lap and the big book were a great misfit. The not impatient, she turned the pages with no slight effort and trouble. With any break in our converse, the thoughtful father past thru the large wide-open folding doors to the next room, quietly reached a suitable chair, and soon the myriad pictures were resting on this improvised book-stand, where it was easy to turn the great pages. It must have been a rich reward to that thoughtful father’s heart, as his act was greeted with a sweet smile and hearty “Thank you.” This was just one of a whole troop of kindly acts that so filled that home with sun-
Maule's (35 new things for 1901) Seed Catalogue

You should, by all means, have this modern catalogue of modern times. It is replete with and overflowing with good things in vegetable, flower and forage seeds, bulbous plants, fruits, bulbs, etc. It contains 35 novelty crops, many of which have never been offered before, has 159 pages of illustrations and hundreds of diagrams. It gives practical, up-to-date cultural directions and offers many new prices. The first edition alone costs over $0,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which may deduct from your first order. You will make a mistake if you do not order for this rare and valuable Novely Seed Book of the year. Address, W. S. HENRY MAULE, Philadelphia.

Bee-Supplies

GREAT home-grown and common stock

Having a job Lot of a neighbor and added to what I had, I must dispose of some to make room for my increased stock. They are mostly in May, June, July, August and September. Please mention Bee Journal when writing.

Belgian Hares

CHEAP! PEDIGREE, AND COMMON STOCK

Having a good Lot of a neighbor and added to what I had, I must dispose of some to make room for my increased stock. They are mostly in May, June, July, August and September. Please mention Bee Journal when writing.

Italian Queens

of last season's rearing, ready as soon as the weather is warm enough to send thru the mail. Write for prices. Address, J. L. STROEGER, Clarinda, Page Co., Iowa.

Please mention Bee Journal when writing.

Lonestar QUEENS

Breeder of FINE ITALIAN QUEENS

G. F. Davidson & Sons, Established 1855. FAIRVIEW, Wilson Co., TEXAS. DAIRY. Please mention the Bee Journal.

Winter Report—Long-Tongued Bees.

The season of 1900 was not a very good one for honey in this locality. I had a paying crop for three years, but look for better things the coming season. The indications for a good crop of white clover were good up to March 30, but it turned cold on the 4th, after having been warm for a few days, and melted all the snow, which leaves the clover in bad condition. Bees wintered outdoors have had a number of good flights during the winter, but the chances are the bees are not doing very well, being more uneasy than usual; more than a third of the 20 colonies in the Illegal are spotting their hive, and I think there are many more dead bees on the floor than in former winters. I have been keeping the records of the bee stock since Jan. 10, and also of the number of hives spotted, and will report on it later.

I have several of the long-tongued bees, 18 and 19 mm., the latter of the five-banded stock. I shall watch the tongue matter next summer, as I am preparing to measure the tongues. Theo S. BURLE, Tama Co., Iowa, March 3.

Bees Wintering Well.

Bees are wintering well, being build up nicely for next year, and, prospectively, had a honey crop; but sometimes we have dry weather that cooks us out. T. B. BOWDINS, Milan Co., Texas, Feb. 4.

Hard Winter on Bees in New York State.

So far the 20th Century has been the worst ever known for bees in this locality. There has been no winter where it was not a flight, and during the whole month of February it didn't thaw even in the shade, with the thermometer from zero to 30 degrees below the average of the month. The snow is from 4 to 10 feet deep in our roads, and the ice is from 18 to 22 inches thick on the ponds and lakes. Bees that survive will be of a hardy race—those wintering on the summer stands, at least. O nôngada Co., N. Y. March 6.

Report for the Past Three Seasons.

I am a man with a hard case of chronic bee-fever. Two years ago a friend gave me, late in July, a colony of bees in a box hive. They cast a swarm the next day, which I hired successfully in a Langstroth hive. Late as it was, it had not been accounted for; the weather being very cold and the next summer I divided them. The colony in the box-hive swarmed when I was doing another thing and came back to the box and never more. I got 125 pounds of comb honey that year.

The next spring I purchased 20 colonies at $3.00 each; that was poor fruit for honey in this locality, and I got 420 pounds of honey that year. I added 20 more and increased to 22 colonies. One of these was queenless in the spring, so I began the last season with 21 colonies which gave 1,250 pounds, which was a good yield, but there was no fall flow to speak of. I secured 73 pounds per colony.

Dittmer's Foundation!

Retail—Wholesale—Jobbing.

I use a process that produces every essential need of the beekeeper, and is most desirable in all respects. My process and all others need improvement on their own inventions, which enable me to sell foundation and work wax into foundation for cash at prices that are the lowest. Catalog giving full line of supplies, with prices and samples, free on application. Beeswax wanted.

A 20th Century Catalog—It is not the fault of the seedsmen if the tables of the farmers at this season of the year are not adorned with colored illustrations of the products of the vegetable and flower gardens. While the seed catalogs and most attractive is "Maule's Seed Catalog, 1901," Its 136 pages are bristling with information about seeds that grow, which Maule sells. From it we learn that the concern is one of the largest and most progressive in the world, paying out during the last 5 years, for postage, $15,000. There are several valuable novelties in the catalog, the two leading ones being the "Success" tomato, which has been pronounced by the best tomato introduced to the American farmer and gardener, and the "Hard Core," a large, hard seed, to be the greatest milling corn in the world. Other new varieties are: Maule's Whinstone, the Model mangel, the Nameless cabbage, a new, unamed French Carrot, Imperial, Giant sugar-cane, Maule's trimmed lettuce, Excelsior Tree egg-plants, the Prodigal pea, and others. In the last catalog I have been unable to remember to have seen any one catalog. It would be an educator in any family, and be had free by our subscribers for the asking; others must send 10 cents for it. Published by H. Haas, Philadelphia, Pa., and mentioned American Bee Journal when writing.

Bee Wintering Nicely.

My bees have wintered nicely, and the prospect are better for a good crop of honey this season.

Wm. M. McNeal

Seloto Co., Ohio, March 19.

Prospects Bright—Controlling Swarming.

The rain is pouring down and the country in this vicinity never looked better. All the farmers are rejoicing over the prospects of a splendid season, and all is fine for the beekeeper as well as the farmer.

The last of next month I expect to requeen all of my colonies, and try to control swarming, if possible. Last year we had but 11 swarms, and I notice that one of my colonies has swarmed again this year. I have been moving all my colonies, so that no swarms issued from the prime swarm. A little while before swarming-time I requeen all colonies, giving them a young laying queen, so I am not very often troubled with swarms; but sometimes they will swarm in spite of all that I can do to prevent it.

San Joaquin Co., Calif., Feb. 23.

M. H. Voight

1900 a Poor Season.

Last season was a very poor one for bees here. There was not much for them to gather after July 1st, so a great many of them went into winter quarters with very little to live on thru the winter, and now I hear that over 60 percent are dead. Mine have not quite so far, I fed them last fall, and expect to feed again in the spring.

Bee Wintering Nicely—Good Report.

My 19 colonies of bees seem to be very quiet, and I think they are wintering nicely in the cellar. The bottom-boards are nailed tight to the bottoms of the hives, the entrances are open clear across, and the covers are shoved forward about two inches, with a cloth over

PAN AMERICAN EXPOSITION.

Nothing since the World's Fair, at Chicago, in 1893, has elicited the widespread interest that is manifest, all over the world, in the World's Fiscal Exposition, which is to be held in Buffalo, from May 1 to Nov. 1, 1901.

The purpose of the Exposition is to illustrate the progress of the nations of the Western Hemisphere during a century of wonderful achievements, and to bring together into closer relation the people composing the many States, Territories and Countries of the three Americas. Acting under proper authority, the President of the United States has invited all the Republics and Colonies of the American Hemisphere to join in commemorating the close of the Nineteenth and beginning of the Twentieth Century, by holding this International Exposition on the Niagara Frontier.

For this important event, the Nickel Plate Road has issued an attractive, descriptive folder—pamphlet, elaborately illustrated, the Pan-American Exposition, the buildings and grounds.

The Nickel Plate Road is the short line between Chicago and Buffalo, and affords competent train service from Chicago to Buffalo, New York, Boston, and all points East, with trains of modern equipment, on which no extra fares are charged; also dining-cars service the highest order. It affords meals in its dining-cars on the individual club plan, ranging in price from 35 cents to $1.00.

Call on any agent for Pan-American folder, or address John Y. Calahan, General Agent, 111 Adams St., Chicago.

Parties desiring hotel or rooming accommodations in Buffalo or Niagara Falls, during any part of the Pan-American Exposition, are invited to apply by letter or otherwise to F. J. Moore, General Agent, 291 Main St., Buffalo.

Please mention Bee Journal when writing.
The New RUMELY Thresher
will save enough extra grain in threshing to pay the taxes of the ordinary farm.

The extra cost of a round ball of clover...the old-fashioned "(1) Pencil, (2) Ruler, (3) Compass, (4) Pencil, (5) Ruler..."

Bumble-Bees in Winter—Prospects Good.
For a number of years it has been, and still is, a mystery how bumble-bees get safely thru the winter. If one will tell me how they get there I will tell where to find them. During the winter months a Bumble Bee Round Ball can be found underground, on the inside of which is a white, downy bumble-bee, apparently about ready to emerge. About the third of old gooseberry blooms the occupant comes forth and partakes of Nature's best. This round ball, so far as I can tell, is precisely the same as those formed by the tumble-bug.

Bee-Keeping Experiences.
About six years ago I bought two colonies of blacks, paying $5 each for them in July, and from one of these I obtained a super of nice honey that season. After wintering them in the cellar, from whence they came in August, I put them away in a drawer, and I also put one of the two colonies into winter quarters.

A HANDY TOOL-HOLDER!

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, who makes any one using a grindstone...should have one of these Tool-Holders. Every boy can do the work of two persons, and grind much faster, easier, and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

How to Use the Holder.

Directions.—The Tool is fastened securely in the Holder by a set-screw and can be turned to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steadies the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as it is held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

GEORGE W. YORK & CO., 114 & 116 Erie St., Chicago, Ill.
CONVENTION NOTICES.

Chicago.—The next regular meeting of the American Bee-Keepers’ Association will be held Thursday, December 23, 1897, in the Briggs Hotel, Chicago, from 1 p.m. until some present get tired and quit, which is usually 9:30 p.m. A feature of the meeting will be the sale of bees for present use to $50 in a company. All are urged to be present and aid in making the meeting a great fashionable time.
Herman F. Moore, Sec.

Rocky Mountain Bee-Plant Seed!
(From British Columbia).

The ABC of Bee-Culture says of it: “This is a genuine and true description of this genus, and nothing of the honey it produces. It grows from two to three feet high, and has large, bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, and is said to furnish large quantities of honey.”

We have a few pounds of this Creme seed, and are willing to sell it at a very low price. We have been a pleasure to receive communications from any of our members, who have joined our bee societies, and we strongly recommend the members to use this seed. Address, Pres. E. S. Loving, Salt Lake City, Utah, or J. B. Fagg, Sec. East Mille Creek, Utah.

HONEY AND BEESWAX.

MARCH 28, 1901.

American Bee Journal.

Chicago, March 28.—The choice grades of honey and beeswax are now on the market and mostly equal to the demand; all other grades are also much in evidence. The increase in price of pure grades is as follows: Fair grades of white, 140/150 cts.; best grades of white, 150/160 cts.; best grades of amber, 160/180 cts.; buckwheat, 75/90 cts.; dark honey, 50/60 cts.; buckwheat, 55/65 cts.; and all the extra grades are governed by the same law in the range of prices, the lowest figures in either of these grades applied to the sweet, or off-flavored, and variegated. Beekeepers will do well to remember this.
R. A. Burnett & Co.

NEW YORK, March 19.—Our market is very brisk, and we are receiving orders from all parts of the country for a large supply of beeswax and honey. We are also in receipt of the latest reports from beekeepers in various parts of the country, and are prepared to furnish the best information on the subject of beekeeping. We are now in receipt of reports from beekeepers in various parts of the country, and are prepared to furnish the best information on the subject of beekeeping. We are now in receipt of reports from beekeepers in various parts of the country, and are prepared to furnish the best information on the subject of beekeeping.

LAUNCHING A MILLION IN GOLD

From Alaska during the year 1900.

For millions of this came from the Nome district. Government officials estimate the output from the Nome district will be doubled the coming season. The Bluestone, Kougarok and Pilgrim rivers have been found very rich, and here is hardly a creek from Port Clarence to Norton Sound in which the precious metal is not found, and hundreds of creeks will be worked this summer. A rich strike has been made on the Yellow river, a tributary of the Kuskokwim.

For full information regarding routes, steamship accommodations, and rates will all correspond address Souther, General Agent. Passenger Department. C. M. & St. P. R'y, 95 Adams Street, Chicago.

The Danzenbaker Hive.

This hive is rapidly gaining favor, especially in the Eastern States, where tall sections and closed-end frames are used to a considerable extent; and within the last year or so the Danzenbaker system has been working its way into California, Oregon, and even into Cuba. At the Paris Exposition the hive was awarded a gold medal, and at some of the honey exhibits in this country the comb honey from it has carried off the first prize. Some of the finest honey we have ever seen was produced in Danzenbaker sections; and in the opinion of others who have given the hive and system an extended trial, there is nothing to equal it for the production of a fine article of comb honey. Indeed, in some markets comb honey in Danz. sections commands one and sometimes two cents more per pound than other fine honey.

Mr. Danzenbaker has long been an advocate of warm supers and warm hives; for he has always insisted that, for the production of comb honey, the super and hive must be warm in order to do the best work in wax building. To a very great extent the Danzenbaker hive is double-walled; and the sections in the super are especially protected by a special paraffine mat which goes with every hive.

The brood-chamber itself has the same dimensions as the regular 10-frame Dover-tailed Langstroth hive, except that it is shallower: that is, it takes 10 closed-end brood-frames 7½ inches deep and 17 inches long. Each brood-frame is supported by a pivot in the center of the end-bars, so that it may be readily reversed. These brood-frames retain all the advantages of frames peculiar to this class; viz., being reversible, they insure the building of combs to the bottom-bar; as there is no opportunities for air-currents around the ends of the frames, combs, as a rule, are built clear out to the end-bars. This one feature makes them warmer for winter. When a division-board is used on each side we have, practically, a dead-air space around the ends and sides of the brood-nest. The Danz. brood-nest has the same capacity as the 8-frame Dow hive—a capacity that has generally been recognized as the best for the production of comb honey.

But Mr. Danzenbaker has gone farther by making his brood-nest shallower and wider—increasing the amount of surface for the super, and bringing the brood itself—a feature which many consider important—closer to the surplus. The Danzenbaker brood-chamber can be used with any of our 10-frame supers, either comb or extracted; with any of the 10-frame covers, bottoms, or hive-stands, or with the 10-frame Jumbo hive. There are four patents on the Danz. hive and frames.

NOTICE.—The Danzenbaker hive is not made in the 8-frame widths.

THE A. I. ROOT CO., Medina, Ohio.

GEORGE W. YORK & CO., 144 & 146 Erie Street, are headquarters for Root's Bee-Keepers' Supplies in Chicago.

Send to them for their free Catalog.
Did you hear the robin piping,
   Calling for his mate?
He has just returned from Southland—
   But, perhaps, she's late.
He tells us the plum-trees will soon be in white
To witness his vows and the bird marriage-rite.

Did you see the prairie crocus
   Held in childish fist
Tight as lover holds his sweetheart
   At the evening tryst?
This brave little flower opens early to fling
Its largess of gold on the honey-bee's wing.

Maples blush with ruddy blossoms
   E'er the frost is gone;
And the showy golden willow
   Brightens on the lawn.
The barn-fowls are noisy, proclaiming each day
The debt which they owe and are trying to pay.

Interspersed with cheery sunshine
   Weeping clouds appear,
But, together, they encourage
   Life with hope and cheer.
"The winter is past," every sleeping bud cries,
And seeds burst their caskets, determined to rise.
Long-Tongued Bees
ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2); or, one Tested Queen FREE as a Premium for sending us FOUR new subscribers (with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder will use is direct from Italy, having imported him herself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring vein or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clip, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash
paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow, upon its receipt, or 30 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey
ALL IN 60-POUND TIN CANS.

ALFALFA HONEY........

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who eats that honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY........

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

A sample of either, by mail, 8 cents; samples of both, 15 cents to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9½ cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are box.

Order the Above Honey and then Sell It.

We would suggest that those beekeepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.
Granulated Sugar and Glucose.—Mr. Thos. Wm. Cowan, editor of the British Bee Journal, but now residing in California, sent us the following communication early in January, but owing to our "deluge," and also moving to our new location, it was overlooked until a week or two ago:

Editor AMERICAN BEE JOURNAL:—On page 810 of the American Bee Journal for 1900, alluding to granulated sugar, Mr. E. E. Hasty endeavors to explain what he thinks I mean when I say "much of the granulated sugar of commerce is adulterated with glucose." Also as a rule I do not notice criticisms, recognizing the right of everyone to his opinions, and do not care to be drawn into any controversy respecting such criticisms, yet in this case, having a pleasant recollection of a personal visit to and talk with Mr. Hasty, I think it is due in courtesy to him to explain that I meant exactly what I said, because glucose is found in commerce, at home and abroad.

On page 750 (1900) it will be found that, in explaining how glucose was made, I said, "The solutions are evaporated to a syrup consistency and sent into the market under the names of granulated, corn syrup, or to dryness, the solid product being known in commerce as grape-sugar." It is this dry glucose or grape-sugar that is used to adulterate granulated sugar, "the very dry white sugar" which Mr. Hasty alludes to. It is difficult to detect the adulteration by simply looking at the sugar. Raw or brown sugar is similarly adulterated.

The presence of glucose when mixed with raw or refined sugars may be generally known by paying attention to the following points:

1. Sugars mixt with powdered or granulated corn glucose, on solution in water invariably leave white particles of glucose undissolved.

2. On submitting a commercial sugar containing glucose to the polariscopic test, it will be shown that the reading does not remain constant, but gradually becomes less until a point is reached when the diminution ceases altogether. If the solution is observed immediately after preparation as little as three to five per cent glucose may thus be detected.

There are other methods of analysis, but they are only suited to the chemist's laboratory, and would not interest your readers. I can assure Mr. Hasty that it is not at all uncommon to find both raw sugar and refined dry granulated sugar adulterated with glucose.

With respect to pollen in honey, I can only say that in the large number of samples that I have examined, more or less pollen was found in every instance, and the presence of pollen-grains has frequently assisted me to determine with accuracy the source of the product.

If, and when, I have the time and inclination I should like to criticise Prof. Cook's criticisms of my book, "The Honey-Bee," but although I have a personal regard for him, I do not find pollinisation adduced anything which would cause me to alter any of my views expressed in that book.

Yours truly,

Thos. Wm. Cowan.

To Drive Ants from the Lawn.—Fine coal ashes sprinkled about the burrows of ants will cause them to leave. Ashes may be used on the lawn without injury to the grass. Sifted ashes are best, but those fresh from the stove, shaken from the stove-shovel, will answer the purpose very well.—April Ladies' Home Journal.
to pay his taxes all the same. If his bees are to be exempt because in some years they make no return, then his swine should be forever exempt because some years the cholera strikes them.

Those who believe with Mr. Tracy probably reason something like this: "There are years in which my bees not only pay me no profit, but are an actual expense, so that I would be better off at the end of the year if I had no bees. Manifestly I should not pay taxes on a thing of no value, and as the failure may occur any year, the easy way out of the difficulty is to have the bees exempt from taxation every year."

This has a somewhat reasonable look on the face of it, but one may imagine an assessor replying something like this: "Everything is assessed according to its valuation, not according to its profitability to the owner."

"But," says the bee-keeper, "this year if the bees yield no harvest they are of no value, and should not be taxed."

"At what price do you sell colonies of bees in years of failure?"

"Why, just about the same as other years."

"Then they have a marketable value, and rightly, because even although they may yield no return you do not give them away for nothing, holding them of value because of the possibility of what they may do in the future. And you seem to lose sight of the fact that you already have reduced taxes because of the uncertain character of your bees. If you could count on getting each year straight along more than $100 from each colony, as you did one year, then bees would readily sell for a much higher price than now—perhaps three times as much—and your tax on them would be three times as much. But the very fact that bees are uncertain property brings down their value, and so their price. If you insist that no tax should be paid in a year of failure, then in a good year when the profit on a colony of bees is as much as the profit on a cow, you ought to be willing to pay cow-tax on bees. When you are really giving away bees for nothing, it will be time for you to say they have no value."

Mr. Tracy closes by saying, "I believe that all property should be taxed. But I do not believe from my experience that it would be right or just to call bees taxable property." Which is equivalent to saying that bees are not property, or else there is a direct contradiction.

A New Honey-Eater.—Mr. Walter R. Ansell, of Ramsey Co., Minn., has sent us a sketch of a little animal which has been recently discovered in western Australia. It has been named Tarsipes Rostratus, and, though only as large as a common field-mouse, belongs, like the kangaroo, to the Marsupial order—animals that carry their young in a pouch. It enjoys the unique distinction among mammalia of obtaining its living exclusively by robbing flowers of their nectar with its long, thread-like tongue.

We have reproduced our new honey-loving friend for the benefit of our readers.

"The Best Article" that was ever publish in the Review it would be difficult to point out. I doubt, however, if very many better ones have been publish than the one by S. D. Chapman, that appears in this issue. It is somewhat lengthy, but not more so than is warranted by the magnitude of the subject. There is more in that article than appears on the surface. The exact methods described may not be suited to many readers, but the thoroughness with which the writer has studied the conditions of his locality, and devised a system of management adapted to those conditions, furnishes an encouraging example for us to follow."

This is what Editor Hutchinson says of the article by Mr. S. D. Chapman on page 215 of this number of the Bee Journal.

---

The Weekly Budget.

To our Delinquent Subscribers.—We often wish we could sit down in the homes of all our subscribers who are in arrears on their subscription to the Bee Journal, and try to explain to them that in all fairness to us and to themselves they ought to do their best to pay at least all arrearages, and if possible a year in advance. It should be remembered that our expenses in connection with issuing this journal are regular, and must be met. We cannot put off our paper house, our printer, or our employees, with promises—they all must have their money. Hence, it is absolutely necessary that we should have the cash due on subscriptions in order to meet the necessary and constant expenses from week to week.

After we have favored several thousand subscribers by sending to them the Bee Journal for over two to four years without receiving any remittance, or any acknowledgement of our requests to them to pay their subscriptions, we feel that we are justified should we decide to take some other means in order to hear from them. While we would like to have every bee-keeper read the American Bee Journal regularly, we would not willingly and knowingly continue to send it to any one who does not want it. But we must insist that all arrearages, if any, be paid. We shouldn't think that any one would wish to discontinue a paper of any kind without being clear on the publisher's boon.

So many of us are careless about these matters. Of course, no one really intends never to pay his subscription. But do you know that when several thousand subscribers owe for say an average of three years at only one dollar, it amounts to a very large sum? And is it right that the publisher, who has faithfully furnish the paper right along, should be compelled to go without that much needed and very large sum, which belongs to him, and which could just as well as not be paid? For it means only a few dollars to each one who owes, but in the aggregate, to the publisher, it means the difference between a small profit and a big loss!

Reader, are you in arrears on your subscription to the American Bee Journal, or to any other paper that you are reading? If so, will you not do the proper thing, and "pay that thou owest"?

---

The Hunt for Errors in magazines, or in any publication, for that matter, is an interesting and profitable investment of time. Every article that is publish in the Ladies' Home Journal, for instance, is read at least four times in manuscript form, and all statements of fact verified before it goes to the printer. Then it is read and revised by the proof-readers; goes back to the author for his revision; is re-read by the editors three or more times, at different stages; and then, by the proof-readers possibly half a dozen times additional. Thus, each article is read at least 15 and often 20 times after leaving the author's hands until it reaches the public eye. But with all this unremitting vigilance, errors of the most obvious kind occasionally escape observation until perhaps the final reading, but it is rare, indeed, that an inaccuracy hides itself in the pages securely enough to go them that magazine's edition.

The improvement in the proof-reading of most of the bee-papers is encouraging. Yet there is still room for the exercise of more care along this line in nearly all the periodicals devoted to bee-keeping, the old American Bee Journal included.

---

The Rocky Mountain Bee Journal is the name of the latest claimant to the patronage of the bee-keeping public. It purports to be published "For Colorado and the Great Inter-Mountain Region." It is to be issued monthly, is neatly printed, and presents a good general appearance.

BY WM. O. VOORHEES.

Continued from page 203.

BEE-PARALYSIS—SPRING DWINDLING.

Mr. Berg—What are the symptoms of bee-paralysis and what is the remedy? Can it be cured without changing the queen?

Mr. Root—There are different kinds of bee-paralysis, or it acts differently in different locations.

Mr. Berg—The bees look shy, and seem to be shaking or trembling.

Mr. Root—in the South the disease is worse than in the North. When the queen is taken away they do better.

Mr. Kitson—I think my bees had that disease early in the spring.

Mr. Hilton—It is the result of inflammation. Mr. Chapman—I have not been bothered with it in my apiary.

Mr. Root—The bees that are not affected will put the sick ones out of the hive.

Mr. Rankin—I have had no experience with this disease. I have tried to put it up around the experimental wood queens and combs sent from the South, but did not succeed. I do not think that bee-paralysis will do much harm for far north.

Mr. Hutchinson—Nothing has been said about it for the last two years.

Mr. Kitson—I know what spring dwindling is; I lost one colony by it.

Mr. Kaufman—I lost a dozen colonies in that way. I cured them by changing them around, putting them in the place of healthy colonies.

Mr. Kirkpatrick—I do not think that the young bees have it; only the old ones are affected.

Mr. Root—When the bees begin to store new honey the disease disappears.

FOUL BROOD.

Mr. Hilton—I have a letter from C. A. Huff about getting a law past against foul brood.

George Jaquays—I got colonies with foul brood from East Jordan; it destroyed every colony I had but one.

Mr. Kirkpatrick—Four years ago in the spring I shipped 125 colonies from Indiana. I also took 67 colonies from a bee-keeper in this State to keep on shares. These last had been wintered in pits; I took them home, and afterward found that 37 of them had foul brood. I went all over the neighborhood but could not use any of the foul brood anywhere except in my apiary, and I burned all colonies thus affected. The next year I bought more colonies, but found that they also had foul brood, and I destroyed them. I lost 220 colonies all together.

Mr. Rankin—I do not think it necessary to destroy the colonies by burning them. The disease can be cured, but we must be protected from the bee-keepers who are careless to regard it. I think a law should be passed similar to the one in effect in Wisconsin. They have the disease under control in that State, and I think that when colonies are affected with foul brood and ordered destroyed by the foul-brood inspector, the bee-keeper should be compensated, as live stock is compensated for. We ought to have a State inspector. When I find a colony affected with foul brood I mark the hive with a capfull of iodine, and put a ripe hex around the letter. Iodine and the letter can cure the disease. Iodine and the letter can cure the disease. Iodine can cure the disease.

Mr. Kaufman—I tried to find a remedy for this, and I have found that Iodine—per cent. of iodine, per cent. of water, and per cent. of water—will cure this disease. Iodine and the letter can cure the disease. Iodine and the letter can cure the disease. Iodine and the letter can cure the disease.

Mr. Hilton—I have found it works very well, but we must be sure to use it in the right strength.

Chapman—I have had experience with both single-wafer and foul-brood. Ib.—Mr. Hilton—Have you used it in the open air?

Mr. Kirkpatrick—I have had experience with spring work, and have not lost many colonies from foul brood. My honey is from raspberry, clover, and basswood. I kill all queens at the beginning of the basswood flow, as I want young bees for wintering.

Mr. Hilton—Mr. Chapman must be very familiar with his honey-flow.

Mr. Chapman—I put all my light colonies in a row, and see that they have honey enough to last them until the honey-flow commences. I have very little swarming, and produce only extracted honey.

Mr. Berg—I should prefer to have the bees strong before fruit-bloom.

Mr. Hilton—I could not follow Mr. Chapman's plans for comb honey. One must know his location and know how to work his colonies. Mr. Chapman has two seasons for brood-rearing—one early in the spring and one in the fall. Those reared in the fall are the ones to be put into winter quarters. Bees can not winter on unripe honey, and every bee-keeper must know his location to a square mile. What method would do for one locality would not do for another.

Mr. Berg—I would like to ask if Mr. Chapman has good queens.

Mr. Chapman—I find I have better queens than I can buy. Mr. Root—Mr. Chapman could not rear new races of bees in this way, nor those extra-long-tongued queens.

Mr. Chapman—My bees are all Italians.

Mr. Hutchinson—I see no difference between rearing your queens and swarming. By his method Mr. Chapman makes up any loss.

Mr. Chapman—I keep watch of the drones and have only selected ones with which to breed, and permit only two colonies to rear drones.

BUILDING UP WEAK COLONIES.

Question—How can a weak colony be built up in the fall?

Mr. Hilton—We can build up a weak colony.

Mr. Berg—I made a weak colony with one that has a good queen, and sometimes unite three in this way.

Mr. Kirkpatrick—All colonies should be strong when put into winter quarters.
Mrs. Jackson—Could a weak colony be kept thru the winter by feeding a cake of sugar?

Mr. Hilton—The matter of increase can be overcome. You must have the best conditions in order to get the best results. Colonies must be strong in the fall if you want them strong in the spring. Bees can be fed during the winter in the cellar, with sugar-syrup, but you must be careful not to burn it when making it, and the best sugar must be used.

FOUL BROOD—CROSS-FERTILIZATION OF FRUITS.

Mr. Hastings, the representative from this district, had been requested to attend this meeting, and he made his appearance at this time. Mr. Rankin explained to him the effects of foul brood and States were doing to stamp out this contagious disease. Mr. Voorhies was called upon to explain what the effect would be on the fruit-growing interests of the State if the bees were destroyed by foul brood.

Mr. Voorhies—I am a pioneer in this part of the State. We first here had no honey-bees, nor even bumble-bees, here, and we could not raise melons, pumpkins, nor squashes without hand fertilization. I do not think all the fruit-growers realize the importance of cross-fertilization. I am more interested in fruit growing than in bee-keeping. I keep the bees on the fruit trees in the fall, and whenever we have a few bumble-bees in this locality, but no honey-bees. I am convinced from the experience I have had that the reason why we did not get more and better fruit was because the work of the honey-bees on the flowering was lacking. Fruit-growers nowadays do not plant Bartlett pears or Baldwin apples in large blocks, put in alternate rows with other varieties, and this is for the purpose of cross-fertilization. But we can not always depend upon this to get the best and not always good. There is nothing that I have found in my experience that effects cross-fertilization so perfectly as the honey-bee. In the growing of small fruits we have had the same experience. We plant pittillate, staminee, or perfect-flowers of extra-strawberry plants, in alternate rows, for this very purpose. Cross-fertilization will give the best results, and if we want No. 1 or fancy fruits, we must have it. The blossoms of small fruits do not usually keep open as long as the blossoms of apple trees may. The bees may not get along without the bees; one can not realize how important they are in this matter, unless he has had some experience.

Mr. Hastings—I will do what I can for the interest of my constituents while at Lansing. I have no doubt that the interest of fruit-growers as well as the interests of bee-keepers will be looked after. You have my best wishes for both of them.

It was moved and carried that the committee draft a bill similar to the one they have in Wisconsin, and present it to the legislature.

It was also moved and carried that the next annual meeting be held at Petoskey, the time of the meeting to be decided by the executive committee.

The Association then proceeded to the election of officers for the ensuing year, which resulted as follows: President, George H. Hilton; vice-president, Elias Covey; secretary, Wm. G. Voorhies; treasurer, W. Z. Hutchinson. Mr. Covey then desired queen-rearing as carried on by W. H. Pringle, of North Carolina.

QUESTION-BOX.

Question—Does it pay to paint the bottom-boards?  Mr. Hilton—It pays to paint both sides of the bottom-boards.

Mr. Kitzon—What kind of stands are best for hives?

Mr. Hilton—I would have 2 1/2 scantlings in clay, and have the bee-board 3/4 of an inch thick.

Question—Which way should the hives face?

Mr. Hilton—I want my hives to face the east.

Mr. Hutchinson—I have tried all ways, and do not think it matters any which way.

Question—Should hives be shaded in summer?

Mr. Hilton—Hives do not need shade except in the hottest weather—July and August. The shade-boards should project over the sides of the hives to shade it properly, and weights should be used to keep them from blowing off. Hives should not be shaded in the spring, as the sun is best then to warm the hives.

Question—What size of hives is best?

Mr. Hilton—The majority prefer the 8-frame Langstroth. Comb honey can be produced with an 8-frame hive, but the 8 frames should be full of brood. To do this the honey at the side of the brood chamber should be extracted, and the empty frames put into the hive. I can do much more with the right kind of knife. The handle-part of the fork is usually made of metal. [See Fig. IV.]

To uncrap honey for the bees I, like Dr. Miller and others, have used an uncapping-comb or harrow. This implement was originally devised by E. Huber, of Baden, Germany, in 1884, as shown in Figs. II. and III. The times

Instruments Used for Uncapping Honey.

By Friedemann Greiner.

The first new thing in the line of apiarian implements coming to us in this new century will be an uncapping-machine—at least so it is hinted at. And, indeed, if a machine can be constructed to accomplish the work of uncapping for the extractor satisfactorily and speedily, we will have made a great step in advance, and all extracted-honey men will be quick, I think, to avail themselves of this invention. How great this step in advance is, will be apparent when I show the readers what the implements are like that have been used for the purpose in the past.

Nothing better seems to have been found by the American bee-keepers than the honey-knife. [Fig. I.] Regard-
and teeth of the harrow are crook at the ends and filed sharp; with them the cappings are sort of raked off, but can not be removed so perfectly but what a liberal portion of them will find their way into the honey and will have to be strained out or skimmed off.

I have no doubt that Dr. Miller's uncapping-comb varies somewhat in its construction from this one as well as mine; but we do not use ours to uncap for the extractor.

Another very old uncapping instrument is the spiked uncapping-roller. It works easily and rapidly, and it suits me to a dot. Of course it only mashes or destroys the cap-

[Fig. V.], with suitable small pieces of wood riveted on to make the handle complete.

Another uncapping instrument I see described as the uncapping-roller but neither the illustration nor descrip-
tion is an sufficient to give a clear idea of it, and as I do not find it spoken of in the bee-periodicals I judge that it is not a complete success.

The bee-keeping world is now awaiting with anxiety the forthcoming of Arthur Miller's uncapping machine.

Working According to Locality—Killing the Queens Each Summer.

BY S. D. CHAPMAN.

SITUATED as we are, just half way between the equator and north pole, we have here in the northern part of the lower peninsula of Michigan long, cold winters, and usually it is very early in spring before we have a chance to work. We have deep snow, yet the ground never freezes in the woods, and very little in the fields. The snow comes early in the fall, and it is nearly the last of April before it disappears in the forests. Several seasons my bees have gathered their first pollen from elm and soft-maple while there was yet a foot of old snow in the woods. A mile and a half east of us we are nearly on the high of the land, and two miles west we are nearly on a level with the lakes.

In the winter it is from seven to ten degrees colder on the higher ground. Near the lakes we will find, usually, about one foot of snow; ten miles due east of there we will find four feet on the level. Raspberry and basswood come in bloom one week earlier on the low land. That part of the Grand Traverse region bordering on the lake and bays is not as frosty as southern Michigan or northern Indiana; but, just in my bee-range, we have early frosts, and the nights become cool early in the season. For this reason I believe in putting my bees in winter quarters quite early in the season—about October 15th. Years ago I found that my bees, if left on the summer-stands during our cold and frosty nights, would consume more honey from October 15th to the middle of November, than they would if put in the cellar October 15th and left till April 25th. I find from 8 to 9 pounds of honey will carry a colony of bees 190 days in my cellar. In the last 15 years, 180 days is the least time that my bees have been confined in the cellar—211 days the longest time.

At the present time I am using the ninth bee-cellar since starting with bees in this vicinity, I do not know as it is necessary for me to tell it, but I will say that in some of these cellars about eight large hives will occupy the cellar. This cellar that I now use is under my kitchen. It is 16x24, and there about 200 colonies in it. Some seasons there are a few more; in others, less. It is perfectly dry—so dry that you can not, at any time during the winter, find a drop of moisture the least bit of a pinhead on the under side of the cover that is right over the cluster of bees. I use no quilts nor cushions at any time of the year; and I prefer this kind of a cellar. I can not winter bees in a cold, damp cellar; but in a warm, dry cellar they come thru seemingly in fair condition. They consume rather more honey, however, and they have not the vitality a colony has wintered in a warm and perfectly dry cellar. If I could hold the temperature of my cellar to the latter part of spring to about 45 degrees, I have no reason to doubt that my bees would be in good condition, and not show a sign of disease at the end of eight months of con-

I use the eight-frame Langstroth hive. I have had some experience with very large hives, but in our cool cli-

te we can not build up a colony in a large hive so that it can take advantage of the flow from raspberry. With us it is necessary that our bees are confined in as small a space as possible, with plenty of stores, and just room enough for their present needs. This applies from the time of taking the bees out of the cellar, till the time sugar-maps and fruit-trees come into bloom. From the 10th of May, we usually get our first honey from this source. In this vicinity there are a number of quite large bee-keepers, and every one of them has come to the eight-frame hive. We all work for extracted honey. With my system of management, the eight-frame hive is large enough for the needs of any colony of bees I ever saw. And I know my colonies are as populous as it is possible to get with any style or size of hive.

I pay very little attention to my bees early in the
spring. As I take them from the cellar, any colonies that seem light in stores are put in a row by themselves, and fed; but I do not break the sealed covers on the others till needed. Since colonies of bees are the very ones I am trying to build up very light colonies in the spring is thrown away. If they make a live of it they can be handled to advantage later in the season. With us, the time of the year when they are strong in the colonies, is during the month of August.

At the beginning of fruit-bloom I examine all of my colonies. From all that need more room, those that have been in the building way and as many spaces well-filled with bees. I take one frame from each in the brood-nest, selecting the one containing the oldest brood. I shake the bees off in front of the hive, and put a frame containing all worker-comb in the middle of the brood-nest in place of the frame with the brood. I then put on queen-excluding honey-boards, and leave them on till the close of the season. The reason I take this frame of brood from the brood-nest is that I find the queens will lay much faster in the middle of the brood-nest than they will in the outside combs. This being the case, right in the middle of the brood-nest is where we want our queens to do their work. We are after all the young bees we can get.

Now I will tell you why an eight-frame hive is far the best in building up colonies early in the spring. It is far better to have the brood in six or seven frames in the eight-frame than to have the same amount in four frames in a large hive.

The frame of brood that I remove, is put in an extracting-super directly over the brood-nest, and the super filled on each side with empty combs. The bees go right to work. If it is true that little honey is coming in, I can, in four or five days, take from this same colony another frame of brood. If it is a strong colony I take two. They are put in the extracting-super directly. I sometimes think our best bee-keepers do not know just what a queen is able to do, provided the conditions of her colony are just right—and we keep them so for 30 days.

In a short time I take more brood from the brood-nest. This time I put it in another super and set it under the one, or over the brood-nest. At this time I destroy the queen-cells that have been started in the first upper story. This will not work if a dozen queens hatch in the upper story. I sometimes think of getting out one or two combs, as I need, that were beside the first frame of brood put in the super, and as the bees have cleaned these combs and put a little new honey in them, they are just right to put in the brood-nest in place of the brood removed. The queen is not wanted in the comb at this time. We are too little careful not to take too much brood early in the season from the brood-nest, or we may discourage the queen. While our object is to stimulate the queen to lay her fullest capacity, I sometimes think our best bee-keepers do not expect to find not less than 13, and in some of my best colonies as many as 25, frames containing brood and honey there is more or less brood in all of them. I think my colonies are much better than they would have been if I had given the queen the two upper stories and let them build up without any of my assistance.

I follow this system of management just as long as the bees will be worth anything to me on the raspberry or basswood. We must recollect that there is a certain time during the life of a colony, each season, when we can build it up faster than at any other time during that season. We expect to find not less than 13, and in some of my best colonies as many as 25, frames containing brood and honey there is more or less brood in all of them. I think my colonies are much better than they would have been if I had given the queen the two upper stories and let them build up without any of my assistance.

Two years ago I set apart five colonies that were better than the average of the yard, and I gave the queen of each of these stories, and let them build up just as suited their notion; they were framed with honey as they needed. With the remainder of the yard (77 colonies) I used my method of management. At the end of the season I had 1900 pounds of honey, extra, to my credit from the spring, and I sold this honey at 65c on cent boards. I tried this experiment in an out-yard, three miles from home. It took one-half day to go to this yard, put brood in the upper stories, and go back to the spring. I repeated this eight times, requiring four days of time, and I had this 1900 pounds of honey to pay me for my four days' labor. The showing in favor of the 77 colonies had been much better if there had not been a number that did not amount to much on the raspberry. This is not all; my bees never think of swarming. I am complete master of the situation, under any and all conditions. This was the case of last season.

During the last three years, raspberry has yielded about the same each season. My best colonies, those occupying four stories, have yielded, each season, from 100 pounds to 200 pounds. We have found that three-story hives, during this same time have averaged 90 pounds each; my two-story hives from 20 to 40 pounds.

The wild red raspberry comes into bloom not far from the 5th of June, and it yields continually till near the 1st of October. A colony of bees in the past season it came into bloom the second time, and my bees gathered fully five pounds per colony from the 1st to the 10th of October. This is nothing unusual, tho' I do not recollect getting any other colonies to do it since this source. After my bees were in the cellar there was bloom, green and ripe berries, up to November 1st.

Basswood comes in bloom about the 15th of July; but we have had little honey from this source the last four years. When basswood comes in bloom in the year the colonies that wintered the best, that built up early in the season and gave us such large yields from the raspberry, that prove to be the best on the basswood. Far from it. There is no colony of bees built up rapidly in the spring, that is impossible to keep colonies laying honey, except for a short time. The honey may be coming in every day, the bees are getting old, and those colonies are on the decline, while colonies that were lighter early in the spring having built up such a brood on the raspberry, they bloom they are liable to send out a larger working force of bees that are just the right age to take advantage of the yield from basswood; that is why our lighter colonies prove the best on the basswood.

Remember, the faster the colony builds up, the more vigorous are the bees; so that the colony is able to bring into action the largest possible force of bees that are just the right age to take advantage of the flow.

From about the 1st to the 10th of July I kill all of my queens. I have practiced this for 16 or 17 years. I would not go to this expense unless I thought I had some pretty good reasons for doing it, as it takes a day in each yard to hunt them up. Where queens are work as I work them, they never prove not as good the second year. With my management the average life of the best of queens is not over two years. The first year of their lives, not one queen in a hundred is superseded. The second year, from 30 to 50 per cent. of them will be superseded. We do not have a season, just at the time we want a good queen in every colony. This makes a big hole in my honey crop. But at the time I kill my queens my colonies are in the very best condition. I am sure of just as good queens as we can get when we need them. I want to keep the colonies of bees hiving the queens, for about 25 days, no eggs are laid in the hives. Our colonies are not rearing a lot of bees that would be consumers for this length of time. As the brood and the honey are the things we want, we can keep the bees filled with these combs of honey, leaving the colony in better condition for winter. One of my best reasons for killing the queens is that thereby each colony is furnished with a good young queen to keep them up for the winter.

Experience and a careful study of this matter will show many more reasons why it is profitable to kill the queens each year in northern Michigan. As I said in the beginning of this article, the time to build up colonies so they are strong in the spring is during this month of March. I use the same method in the fall that I do in the spring, but not on so large a scale. Near the first of June I select from four to six of my best colonies, and in each colony I introduce a queen, one or two at a time. I do not intend to rear any drones except from these colonies, as I use only worker-comb in the brood-nests, and if a few drones are hatched they are quickly killed by hyperactive bees. Some may make the killer of the queens, for about 25 days, no eggs are laid in the hives. Our colonies are not hiving the queens, for about 25 days, no eggs are laid in the hives.
about as soon as they will one. In 30 minutes these section-cases are filled with bees; and they go right to work. I take more section honey, late as it is in the season, than could be crammed into the other colonies so they gave me from the beginning of the honey harvest; and I have already taken 60 or 80 pounds of extracted honey before I put on the section-cases. They do the work so quickly that we get an extra grade of honey.

I have told you that my bees do not swarm, and I think I can tell you why they do not swarm. The raising of the brood to the upper stories, distributing it in three or four places, and there is no larger the brood which is not to be put in the same frame-cells in the upper stories. I should have had over 80 queenless colonies had not I discovered it just in time to take cells from those colonies that were rearing queens.

I mention this case to show the conditions into which we can bring our colonies; and how slow they are sometimes even to recognize the loss of their queens. I think these are the reasons why my bees do not swarm up to the time that the young queens hatch; and I think the management and care in keeping them from swarming at the time the queens hatch. My bees do not get the swarming-fever. When the young queens hatch, the conditions in the hive are changed; I have put nothing in the upper stories for a week or more previous to killing the queens. If there is a colony in the yard that has the swarming-fever at the time I killed the queen, I will have it swarmed in time to the 13th day, even tho I have not had my queen-cell that whole week, while the others do not have a queen till the 14th or 15th of the month because of the time of destroying the queens.

At the time the queens hatch there is no brood in the upper stories, and I extract the honey closely, so, at this time the queen may come. My bees do not swarm at the time the queens hatch. I have run my out-yard of 90 colonies the whole season, killed all the queens, and have had but one swarm; and that swarmed at the beginning of fruit-bloom before I had put on any upper stories. The swarming-fever is a spontaneous impulse, and we can so change the conditions of a colony that it is liable to contract the desire to swarm in 15 minutes. Supposing, at the time the young queens hatch, that some one has them, and that not all of them have destroyed the queen-cells, now remove all the upper stories, confining these large colonies to the brood-nest, and I should expect every one of them to swarm. I would have my hands full for a day or two. With the conditions I have known a colony to swarm 30 minutes after we had brushed the bees carefully from the combs. If we shake the bees from the combs we cover them with honey, and have spoiled the experiment.

Just before the queen hatch I make my increase by division; and it is not at the expense of my honey crop. In union there is strength. I have kept the bees in each colony together till near the end of the honey harvest. Many of our best writers have frequently told us always to keep our colonies strong. I hardly think this is good advice for our locality. Years ago I would have given a good deal if they had given a little farther and told us just how small the colonies must be, or left an argument to show how strong. And now, just for the fun of it, I would like to know, when their colonies are strong how they always keep them so.

It is necessary that every bee-keeper should understand his own locality, and what is best adapted to the requirements of his location.

I have not written this as a pattern for bee-keepers in New York, or California, or any other State, but simply at the request of a few bee-keepers I have written it in order to show what I have been accustomed to do in using the American Bee Journal—both for $1.10. Antrim Co., Mich.
Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Muncie, Ind.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Enron.)

BROOD DISEASES.

A subscriber sends me a sample of brood that may be affected by foul brood or something closely allied to it. In matters of so much importance it is wise to take no chances and to waste no time; so I advise anyone who has reason to think that anything like foul brood, pickled brood, or black brood, is present in any of his colonies, to send a sample with the regular fee of $2.00 to Dr. W. M. Howard, Fort Worth, Texas, so that it may be analyzed, and then the sender will know positively what is the trouble, and what is to be done with it. I know of no one in this line more competent than Dr. Howard, and bee-keepers owe him a debt of gratitude for his investigations.

C. C. MILLER.

Transferring and Dividing Colonies.

1. My bee-book tells how to transfer colonies, but if I do it by the Heddon plan, what is to hinder the parent colony from being robbed during the 21 days, if near the apiary?

2. Why could I not drum them into the new hive at once that has old combs, having it tight around the bottom, not using the forcing-box?

3. If I make swarms by dividing according to the textbooks, will the queenless part rear a queen if there are no queens or queen-like workers at the time the swarm is made, or wouldn't they be worthless, like many other queenless colonies?

4. Would colonies made by dividing, be likely to produce as much surplus honey as if left to swarm naturally?

ANSWERS—1. The supposition is that the bees will defend themselves against robber-bees, but it will be well to help them by contracting the entrance somewhat.

2. That certainly will be better, if the hives are such as to allow it.

3. Set it down as a fact that if you want good queens they must be in strong colonies and in favorable circumstances at least till sealed. That settles the question that the queenless part must not be allowed to rear a queen from the start unless the prisoner would not.

4. Just as much, if of the same strength and having the same advantages.

Spring Requeening—Introducing Method.

If you were to requeen an apiary in the spring with young queens from the South, what method of introduction would you practice?

IOWA

ANSWER—This matter of queen-introduction is such a constantly changing and elusive thing that it is hard to tell a month ahead what one would do. Just as it happens to look at this minute, I suppose I should take the regular way of introducing in the cages that brought them. If I didn’t follow that exactly, it would be to do something that had before proved successful in my hands, without much reference to what had succeeded with others. Explain it as we may, there’s something about the matter that allows A to be successful in one way and B in another, while both

t than the other senses, are often be-trickt, especially if our minds are excited. For instance, I abominate tomatoes. One of the other gave some in a box of pumpkins, that changed itself like a coin, because the corpuscle inside smell so bad. It was not falsehood that allied these clerks, but just the fallibility of the poor human critter.
might fail if they should swap plans. If time was plenty, and it was decided to take extra precautions, this might be done: At the time of day when bees were busy flying, remove the old queen and set the hive in a new place, after first taking from it a frame of brood and bees to put in another hive on the old stand; put the new queen in the removed hive and perhaps two days later return to the old place, giving it back its frame of brood.

Now it’s none of my business, but if you’re requeening with young queens to avoid swarming, I’ll volunteer the remark that in this locality it doesn’t do to make the change too early.

Transferring—Controlling Swarming.

I got a start in bees last summer. Can I transfer or increase, and incidentally control swarming, by placing Langstroth hives with starters under or over box-hives? or does the “A B C of Bee-Culture” (which I have) cover the whole ground? If so, I shall have to follow instructions therein.

Indiana.

Answer.—If you put a box-hive over a frame-hive having its frames filled with foundation, and allow the bees to work down and fill the lower hive, you will probably have, if you wait long enough, all the brood in the lower story, and consequently the colony transferred, and you may confidently count on no swarming. With a little more trouble you can have a surer and quicker way. Put on the stand of the box-hive a movable-frame hive filled with foundation, and put over it a queen-excluder. Drum the bees out of the box-hive until you think you have the queen, and run them into the frame-hive. Set the box-hive over the excluder, and close up any opening over the frame-hive or under the box-hive. A week later look to see if you have eggs below, and if not drum again. Three weeks after the queen is drummed out all the brood will be below (unless it be a small amount of worthless drone-brood), and the box-hive may be disposed of. No danger of swarming. It will be a help in either case if you can get a frame of brood from another colony and put it in the frame-hive at the first.

Stimulative Brood-Rearing in the Spring.

When should I begin, and how much should I feed, to stimulate brood-rearing in the spring? The colonies are pretty weak.

Answer.—Unless you are somewhat experienced, and unless you are very careful, you will do well to let stimulative feeding alone. It may do good and it may do harm. If you feed so as to start the bees to flying out when it is too cold that they will be chilled and lost, it will be a losing speculation. If the bees are started out flying, and then it suddenly turns cloudy when the temperature is not very high, the bees may never return to their hives. It may be a safer thing, and perhaps just as well in the long run, if you see that the bees have abundance of stores, and have all cracks about the hive closed, and then leave them to themselves. But if you think it best to try stimulative feeding, begin when the bees fly out every day at least a little, feeding every evening, or every alternate evening, a half pound of sugar with an equal or greater quantity of water.
DESKS FOR GENTLEMEN AND LADIES!

These desks are made of quarter-sawn oak, first-class finish, well put together, and will please every purchaser. They are an ornament to any home, as well as being a useful necessity. Would make a FINE GIFT for father, mother or sister.

The Combination Desk and Book Case

is just the thing for a farmer or business man, of any kind, to keep his private papers in, and for his books, etc. The drawers have locks, and there are a number of pigeon-holes inside each of the desks shown herewith.

The low prices quoted are f.o.b. Chicago. Send for free catalog. Address,

The Royal Star Combination Game-Board Co.,
773 to 779 Carroll Ave., CHICAGO, ILL.

Combined Desk and Book Case

Size, 66 in. high, 36 in. wide, 19 in. deep. Price, $13.75.

Ladies’ Desk

Size, 40 in. high, 25 in. wide, 15½ in. deep. Price, $22.85.

Outdoor-Wintered Bees.

I am afraid that some of our outdoor-wintered bees have been lost for their own good. Bees in the clover never were quieter at this time of the year.

Ontario Co., N. Y., March 18.

W. G. L. HINZ.

Boulder Co., Colo., March 19.

Bees Wintered Splendidly—Prospects Bright.

My bees have wintered in fine condition, 90 colonies having come thru without a single loss. I hear some of my neighbors complaining of losses, but I attribute it to negligence on their part.

We have had an unusual amount of snow this winter, which insures plenty of water for irrigating purposes, besides a large crop of alfalfa, and the beekeepers are expecting large returns—disappointments not included.

The weekly contents of the "Old Reliable" are as eagerly awaited as of yore.

J. B. WILLEY.

Bees Wintering All Right—Bee-Literature.

We are having a fine winter, and bees seem to be wintering all right so far. They gathered the first pollen on Feb. 17th, and again on March 2d and 3d, but the weather has turned cold again, and they have stopped work. I am employed in a store here, and see a great many people, and have the opportunity to

Bee-Keepers' Supplies.

QUEENS!

Improved Golden and Leather-colored Italian queens are warranted as the best. H. G. QUIRIN.

We have one of Root's best long-tongued Red-Queen Breeders from New York, and a Golden Breeder from Doilittle, who says if there is a BREEDER of queens in the U. S. worth $20, he is one worth that sum. The above breeders have been added to our already improved strain of queens for the coming season.

J. L. Gandt, of Humboldt, Neb., wrote us on Aug. 15, saying that in the colony having one of our queens had already stored over 400 pounds of honey (mostly comb); he states that he is certain that our bees won on Red-Lover, as they were the only kind in his locality and apiary.

A. J. Root's folks say that our queens are extra fine, while the editor of the American Bee Journal tells us that he has good reports from our queens from time to time. We have files upon request.

W. H. Quinney.

After considering the above evidence, need you wonder why our orders have increased each year? Give us a trial order and be pleased. We have years of experience in raising and rearing queens. Safe delivery will be guaranteed, and instructions for introducing sent with each lot of queens.

QUEENS SOLD TO MAIL.

Warranted stock, $1.00 each; six for $5.00.

Selected tested, $1.50 each; six for $9.00.

Selected tested, $2.00 each; six for $10.00.

We have too many Folding Cartons on hand, and QUIRIN Queen $3.00 per 1,000, with rear address printed on in two colors: 50c, $2.50, $9.00.

Spanish and Italian queens, $2.00 each.

ALBINO QUEENS

If you want the most prolific queens—which you want the greatest bees—try our ALBINO. We are the only dealers in these bees with experience. Our clients have not a single complaint to make. The ALBINO is the most prolific bee that can be raised, and the bees from this strain produced twice as much as our other colonies.

Beeswax.

Rendering Beeswax.

With reference to the color of wax I would like to say a word in regard to my own experience with the wax that I have melted during the past five or six years. It is true that beeswax of different colors may be produced in the same apiary, but I believe the foreign varieties have a good deal to do with the color of the wax. In refining the beeswax that was refined, I had one that would have with hot water or hot hard, giving them a dull, dirty appearance that no amount of cleaning would beautify. The secret of bright wax does not lie in the light coloring, but in the melting, which should be very slow. I extract the wax in a solar reflector, then put it in an earthen pot, and set the pot in a dish pan full of cold water, setting it on the stove, temperature and point where the wax begins to melt. Then I push it back and let it melt as slowly as it will, and that is the most important point. I meet the wax half off, dip it off and put it into molds, which I have sitting in hot water. This slows the melting so that I can sell the beeswax. I sell it in small cakes weighing about two ounces each for 2 cents a cake.

My bees are wintering well.

Robert J. Cart.
Fairfield Co., Conn., Feb. 25.

Belgian Hares and Bees.

Prof. Cook was right in saying that Belgian hares were all right for the business, as few animals can be found that will yield more profit than Belgian hares. They can not be raised here locally, as we have had nothing but short crops and failures for over 10 years, which has made it necessary for us to add something else to beekeeping.

Last season was one of the poorest we have ever had. I did not get a pound of surplus honey, and had to feed sugar syrup in order to keep the queen-rearing colonies in good condition for rearing queens.

After purifying the Belgian hares the first and most important thing is to have a place for them that is dry and well ventilated, as they can not be raised in a house. It is almost in the same manner as raising rabbits. A small room called a hutch, about 2x2x1 feet, or larger if convenient. Place a nest in one end of it. 12\x21

PAN AMERICAN EXPOSITION.

Nothing since the World's Fair, at Chicago, in 1893, has stimulated the widespread interest that is manifest, all over the world, in the Pan-American Exhibition, which is to be held in Buffalo, from May 1st to Nov. 1st, 1901. The purpose of the Exposition is to illustrate the progress of the countries of the Western Hemisphere during a century of wonderful achievements, and to bring together into closer relationship the people of the United States and the Republics and Colonies of the American Hemisphere to join in commemorating the close of the Nineteenth and beginning of the Twentieth Century, by holding this International Exposition on the Niagara Frontier.

For this important event, the Nickel Plate Road has issued an attractive, descriptive folder—sample—elaborately illustrating the Pan-American Exposition, the buildings and grounds. The Nickel Plate Road is the short line between Chicago and Buffalo, and affords complete connection from Chicago to Buffalo, New York City, Boston, and all points East, with trains of modern equipment, on which no extra fares are charged; also dining-car service of the highest order. It affords meals in its dining-cars on the individual club plan, ranging in price from $3 to $4 per cent.

Call on any ticket agent for Pan-American folder of the Nickel Plate Road, or address John Y. Calahan, General Agent, 111 Adams St., Chicago.

The Nickel Plate Road has complete accommodations at Buffalo or Niagara Falls, during any period of the Pan-American Exposition, are invited to apply by letter or otherwise to P. J. Moore, General Agent, 15 Farmen's Bldg., Buffalo, N. Y.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, May 5.—The choice grade of white comb honey is 25c to 30c above the fair demand for all grades. Fancy white is still selling readily at 41c to 45c; No. 1 white at 51c; amber at 61c; price of scented honey, 80c to 85c. Extracted, white, ranges from 79c to 84c; brown, 90c to 95c; buckwheat, 59c to 65c. All of the extra grades offered by the market is from 25c to 27c. The range of prices, the lowest figures in each of the classes to be 20c to 25c, and Genper, Beeswax, 3c.

R. A. BERNETT & Co.

New York, May 5.—The market is virtually bare of comb honey, and there is a fair demand for all grades. Fancy white is still selling readily at 35c to 40c; No. 1 white at 45c to 50c; amber at 60c; price of scented honey, 65c to 80c. As to extracted, the market is quiet and inactive, and a certain amount will have to be carried over, prices are declining somewhat. And if the honey is not moved in large lots, consumptions will have to be made. We quote: California white, 70c to 75c; light amber, 50c; other grades, darker, 80c to $1.00 per pound, or by the barrel, depending on the amount. Beeswax very firm at 28c to 29c, and exceptionally fine yellow, 2c.

BUFFALO, May 5.—Beekeepers and Beekeepers.

OMAHA, May 5.—Demand fairly good for the next season. Honey in Ohio continues steady, and moving at 70c to 75c per lb. We do not expect any price change for the balance of the season, as present supply is sufficient to meet the demand, and there is not likely to be a return of increasing prices.

DETAFT, May 5.—Fancy white comb, 14c to 15c; No. 1, 13c to 14c; dark and amber, 10c to 11c. Extracted, white, 70c to 75c; amber, 50c to 60c. Beeswax, 27c to 28c.

M. H. HUTCHISON & SON.

CINCINNATI, May 5.—The demand for comb honey is nearly over, the stock of it also well cleaned up. Fancy white comb is still strong and firm. Extracted is in fair demand; dark sells for 50c; and white down to 60c. Tallow is still firm, at 85c. C. H. W. WERR.

KANSAS CITY, May 5.—Receipts light; demand normal at steady prices. Fancy white comb, 15c to 16c; No. 1 amber, 10c to 11c. Extracted, white, 70c to 75c; amber, 50c to 60c. Beeswax, 27c to 28c.

W. R. CRUM.

ALBUQUERQUE, N. M., May 5.—Honey market is also very quiet. Local demand for comb honey, 75c to 80c; dark, 50c to 55c. H. R. WRIGHT.

BOSTON, May 5.—Fancy No. 1 white in car- tons, A. A. No. 1, 31c to 32c. B. A. No. 1, 15c to 16c, with a fairly good demand. White, 70c to 75c; light amber, 50c to 60c; dark honey this year. Extracted, white, 80c to 85c; light amber, 75c to 80c; dark, 50c to 60c. BLAKE, SCOTT & LEE.

SAN FRANCISCO, Feb. 6.—White comb 12c to 13c. B. A. No. 1 white, 40c to 45c; A. A. No. 1, 30c to 35c; Extracted, white, 70c to 80c; light amber, 60c to 70c; amber, 50c to 60c. Beeswax, 26c to 28c.

Considering the light output of honey last spring from California apiaries, present offerings rate of 100 percent are strong and are mostly of amber grades. The market is quiet at the present quotations. Fanciness and demand is the general feeling that adulterated and imitation honey is being dealt with considerable quantity, which accounts for a great part of the very limited business done in the pure article.

TWENTY MILLIONS IN GOLD

From Alaska during the year 1000.

Five millions of this came from the Nome district. Government officials estimate the output from the Nome district will be doubled the coming season. The Bleshonek, Kongsarok and Pilgrims rivers have been found very rich. There is hardly a creek from Fort Clarence to Nome where bees have not been seen. Tallow is the most important of the by-products of the honey and the propolis is not found, and hundreds of creeks unexplored. A rich strike has been made on the Yellow river, a tributary of the Yukon.

For full information regarding routes, steamship accommodations and rates to all points in Alaska, address C. N. Solick, General Agent, Passenger Department, C. M. & St. P. R. Y., 95 Adams Street, Chicago.

SWEET CLOVER
And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

Sweet Clover [white] .................. 30c 50c 1.00
Sweet Clover [yellow] .................. 50c 1.25 2.50
Crimson Clover ....................... 50c 1.25 2.50
Alsike Clover ......................... 50c 1.50 3.00
White Clover ........................ 50c 1.75 3.50
Alfalfa Clover ....................... 75c 2.00 4.00
Japanese Buckwheat ................. 30c .50 1.00

Prices subject to market changes. Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and pack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

The Danzenbaker Hive.

T HIS HIVE is rapidly gaining favor, especially in the Eastern States, where tall sections and closed-end frames are used to a considerable extent, and within the last year or so the Danzenbaker system has been working its way into California, Oregon, and even into Cuba. At the Paris Exhibition the hive was awarded a gold medal, and at some of the honey exhibits in this country the comb honey from it has carried off the first prize. Some of the finest honey we have ever seen was produced in Danzenbaker sections; and in the opinion of those who have given the hive and system an extended trial, there is nothing to equal it for the production of a fine article of comb honey. Indeed, in some markets comb honey from Danzenbaker sections commands one and sometimes two cents more per pound than other frames.

Mr. Danzenbaker has long been an advocate of warm supers and warm hives; for he has always insisted that, for the production of comb honey, the super and hive must be warm in order to do the best work in wax-building. To a very great extent the Danzenbaker hive is double-walled; and the seams in the super are especially protected by a special paraffin mat which goes with every hive.

The brood-chamber itself has the same dimensions as the regular 10-frame box-tailed Langstroth hive, except that it is shallower; that is, it takes 10 closed-end brood-frames 7½ inches deep and 17 inches long. Each brood frame is supported by a pivot in the center of the end-bars, so that it may be readily reversed. These brood-frames retain all the advantages of frames peculiar to this class; viz., being reversible, they insure the building of combs to the bottom-bar; as there is no opportunities for air-currents around the ends of the frames, combs, as a rule, are built clear out to the end bars. This case feature makes them warmer for winter. When a division-board is used on each side we have, practically a dead-air space around the ends and sides of the brood nest.

The Danzenbaker brood-chamber can be used with any of our 10-frame supers, either comb or extracted; with any of the 10-frame covers, bottoms, or hive-stands, or with the 10-frame Jumbo hive. There are four patents on the Danzen and fixtures.

NOTICE.—The Danzenbaker hive is not made in the 8-frame widths.

MISS ADA L. PICKARD,
Secretary of the Wisconsin State Bee-Keepers' Association.
Red Clover Queens

LONG-TONGUED BEEs ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2; or, one Tested Queen free as a premium for sending us FOUR new subscribers (with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for this coming season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder will use is direct from Italy, having imported her herself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—"first come, first served"—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition and all will be shipped unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash paid for Beeswax. ** This is a good time to send in your Beeswax. We are paying 28 cents a pound—CASH—for best yellow, upon its receipt, or 20 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey
ALL IN 60-POUND TIN CANS

ALFALFA HONEY....... This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY....... This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 95 cents per pound; two cans, 9 cents per pound; four or more cans, 85 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt.

Order the Above Honey and then Sell It.

We would suggest that these bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, I11.
Make Haste Slowly is very good advice. Mr. Doolittle, in the Progressive Bee-keeper, says: "Being hasty in adopting new methods and ideas is unwise. Test them thoroly before entering into them largely. Heavy investments, once in a great while, give large returns, but only too often failure follows, unless one makes haste slowly. Especially is this true of apiiculture." Verily, the one who is wise enough to hasten slowly is likely to be here longer, or have the larger success with bees.

Sowing Sweet Clover Seed.—As several of our readers have requested directions for sowing sweet clover seed, we will quote from those who have had much experience, as reported in Gleanings in Bee Culture:

Mr. H. R. Boardman, of Huron Co., Ohio, writes this paragraph: "For field culture I sow sufficient seed to get a good liberal catch, and not sow more land than I could and do this. It, if added to the acre of the unmixed seed is not too much. The spring of the year I think is the best time to sow it. I will make a good catch on wheat or rye ground, but I think I should prefer to harrow or cultivate it in deep with a light crop of oats."

Mr. G. J. Yoder, of Cass Co., Mo., gives the following about where sweet clover should be sown, and something about cutting and threshing the seed:

"It will grow almost anywhere, even on very rocky hillsides and waste lands, but I prefer to sow where I can keep control of the land and get a crop of bloom and a crop of seed; then the next spring a crop of some kind, and in the fall a crop of hay, or to wheat in the fall, and in the fall a fall a crop of hay."

"Every other year it resids itself; but if put to cultivated crops a few years it can all be killed out. I made a garden-spot on a sweet-clover patch where there were millions of seeds, and in two years it was all gone.

"With us it grows from four to eight feet high, thus making it almost impossible to get it into a thrasher or harrower. But put it with a self-rake reaper, then make a platform on a 16-foot hay-rack, placing it on a skid made of poles bolted together with cross-pieces; then hitch three horses to it, and pull it to the field. With two light poles about eight feet long, and just heavy enough for a man to have, as well as two pitch-forks, we are ready for business. Now fill your platform, not too full; and if the clover is very dry, a few good strokes will land the seed in the bottom of the platform. Now tumble out the refuse; drive up, put more on, and so on around the field. A little experience will show how this should be done. When all is threshed off, run it a thrasher, and you have the bokhara seed."

Mr. Wm. Stolley, of Hall Co., Neb., in an article in the American Bee Journal for the year 1895, wrote this paragraph:

"Treating meatloaf exclusively as a forage-plant, I will say that I have sown 15 pounds of seed to the acre, and secured a good stand. I have sown early in the fall, so as to insure good rooting of the young plants before frost; and I have sown also late in the winter, so as to allow the seed to take advantage of the early spring moisture, with the same satisfactory results. Even the stubble of small grain, or a corn-field, is good enough for sweet clover without further cultivation, except a slight harrowing, and it will take care of itself in this part of the world. I have frequently scattered the seed indiscriminately on vacant places, on public roads, where noxious and worthless weeds were growing, and three years later the sweet clover had run out the weeds entirely. But let me state right here, that sweet clover growing on and alongside of public highways should be cut about June 20th, so as to dwarf the growth of the plants. If this is neglected, sweet clover is likely to grow so rank and high as to make it a nuisance in winter, by causing the drifting snow to hang up, thus making the public road impassable. Many rank weeds, however, generally growing now on public roads, are just as objectionable in this respect as sweet clover. By mowing it the middle or 20th of June first, if the aim is to make it profitable for the apstariist as a honey-producer, sweet clover will furnish bee-pasturage until frost kills all growing vegetation, and is not objectionable in any way to anybody if growing on the public highways. I have seen millions of acres of land over which the honey-workers have been kept up and it keeps the roads in good condition. In a mild and late autumn I have seen meillot thus treated blooming in December, and the bees at work on it here in Nebraska."
Association's influence gets every possible profit and delight out of his bees.

31.-To protect and defend its members in their lawful rights. We insist that bee-keeping is a lawful and honorable occupation, as history, and as much deserving of protection as any other rural pursuit, but ignorance and jealousy are not yet outgrown, and bee-keepers are never safe until they understand and maintain their rights. An efficient organization can do much good toward this end, as has already been proven.

32.-To enforce laws against the adulteration of honey. This is a matter of direct concern and need. Bees in cities and towns are not as well cared for as those in the country, and the danger of adulteration is greater. Pure honey is an article of great importance, and the legislators of every State have enacted laws to protect the purity of honey. This Association purposes to spend money if necessary to enforce them. Pure honey cannot be produced and sold in competition with glucose syrup, and as this substance is the chief adulterant of honey, there is need of anti-adulteration laws in every State, and strict enforcement of the same.

Some of the things this present organization has done.

It has endeavored to prevent quarrels and litigation. The present Manager is for peace if it can be obtained honestly. He does not carry a chip on his shoulder during some one to knock it off. He tries to avoid troublesome lawsuits, and believes he has done so in many cases. This doesn't bring any glory to the Association, but it is beneficial and praiseworthy nevertheless.

With that object in view, a 12-page pamphlet on the benefits of bees to horticulture, and the danger and uselessness of spraying when new, has been prepared for distribution where needed.

Many jealous neighbors have been deterred from threatening attacks on bee-keepers by judicious circulars and letters.

The aid given by this Association to prosecute adulterators of honey in Chicago, in 1899, had a wholesome effect, as we have been credibly informed. If not all was accomplished which was desired and aimed at, the results hastened the branding of adulterated honey in the country so as to denote its true character.

During the fall of 1900 there appeared in many of the Eastern papers highly sensational accounts of a lawsuit between a fruit-grower and a bee-keeper, tried in the court of New York, the defendant's bees had ruined plaintiff's crop of peaches. In justice court the bee-keeper lost. The Association had the case appealed, and after a full trial, at which every argument and artifice known to skillful lawyers was resorted to by plaintiff, the Association produced enough expert evidence to completely turn the tide, and the bees were exonerated.

Had this case gone the other way there is no knowing how many other bee-keepers would have had to quit business or defend a like suit.

The opening of this case, and the valuable precedent establish, which will be quoted in all the courts of the country for years to come, is a triumph for the National Bee-keepers' Association, and worthy many times its cost.

If an Association for mutual protection and the general advancement of the art and science of apiculture meets with the approbation of any bee-keeper who is not already a member, he is hereby invited to co-operate.

The annual membership fee is $1.00. It may begin at any time during the year, and amount sent to the undersigned will be duly entered and acknowledged.

EUGENE SECOR,
Forest City, Iowa,
General Manager and Treasurer.

The number of drones needed in an apiary is a thing upon which all are not yet agreed. At this time of year, when one begins to plan for next season, it may be well to refer to Mr. C. A. Meinert's ideas somewhat settled on the subject, so as to know whether to encourage the production of drones or to discourage it by controlling the kind of comb in the hive. Mr. Meinert's series of articles on this subject will be of great service in the way of helping to decide this question.

The first objection likely to be urged against allowing the presence of many drones is that it is allowing a host of useless consumers that add nothing to the common stock. But if they are of service in other ways, they may earn the food they eat without gathering it for themselves.

It can not be denied that drones may be of real service to help keep up the heat of the colony, but it is replied to this that in the spring, when there is the most need of heat-producers, the drones are wanting, and when they are present in numbers the weather is so hot that a set of fanners must keep at work to make their lordships comfortably cool. Further, it is argued that a pound of workers are just as useful in keeping up the heat as a pound of drones; so the argument for drones as heat-producers is hardly valid.

In an apiary of 50 colonies thousands of drones are flying that are never needed. Why not restrict the number to the 50 or 150 that will actually meet the virgin queens? The answer is not difficult. With the large number always present, it has been many times observed that a virgin makes a successful flight not until the second or third attempt. If no drones were in the air except the one she was expected to meet, the chance of such meeting would be rather small, and the chance of being caught by some bird rather large. Besides, when a large number is present, there is a chance for selection. The most active and vigorous drone is the successful one, and this tends to the improvement of stock. One has but to observe Nature to note that each colony has a large number of drones, and it may not be wise to make so violent a departure from Nature as to suppress nine-tenths of the drones she would provide.

But it is a departure from Nature to mass 10, 50, or 100 colonies in one place, and no more drones are needed for the whole lot than would be needed for a single colony. Consequently the drones may be restricted to one of the two or three of the best colonies, thus adding greatly to the selection of the best.

So the probability is that in the average apiary there need be no anxiety lest there be a lack of drones, and the wise bee-keeper will take advantage of this by seeing that no drones are encouraged in mediocre colonies, but that they are suppressed in all but a few of the very best. If more attention were given to this, there would be a distinct increase in the average yield of honey per colony.

The Weekly Budget.

* * *

The Frank B. White Company, of Chicago, is one of the cleanest and most honorable advertising firms in the world. It is an organization of young men who are banded together to handle the advertising for such firms of business men as desire to use the columns of the general agricultural press. Mr. Frank B. White is the much-respected president or head of the Company, and a man whom to know is to love. Recently he conceived the idea of tendering a dinner or banquet, and sent out invitations, the following being a sample:

Frank B. White,
Chicago, March 29, 1901.
Mr. George W. York, Editor American Bee Journal.
Dear Sir:—I desire to give my business associates, and those occupying the more responsible positions in connection with our business here, a dinner at the Union League Club, Thursday evening, March 31st, at 6:30 p.m., and I trust nothing will prevent your being present.
Very truly yours,
Frank B. White.

Of course we were there, and it was a most delightful occasion. After doing full justice to the bounteous and tempting viands placed on a circular table before the assembled guests, several hours were spent in "after dinner" toasts or short speeches. There were about 20 of the employees of the firm present, and those financially interested. Each department of the rapidly developing business was called on to respond to an assigned topic, and each indicated the sprouting of Chauncey Depew wings of eloquence and wit, Mr. White, as host, speaking first.

The last speaker was the editor of the American Bee Journal after which one of the prominent employees presented to Mr. White a written and signed expression of appreciation and esteem in which he is held by all the employees. It was a sincere testimony, and one highly prized by the recipient, who merits all the kind things that were said of him on that enjoyable occasion.

* * *

Mr. C. Thurmans, of Wabash Co., Ills., about six weeks ago met with a serious accident, his horses running away with him in a sleigh. He was thrown out on a lot of logs lying along the roadbed, while the horses were going at a furious rate of speed. They were frightened by dogs running against them, causing them to become unmanageable. While no bones were broken, Mr. T.'s neck and hips were badly bruised and strained. He is improving slowly, we are glad to report, and all will unite in the hope that he may soon fully recover.

* * *

Prof. Cook having been quite sick recently accounts for the non-appearance of "The Home Circle" department in several issues. He has recovered now, so we trust that all may go on again without further interruption after this week.
Convention Proceedings.

BY ADA L. PICKARD.

The 17th annual convention of the Wisconsin Bee-Keepers Association was held at Madison, Feb. 5 and 6, 1901.

The meeting opened with a fair attendance considering the distance that bee-keepers are required to travel, and the number of Wisconsin bee-keepers who attended the national convention held in Chicago.

Pres. N. E. France asked the convention to come to order, and the meeting with well-chosen remarks after which the secretary read the minutes of the last meeting, which were approved.

The opening session was largely devoted to the discussion of a bill which had been introduced in the Wisconsin Assembly by providing that the number and value of the colonies of bees be inserted in the assessment roll, the same as other personal property.

The bill further provided that colonies of bees be moved about from place to place for the purpose of extracting honey, the tax to be assessed on each colony $1.00 per colony for each month or part of months. When that bill was introduced the State bee-hive was kicked, and each individual made a great roar. The bill was dis- cussed very thoroughly. The bee-keepers did not object to the taxation of bees as the majority now pay taxes on their bees, but it seemed that the assessment varied greatly, and seems very unjust. Thrown the State bees have been assessed from 25 cents to $1.50, and even as high as $2.00 per colony, while selling one of the same size on the market at 25 cents.

The unanimous voice of the bee-keepers favored the taxation of bees, for if bees were taxable property we could claim protection from the State.

It was the latter part of the bill to which the objection was offered. On motion a committee was appointed by the presiding officer for the purpose of writing a new bill to oppose the bill. The committee appointed was N. E. France, Jacob Hoffman, Elias Fox, and Ada L. Pickard.

At an appointed time the committee went before the legisla tive committee and then the work of the committee and the united efforts of the Bee-Keepers Association, the bill has been indefinitely postponed—virtually the bill is killed.

At the close of the discussion pertaining to the bill the convention stood adjourned until 1:30 p.m., when Pres. France called the meeting to order. On motion, Editors Hutcheson, Root, and York were made advisory members.

WINTERING BEES.

H. P. Miner read a paper on "Cellar or Outdoor Wintering," after which there was a lively discussion. Mr. Lapthorn said he had wintered bees both ways, but preferred the single-wall hives in cellars to the chaff hives. Mr. Ochsner favored the chaff hives for winter use, but not for summer, as he has had losses in combs and honey, from the fact that the chaff hives gets so hot during the hot weather, causing the combs to melt down. If chaff hives were used in winter, he suggested that they be transferred to single-wall hives in May. The discussion was summed up in not so much how or where to winter the bees, but to strike the bee-note of success depends upon getting the workers at the proper time for your location.

A recess was given the members for the opportunity of paying the dues to the State and National Associations, and the dollars rolled in almost faster than the secretary could book the names.

H. Lapthorn read a paper on "How to maintain the present prices of honey in the event of a good honey crop." In speaking of the good prices of honey he said, "Dealers go thru the country and buy up the honey from small producers, put it up in good shape and sell it for a good price. It is better to sell to the jobber if not willing or able to hold for good prices; never sell at low prices to retailers."

Here was a simple method of detecting adulteration in extracted honey? Ans.—Mix equal parts of honey and wood-alcohol together; stir until thoroughly mix. If sample contains gluten it will turn cloudy, if not it will remain clear. It does not make any difference what kind of honey you test.

Ques.—How can aster honey be kept from granulating within ten days after storing, regardless of temperature? Ans.—Do not know.

Ques.—Where is the proper place to keep extracted honey? Ans.—In a dry place.

Ques.—What is the best package for extracted honey? Ans.—(a.) The best package for storage and shipping the honey is the 55-gallon barrel. It has been found a great advantage to paraffine the barrels before using, as it saves soakage. The cost to paraffine a 350-pound barrel is about 10 cents. (b.) The best package for retail trade is the 60-pound tin cans, or pails holding 5 and 13 pounds each.

Ques.—Does it pay tocrate comb honey? Ans.—Yes. But the cases should be crated properly with plenty of straw for packing.

Ques.—How many combs should be left in an 8-frame hive for cellar wintering? Ans.—Majority favored eight.

Ques.—Is it advisable for the State Bee-Keepers' Association to recommend an experimental apiary in Wisconsin? Ans.—Yes. It was recommended that the Association recommend to the Experimental Station of Wisconsin to offer to donate his services if such an apiary should be started. A committee was appointed to visit the experimental station, composed of N. E. France, Jacob Hoffman, and Ada L. Pickard.

An adjournment was then taken until 7:30 p.m., when the convention was again well attended by Editors E. R. Root and W. Z. Hutchinson, who presented their instructive and entertaining stereopticon views, which must be seen to be appreciated. The views were most entertaining as being well paid for attending the convention, save the valuable information received from the papers read and discussions which followed.

SECOND DAY—Morning Session.

The morning session opened at 9:30 with a business program. The report of the treasurer was read and approved. The report of the officers resulted in the following: President, N. E. France; vice-president, Jacob Hoffman; secretary, Ada L. Pickard; Richland Center; treasurer, H. Lapthorn. The judge and alternate judge of the apiarian department of the State Fair were named F. Wilcox as judge, and N. E. France as alternate. On motion, the secretary cast a ballot recommending N. E. France as inspector of foul brood.

BEE-KEEPERS' HONEY EXCHANGE.

The secretary read a paper on "The Bee-Keepers' Honey Exchange," by C. A. Hatch, which was listened to with great interest. Mr. Root opened the discussion and mentioned the Colorado Bee-Keepers' Exchange, and said it was a good thing, enabling the bee-keepers to get supplies cheaper, but a bad thing for the supply dealer. The first thing to make the exchange a success is to have a good business man as business manager, who has the interest of every one in mind. It was thought not advisable to organize a honey exchange in this State, because the other State conventions have a chance to keep in touch with the prices.

E. D. Ochsner did not read his paper on "The Outlook for the Bee-Keepers' Exhibit at the Pan-American Exposition in 1901," because an expression of the convention was taken in regard to making an exhibit, and it was thought not advisable to make an exhibit because the appropriation is so small.

F. Minnick read his paper on "Short Cuts in Extracting." It was received with much enthusiasm. A very interesting discussion followed, and many new ideas were advanced. The afternoon session was opened by Pres. France reading and discussing the laws pertaining to foul brood.

The question-box being full, it was again opened.

The agent of the Citizens' Business League of Milwaukee, gave a very cordial call for the next meeting of the Association to be held in Milwaukee. On motion, the executive committee was authorized to name time and place where the next meeting shall be held. The members favored Madison.

The convention then adjourned sine die.

ADA L. PICKARD, Sec.

[The interesting papers read at the above convention will appear later, so far as we are able to secure them.—Editor.]

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is a beauty and is being predicted. We shall have a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.
A at the dinner table my wife past the honey to Mr. Bond, saying as she did so: "Honey is almost as indispensable at our table as water. Mr. Bond. We use it at the rate of a pound per day the year thru. My husband thinks it is better than anything else, and I guess he knew no more than I did this morning about bees, for I remember hearing him mention the 'king-bee,' but never the queen-bee, of the hive. He had some very queer notions about bees, as the Pennsylvania Dutch all have and I never knew one that didn't keep a colony or more. You may have heard about their superstitious notion that when any one dies in the family all the bees will die, too, unless some one goes out at midnight and whispers the sad news to each hive."

"How many colonies of bees have you now, Mr. Bond?" I inquired.

There are some 45 or more. They are not all in one place, like yours, so I can't tell exactly how many there are. You see, I have always been in the habit of leaving them just where I found the swarm when I hived it. My hives are all the old style that my father used—square boxes with cross-sticks in them."

After dinner Mr. Bond returned with me to the honey-house, and, at his request, I took him to the honey-room and showed him my 1,600 pounds of honey, all in one-pound sections, and some of the cases ready for the market. After a minute's contemplation of the stock of white boxes, Mr. Bond exclaimed: "Never, in all my life, have I seen so much beautiful sweetness!"

Returning to my work-room, Mr. Bond turned to me, before he sat down, and said: "Now, then, Mrs. Gehring, will you please tell me, as briefly and plainly as you can, how you manage to get at the rate of 100 pounds of honey to the colony, and inside of 90 days' time?"

"I can tell you plainly enough how it is done," I replied, "but I fear I am not equal to the task of telling it very briefly. It is quite a lengthy and complicated story, Mr. Bond. The best way will be, I think, to take one hive as an example and illustrate the whole story as I go along. To do that, however, it will be necessary for you to go with me to the spot where the hive stands, so that I can explain everything to your eyes, as well as to your ears."

"What do you say to my plan, Mr. Bond?"

Mr. Bond did not object as strongly as I had expected he would, having in mind his manifest enthusiasm. He looked meditatively at the floor between his feet, twirling his straw hat slowly with his right hand, while with his left he gently stroked his nose, which, by the way, had not quite regained its normal size and color. At last he looked up and said: "Your plan is no doubt all right so far as you are concerned; but it looks a little bit risky-like for me. You see, I cannot quite forget my little unpleasantness with your 'well-behaved bees' this morning."

"But I shall fit you out with a bee-knight armor that thoroughly protects your face. Your hands you can put into the bee-pockets, if any attack is made on them. And, in the event of an attack, I procured from a small closet two bee-veils and a Bingham bee-smoker, and, handing one of the veils to him, I said: "The right kind of a bee-veil is a valuable article to any bee-man who has been recently stung. These circumstances. This is my own invention, tho not patented. I have seen some that are patented that I wouldn't have as a gift. This one, you see, is a very simple affair, not much larger than a man's hand. I will tell you how to make one like it, then you can get the material before you go home, and show your wife how to make one:

"Take half a yard of cheese-cloth and double it lengthwise. Sew up the open side about half way. Cut the other side with a pair of scissors to correspond lengthwise. Hem or bind the raw edges. Insert a rubber-cord band intended for the top, short enough to fit tightly around the crown of your hat, like a pucker-string. Now take a piece of silk bobbinet large enough to reach from the middle of your forehead to your chin, and from one ear to the other, and insert it in a square hole in the front of the upper end of your cheese-cloth sack in such a way that when the veil is in place the little silk veil is directly in front of your face. The open side of the face veil is called the front, and the other end is called the back of the veil. I hope this is now—carefully tuck inside your vest, or your coat when you wear one—which is then buttoned up, and—are there you! Your hat-rim should not be very wide, of course, unless you make a long veil like the one I have described. The meshes of the silk bobbinet should be rather fine, but not too close to obstruct your vision.

"Now, when you call for this bobbinet stuff at the store the clerk will possibly tell you that the cotton kind will do just as well, and is cheaper. But, let me caution you, never allow any one to induce you to take anything but just what I have told you. If you ever do, you will find out why I have warned you, without my telling it now.

"Now, I continued, 'I will start this little machine we call a smoker, and then we are ready for business. Let me show you how to manage the thing properly, Mr. Bond. First, you see, I remove the end, or nozzle, taking care not to remove any of the circular rings which hold it in place. Next, I take a cotton or an old linen rag, light it with a match and drop it to the bottom of the cylinder. Then I carefully drop in some more rags, gradually filling the smoker, but rather loosely, so that the fire is not extinguished. I leave the smoker standing nozzle-end upward all this time, you see, because in that position it acts like a chimney. When it is full and well started I replace the nozzle, put a handful of fuel-rags in my coat-packet, take the smoker and give it a few minutes."

On the way to the hive I said to Mr. Bond: "All the bee-books in use recommend the use of broken corn-cobs or punk wood as smoker-fuel. But I don't like either. Both are liable to become damp, and they are not as easy to start as other fuels. Besides, they are more dangerous. Bees are very much on the way in the smoker they make too much heat. When I need a smoker in a hurry—and that is almost always the case—give me cotton-rags for smoker-fuel every time."

"Well, here we are," I said, proceeding to remove the cover of the hive I had selected for the purpose in hand. Then taking the smoker and giving it two or three vigorous puffs to start a good volume of smoke, I went to one side of the front of the hive and blew smoke into the hive thru the bee-chest for some time. Afterwards, when it stopped smoking, I removed the smoker with slow, steady pressure, so as not to alarm the bees with the puffling noise made by the smoker when working with a short, quick motion.

"I then told him how to fill himself with honey," I explained to Mr. Bond, who was standing a few feet away with his hands in his pockets, watching the proceedings. "We will now wait a few minutes until they have drained themselves."

"What do you do that for?" asked Mr. Bond. Instead of giving him a direct answer I said, "Come and put your ear down near the top of the hive and listen for a moment."

Mr. Bond did so rather reluctantly; after a few seconds, and I said: "You hear them as if making a humming noise, don't you? Well, they make that noise to express their satisfaction. It makes them lazy and good-natured when they are full of honey. Bee-keepers know this, and take advantage of the fact when they have a tedious job of manipulation to perform in the apiary. These bees, you see, will be less liable to fight now, or to take wing and give the alarm signal to the hives close by."

(To be continued.)
Weak Colonies in Spring—When to Unite Them.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes that many of his colonies of bees will come out weak in the spring, and wishes me to tell him in the American Bee Journal when and how to unite them.

When colonies of bees come out weak in the spring, it makes one wonder if these two weak colonies are going to survive. If so, they must be united, so that one strong colony may be made from several weak ones. Some suppose that if any uniting of weak colonies is to be done, the earlier in the spring it is accomplished the better the results will be. But from my experience along this line I am positive that such early uniting is a mistake. From some experience several years ago, I came to the conclusion that each would go thru the early spring better alone, and to test the matter I tried the following experiment: I had ten weak colonies and united six in one hive, three in another and left one alone, which was scarcely an average of the whole, as to strength of bees. This uniting was done in the latter part of April, and one and two weeks' time the colony formed by uniting the six was all gone. During the same time the one not united "held its own," while that where the three were put together was scarcely better than was this.

One of the bees having no help had by actual count 85 bees besides the queen, and the one made from the three was 105, according to an entry I find in my diary. As I was then anxious for all the bees I could get, I did the best I could with them without help from other colonies. The bees that were united were stored with honey, besides having enough for winter, the same coming from buckwheat. And other experiments made since then gave like results, so that, of late years, I have ceased altogether to unite in the spring.

After a careful watching I find the reason for this seeming inconsistent state of things to be, that with united colonies the bees seem to be invited to greater activity, by strange bees being thrown together, thus starting a larger and more universal division-board, and their little wear and tear reaching a point where they perish from exhausted vitality, or old age, before any young bees emerge from their cells to take their places; while those not united do very little, and rear only enough brood to take the places of those slowly dying off, keeping their numbers about good till settled warm weather comes, when these few (now) young bees are able to hold five times the brood they could in early spring, so that they now increase rapidly.

From the above it will easily be seen why I would not unite colonies in the season. Of late years I have united just before the honey harvest, as I consider it more profitable to let each colony go thru the season separately, as I did the one having 85 bees. If these colonies were divided among themselves, the best we can hope is that they will become strong enough in bees and honey for winter; while by uniting just before the honey harvest I secured a good yield of honey from the united colony and get the two in good condition for winter. My plan of work in uniting, and looking toward this end, is as follows:

As early in the spring as the bees can be looked over, all of the weaker colonies are shut on as few combs as they have brood, by using a division-board to contract the hive. They are now left till warm weather comes, being sure that all have stores enough where they can conveniently reach them to carry them until this period. They are now built up as rapidly as possible by reversing the brood, etc., so that by June 1st the best of them will have five frames of brood and small stores to carry them down to one for the very weakest. As soon as the best has its five frames filled with brood, down to the very bottom corners, a frame of hatching brood is given to one having but four frames, and an empty comb put in place. By adding a frame of hatching brood in this way I generally take all the bees there are on it right along, only being sure that I do not get the queen, so that all the young bees on this comb help to give strength to the weak one, as the younger ones will not return to their old home.

In a few days a frame of brood and bees are taken from each of those two five-frame colonies, and given to the strong one, and the process is continued till all have five frames each.

Do not make the mistake some do and try to strengthen the very weakest first, for by so doing from one-half to two-thirds of the brood will be liable to perish with some cool spell, as these last colonies have at this time all the brood they can properly care for.

By the above plan we are always safe, and advancing warm weather is in our favor also. In a few days after all have five frames of brood, we are ready to unite, and if all has been done as it should be, the uniting will be done about the time white clover begins to yield honey nicely.

To unite: Go to No. 1 and look at the frames over till the queen is found, when this frame having the queen on it is loosened and put in with the hive. If the hive is divided in two parts in No. 2, when the four frames of brood, bees and all, from No. 1 are carried and placed in each alternate space between the frames of No. 2, closing the hive. Return the frame having the queen on it to No. 1, placing beside it an empty hive, in which the division-board will be placed, and the work is done. In two or three days, put the sections on the hive No. 2, and see what a pile of honey they will store up. At the same time place an empty frame, having only a starter in it, between the two filled ones in No. 1, and in a few days one will have a frame filled with as nice worker-comb as you ever saw, which is much cheaper than to buy foundation. Nearly all the old bees carried to No. 2 will have returned by this time, so that No. 1 is a splendid nucleus, just right for building straight worker-comb, and by giving empty frames as needed this colony will be in good condition for winter, while No. 2 will have given three times the honey the two would have done if left to themselves, or had they been united in early spring.

No. 14—Interesting Notes on European Travel.

I THOUGHT that I had well-nigh exhausted the narration of my trip, but our kind editor has the desire of inserting in the American Bee Journal a photograph of the birthplace of my father, Chas. Daumbie, taken from the collection of an amateur photographer who has been dead many years. This photo was taken some 40 years ago, and it would appear, from the half-tone, that the original picture was good, although we are not justified in judging the appearance of the trees in the view.

It was on the 22d of May, 1817, that my father was born, 84 years ago, in the large house at the back of the picture. The nearest building, on the left hand was a blacksmith shop, and you can readily see two large grindstones under a brush shed. The church was being rebuilt, and they are putting the new building right over the old one. The whole village was absolutely deserted; the people had temporarily abandoned the work and boarded up the unfinished portion. The column in front of the church is a public fountain, and it is still there. The near house on the right is a grocery store. The houses, the roofs, as will be noticed, are of slate; the roads, entirely of stone. It takes rafters of wonderful size to bear such a load, and the attic of one of these houses looks like a monstrous structure, but once they are put up, the roofs last till the wood is entirely worn out. The rafters crack under the weight.

The trees at the back of the picture, which seem to flutter in a strong breeze, are on each side of the highway which traverses the village, and the little river is just behind that. At the time when the picture was taken, the public highway was the only means of communication with other towns, but of late years they have been supplied with railroad facilities, telegraph station, telephones, etc. The church is now finished and is a much finer structure than the one in the picture.

This village, Vaux-Sous-Aubigny, is the one which I mentioned in my second letter, page 629. It is the birthplace of my grandfather, when I was a boy, and which I visited with so much pleasure. I had been told on the way to Europe, by foreigners, who, like myself, had visited the home of their boyhood days, that I would find everything changed from what they had known; but no one ever thought to remind me would be very indifferent, and that it would be an all-around disappointment. Such was not my experience, although I had come prepared for a change. In this village as in one or two others that have been visited, and also in the city of my birth, six 20 miles from there, I found plenty of friends, old and new. As a matter of course, the new friends were all apiarists. The treasurer of the old college is an apiarist of some note, and I have seen strange influences with the greatest pleasure. He took pride
in showing me, on his desk, a copy of our "Lang-stroh Revised," with my father's autograph.

In one of these little villages, not far from the one in the picture, I met a man who used to drive a wagon for my maternal grandfather, and with whom I used to ride back and forth to school holidays, when I was 10 or 12 years old. This man, who was then about 32 to 35, is a bee-keeper, and as such I certainly have a right to introduce him to my readers. I must, however, own that he has none but straw skeps, and is not very progressive. When I went to see him during my last trip, he was out in the harvest field with his hired servant and his wife.

The house was made of the cradle, the woman was raking the wheat, and the old man was binding. He is now upward of 70. I walk up to him, he straightened himself and stared at me as in wonder whether the strange visitor was not out of his way. I ask, "This is Mr. V."

"Yes, sir, that is the way," I said.

"Well, I am an old acquaintance," said I. "Oh, I believe you are mistaken, I never saw you before."

"Look at me well: you know me; you have carried me in your arms."

"In my arms? You must have been smaller than you are to-day."

I gave him my name. The poor old fellow hugged me as if I had still been the little boy he had known, and said, "Is that you, my little fellow? and did you come all the way back from America to see your old friends?"

The harvest was dropt for that day. He took me back to the village and we had a good visit, and you may think how much we talked about. We went to look at the bees, but did not stay long with them—we had too many other things to see.

Around that vicinity a new impetus is given to bee-culture, for they have an important bee-association, which comprises a land division covering about the space of one of the small New-England States. This association is beginning the publication of a monthly bee-paper, "Practical Bee-Culture" (L'Apiculteur Pratique), which is very nicely gotten up. Whatever they do, the Europeans are not behind in the number of their bee-publications, for, in France alone, there must be some 10 or 12 of them, published in different places. I have not seen them on my desk now, and they are all wide-awake, all bent upon giving the peasants out of the old rut as rapidly as practicable.

But in these ancient places we saw some very queer people, with very extraordinary ideas about America. A fellow in our city asked me to come with him to pay our respects to a couple of old ladies who had known my folks long before my birth, and who express a wish to see me. They were between 75 and 80 years old. My daughter accompanied me and we were heartily welcomed. The old ladies asked why we had written the usual compliments, raised her spectacles, and looking at my daughter with unfeigned astonishment, said: "Why, your daughter is as white as you are!" She had evidently imagined that, living in that wild country—the backwoods of western America—I had married the daughter of some Indian sachem, some redskin Pocahontas. This amused my friend, as you may understand, and he laughed heartily, and went to great trouble to explain to these good ladies that America was not peopled with such ugly fellows, and that there were many families of the Caucasian race scattered over that great wilderness.

Now, Mr. Editor, I will close this too-long narration which has been continued thru 14 numbers, I will ask forgiveness of those bee-keepers who have followed me thru my hopes of getting a little bee-culture out of this talk, for they have been sadly disappointed. I will also express my thanks for the many kind words spoken in private correspondence by some who seem to have enjoyed my too-personal recollections of the most agreeable voyage I have ever made.

Hancock Co., Ill.

Birthplace of Mr. Chas. Dadant—Taur-Sous-Aubigny, France.

No. 3.—A Review of "A B C of Bee-Culture."

By Prof. A. J. Cook.

(Continued from page 197.)

Page 277.—A word about the queen dying because they have lost their sting. Several times I have had my students secure bees that have lost their sting, it having been pulled out consequent upon use. These were put into a cage and fed. Other bees, uninjured, were put into a cage and fed in the same manner. In two or three days all the first bees were dead, and none of the others, nor were the latter dead for days, even weeks. I would not wish to be understood as holding the view that stinging will necessarily kill a bee, as a slight sting would not pull the sting out and might not do any serious injury. But I believe that when the sting is extracted, it will always end in the death of the bee. The time, however, will vary, which argues that in some cases more injury is done to the internal organs than in others.

Page 290—I am a little skeptical as regards the queen leading out the bees. I would not be sure that Mr. Root was right in his conclusion. This may have been a normal swarm and the queen may have followed them to the old hive rather than have been led by them. In all my experience, I have never known a queen to lead a swarm. Her presence, however, will have much to do in forming the cluster, as every apiarist of experience knows.

Page 357—I think Mr. Doolittle is a poorer philosopher than he is an apiarist. I should have great respect for any opinion he might give in reference to bee-keeping. I am not at all sure of his dictum with reference to swarming. Surely bees do swarm out of their hive from other cause than the instinct to increase. Indeed, I think the old idea of instinct as being the unvarying and inerrant guide of insects and other of the lower animals in their actions will more and more be modified. I think now that our best naturalists are giving it up. Is not all instinct the result of previous acts guided by intelligence? Acts, repeated many times under volition, result in a habit in which case action becomes almost automatic, hardly guided at all by the will. Action that has long been habitual will after a time become almost unvarying, and becomes, perhaps, wholly automatic. The physiologist would call this reflex action with the gray matter of the spinal cord as a center. With man, and to a less degrading degree with other animals, the intelligence often interferes to modify habit and instinct. I believe this is equally true with bees and other lower animals. If I am correct, then swarming will not always follow from the same cause. I think every apiarist will recognize that varying conditions will very greatly modify the habit, or instinct, if you please, of swarming.

Page 362—I was surprised to note that Dr. Miller also gives his authority in favor of bees not clustering in case the queen does not go forth with the swarm. I have always been surprised at such assertions. For many years, I practiced clipping queens' wings, which I believe is always wise policy. I have had hundreds of swarms go forth where the queen was clipt, and so of course could not join them, yet I found it very rare that the colonies failed to cluster. In such cases they will always return to the hive, but in my long experience and observation, it will be
decidedly the exception and not the rule that they return to the hive without forming at least a partial cluster.

Page 299—Mr. Root in referring to turnips writes as follows: "If they are turned under just before going out of bloom, they make one of the most valuable of soil-ing. Thus a good turnip pasturage may be obtained with no extra work except sowing the seed, and the crop will be an actual benefit to the soil if turned under." Has not Mr. Root ever visited his intertubular chamber? A turnip is soil-ing used to refer to cutting green herbage for immediate feeding. When we cut green corn for our cattle, we are then soil-ing. Plowing under a green crop, as I understand it, is not soiling but green manuring. I think, also, that the green crop that works best that with the same crops of the best crops for green manuring. They would add no manurial element to the soil. They would be of advantage in adding humus. They are not very deep-rooted plants, and there is a large amount in the air and combining the nitrogen, it can be utilized for the production of the best crops by the bee forage. Some of the most valuable plants for the bee by excellence for green manuring. The man who is content to plow under the cereals like oats, barley or rye, turnips or weeds, instead of some legume, like clover and peas, is content with a half loaf when it was just as easy to secure a whole one. This latter is all the more valuable in view of the fact that nitrogen is the most expensive fertilizing element which we need to add to our soil.

Page 306—Is it true that all the moisture that is found in the hive, making the sticky mass after bees have been suffocated, comes from honey that the bees have regurgitated? I think there is good reason to believe that much of the moisture found in pollen is the result of its act of respiration. In such cases, bees try hard to cool off. The only possible way that they can do it is by evaporation of water. That they function in some way analogous to our sweating, I think there can be no doubt. That perspiration from the body, I believe the representations will prove that such moisture is more in evidence on such occasions than the honey which the bees regurgitate.

Page 308—Here, again, our author refers to bees separating water from honey while on the wing. I believe this is physically impossible. I have never yet seen this "mist" fall from the bees while flying in the air. The statement has so often been made by others who thought they had seen it that we can hardly doubt but that it had some basis in truth. If such mist does fall from the bees, it is probably by evaporation in the air-tubes, or else excreta from the intestines. This is certainly a matter which deserves very close investigation.

Page 310—The Chinese wax referred to on this page is the product of an insect. It is one of the scale insects or coccids. Thus it is related to the cochineal insect, which, as is well known, gives us our carmine dye. This Chinese wax is very white and is used for making candles. As Mr. Root well says, it is too expensive to be used to adulterate beeswax, and, more than this, detection would be very easy.

Page 321—In speaking of the willow, it is stated that it does not furnish honey, and the late Mr. Quinby is quoted to the same effect. This is certainly not true of all our willows. As is well known, the willow, like our pepper tree, is dioecious, that is, the male and female flowers are on different trees. I have seen the male bloom and over again thick on the blossoms of both. They were visiting, one for pollen and the other for honey. True they might get honey from the willow Apis, a plant-which is used in common gardening. The carvote, or the white willow, in various cases has shown me that they were visiting flowers and gathering nectar from trees not at all infested with plant-lice.

Page 322—On this page, Mr. Root gives an admirable illustration of a paper called "Comparable platy, the willow." Curiously enough, in giving the scientific name he exchanges the generic and the specific names. The plant is known as Epilobium angustifolium, and not, as he puts it, E. angustifolium. E. angustifolium is worthy all the good things he says of it. It is not only excellent for honey but has a most beautiful flower. This plant comes up thick over the burnt areas of northern Michigan, and so is often called fireweed. This name, like that of Indian-pink, is unfortunate, as these names are also given to other plants which are very different.

Page 335—Is it true that dark honey is more unsuitable for wintering than other honey? If we give the reason that some bee-keepers argue, that honey is the transformed nectar of flowers, then surely the above is not correct. It is true, however, that bees often gather nectar from barks, or scale-insect secretion, which I think they transform into honey and store in their hive for use during the winter. While I would not wish to use this latter in any climate where bees can not fly frequently, for purpose of winter food, I should not hesitate at all to use honey from any other dark floral honey for winter food in the apiary.

Page 348—In his glossary, our author gives Apis as the family to which the bee belongs. This should have been the genus to which the bee belongs. I think, with one of our bee-keepers for me to give the groups from first to last in succinct form, to which our pets of the hive belong. The phyllum or branch, which is used to be called Articulata, and which included worms, is now known as Articulata. This is the class Hexapoda, or insects. The former name is given because they all, in the mature state, have six legs. They are called insects because their body is cut up into three well-marked portions, head, thorax and abdomen. The other rings and joints are called these three divisions. Of course this class does not include the lobster class, with their varying number of legs, the eight-legged spiders, or the many-legged myriapods.

The bee belongs to the order Hymenoptera. This word comes from the Greek and means membranous wings. They are so called because they have thin wings like those of the common house-fly. This order does not include butterflies, two-winged flies, beetles, bugs, locusts, etc. The family of the bee is Apidae, a word signifying honey-bee, as the typical genus is Apis. In this family, the larvae are always fed on pollen, and thus the bees are always provided with means for collecting this valuable food substance.

We have a great many bees, from the huge bumble and carpenter bees down to the small solitary bees which are often very beautiful. With very slight exception, none of the bees ever do any harm, and all of them will co-operate with the honey-bee in the valuable work of pollinating the flowers of our fruits and vegetables. The carpenter bees sometimes bore into cornices and window-casing of houses, but rarely do any serious mischief, and can always be killed by the use of a mustard, a kerosene oil. The genus of the honey-bee is Apis, and includes all those bees that have their hind legs best fitted for carrying pollen, and have no tibial spur on these legs. The species of the honey-bee is mellifera, the source of our honey from which we have domesticated, of which there are several races, as the Italian, Syrian, German or Black, Carniolan, etc.

In concluding these views of our three most important bee-books, I wish to say that the task has been altogether pleasant one. There is so much to communicate, so little to criticise. I am proud of our bee-books, and am proud of my brother authors.

Los Angeles Co., Calif.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

Note.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons; as it will cause people to ask questions about the busy bee, and many of my bees have started me up a very good sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many people the truth about bees and their honey."

Conducted by

Dr. C. C. Miller, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail. — Editor.)

A Beginner's Questions.

My bees were put into winter quarters very light in store, and I think they won't have enough to bring thru till spring opens. I began feeding too late in the fall, and cold weather started in, so they didn't have time to store much.

1. Can I feed them before good weather comes, or will I have to wait till good weather comes in the spring?
2. How large should the hive-bee entrance be in the spring of the year?
3. Will bees taken from a bee-tree in the woods swarm as much as tame bees do?
4. How much honey does it take to winter a colony of bees?
5. What time do bees generally begin swarming in the spring?
6. How can a person tell when the bees are to swarm?
7. Will bees taken from a tree store as much honey as a tame swarm?
8. How long does it take a new swarm to fill up the brood-chamber after they are hived, when there is lots of honey in the fields?
9. How many times should bees be allowed to swarm?
10. Should the entrance-guard be kept on when robber bees are troublesome?
11. How long does it take bees to fill a super when there is lots of honey in the fields?
12. Where do the bees gather propolis?
13. Should bees have shade on a hot summer day?
14. Do bees need any salt in summer when they build comb?
15. How can I prevent second swarms?
16. Do bees store any nectar from corn, pumpkins and cucumber blossoms?
17. Will putting supers on a ten-frame hive prevent swarming?
18. Do the drones build comb and gather honey when newly hived?
19. Should the honey-board be on top of the frames, that is, between the super and the frames?

Wisconsin.

Answers. — 1. If they have enough stores to last till that time, wait till weather when they are flying. But if you fear their starving before that time, don't wait; you may as well disturb to death as to let them starve to death. If you feed before they are flying, you must make sure they can get the feed. Hang a Doublet feeder close to the cluster, or give them a brood-comb containing syrup, or give them candy right over the cluster.
2. No larger than in the winter, if as large. Anywhere from one to three square inches, according to the strength of the colony.
3. Fully as much.
4. It varies greatly: from 6 to 25 pounds or more. The size of the colony, the character of the winter, whether wintered in cellar or not, all have to do with the matter.
5. If wintered in the cellar, about the first day they are taken out. If wintered outdoors, perhaps about the last of March in Wisconsin. But these are hunger-swarms, or swarms because there is something wrong. Normal swarming for increase comes later in the North than in the South. In Wisconsin there may be rare cases in the last of May, June being as early as it generally begins.
6. By finding a number of queen-cells started in the hive. If a colony swarms the second time, it will generally be somewhere in the neighborhood of eight days after the first time swarm.
7. Just as much as another of the same strength. You will find the colony taken from the tree just as tame as any other.
8. That depends upon the size of the swarm and of the hive, and the time of the swarm. It may be a week, and it may not be till the next year.
9. Once or less.
10. It will be a little help, but is not commonly used for that purpose. Strong colonies are a better guard against robbers.
11. It will be excellent work if done in two weeks. It may be less, but it is often a week more before all sections in the super are sealed.
12. From the buds and twigs of poplar and other trees. It is desirable.
13. They seem to have a liking for salt, and a few bee-keepers take pains to furnish it to them. It perhaps has more attraction to them than comb-building.
14. The swarm on the old stand, and set the old colony close beside it, both facing in the same direction. A week later move the old colony to a new place.
15. Yes; much from pumpkins and vines of that sort, but mostly pollen.
16. Yes, it will be an excellent plan if there are bees enough to fill them; but it may not prevent swarming.
17. I have never seen them engaged in such occupations when first hived.
18. That is the proper place for it if you use one; but honey-boards are not as generally used as formerly, except as queen-excluders.

Spring Questions.

1. I put into winter quarters an even 50 colonies, about 50 Italians and 50 balance blacks. In the fall I ran them all together, made two rows, 12 in each row, back to back, and covered with gable roof like a house. From some cause my Italians went into the winter with less stores than the blacks, but I thought all had an abundance, and could have, though taken two frames from each hive, but as it has turned out fortunately for them I did not do it.
2. Feb. Ist I put them all on their summer stands. At that time I thought they had plenty, but, for fear, I fed all the Italian colonies about five pounds of syrup each. Sunday, March 17th, as I was looking at them I noticed from my best Italian colony the bees crawling all around the front of the hive on the ground, and many dead bees. I got the smoker and looked into the hive and found they were starving not one bit of honey. All my Italians are in the same fix, but not quite so bad as that one. The blacks are, most of them, able to go through but not begin to feed, but I fear too late. What shall I do? We have had no winter, scarcely a day but what the bees have been flying. The peach-trees are all putting out in bloom yesterday and to-day; elm and soft maple are also in bloom, and the early wild flowers. Do you think the elm, maple and peach will provide food for them—that is, can they hold their own on that, or will they keep getting shorter of food?
3. Was it you that made a visit to Sebastian Co., Ark., some weeks ago? I have forgotten who it was. If you kindly give me your impressions on bee-keeping and probable success in that portion of the country, as I live only 75 miles from Ft. Smith. The bee papers give as very little information relating to our part of the country, in fact it's all for Northern bee-keepers.
4. Why have my Italians fallen behind the blacks? The Italians did store just enough honey to carry them thru the winter, but it has turned not enough to do that, while many of my blacks had from 1 to 2 supers of surplus. One early swarm of blacks stored 252 pounds surplus. I bought queens from several of the leading queen-breeders last year, but had very poor success with them. Does it take more stores to run them than blacks? or why is it they are all just ready to starve?
5. I want to clip all my queens. When would you do it—right now, or wait till they are strong &a As they now are they not only open a hive but the robbers are right after me, and just cover the hive after putting in feed. I have to close it entirely up tight. I am nearly discouraged. Tell me what to do, and I will be so thankful.

INDIAN TERRITORY.

Answers. — 1. It is quite possible that the bees will be able to take care of themselves, but it will be well to make sure by giving some feed. In any case it will not be lost. You are fortunate in having weather when they can fly nearly every day, for that makes feeding an easy thing.
2. I have never been in that part of the country, and can give you no reliable information about it.
3. I don't know why the blacks should have done better
than the Italians. Possibly you have black bees that are unusually good and have been unfortunate in not having the best of Italians. More likely the treatment had something to do with it. The blacks were perhaps interfered with and the other bees, the common black bees, queen-cells, etc., the Italians would not have so good a chance. As you had an open winter, the bees flying nearly every day, the bees would use more stores in winter, and it might be that the Italians were extensively put two inch stores faster, but that would not account for the great difference in the amount stored last summer. There is room for considerable suspicion that the blacks had the better chance.

2. Try not to open hives unless absolutely necessary until time of robbing is over, when the bees will get enough to do on flowers that they will turn to honest pursuits. Certainly you should not clip till you can do so without harm to the bees. If you are obliged to open hives, better do it toward evening; then there will be less danger of starting robbing, and if it should trouble a little, darkness will soon come to your relief.

A Dozen Questions.

1. The burning question with me is how to winter bees. This is the fourth year I have tried them in North Dakota, the north of the United States. That year I have them in the same frame building, I have 11 hives closely packed together, and on top of each other, and covered with some wheat chaff. I gave no upward ventilation, left the honey-boards sealed down, put a wood tray, two inches deep under each hive, and with wire-cloth on the entrance 2x3 inches. No ventilation on the bee-house ceiling, above the ceiling it is packed with chaff. The house is warmly built, and an extra door on this winter, which gives two air spaces. I went in last week, and the thermometer was 29 degrees above zero. I could hear the low hum in all the hives I could reach.

Last season on account of the dry weather I got only about 10 lbers. of honey, and surplus honey from the 3½ colonies, spring count, and in September when fixing them for winter I thought they had enough to tide over till spring. Two years ago I took your advice and sowed sweet clover; but for that, last season would have been a blank for honey. The past seasons I have kept down natural swarming by dividing, and extracting from the top hive. The coming season I would not seek more than one swarm from the strong colonies, and would like to know the best methods of dividing for increase. Guided by the American Bee Journal I have tried several ways, but had many failures. I seemed to lose at least time, honey, and sometimes bees. When is the best time to divide; and I want the half of the hives? What is the best time and place where there need to destroy the extra queen-cells they make?

3. I sent South and got a good many young queens by mail; they all came in good order, and there were some fine ones to choose from. I am not satisfied with them for lack of care on my part, not looking out for the other queen in the hive. Now tell me how long they should be without a queen before they have one introduced?

4. If making a nucleus could I take a frame of brood with bees on it and introduce a young queen at the same time? or how many days after?

5. How far apart should nuclei be set to make it safe for young queens to enter her own hive?

6. Do you advise me anything to do with my queens getting lost sometimes?

7. Is there any danger of crowding too many bees into a hive? In September, when taking off the upper story, there were so many bees that they could scarcely all get into the lower hive. Would that hurt them in wintering? or would it be better to give some of the bees to a weak colony?

8. Is there any danger of killing the queen when you mix together bees of different colonies? How do you prevent it?

9. In taking a frame of brood and bees from a strong colony, to build up a weak one, will these bees be liable to kill the queen?

10. Would there be any danger in introducing a young queen to the part that is queenless, after dividing a strong colony? How long should it be before you give it one?

11. Would the bees receive a matured queen-cell as readily as a queen? How long should they be queenless?

12. In dividing a strong colony, how or where would you place the hives?

MINNESOTA.

Answers.—1. It is possible you may have to give up the idea of wintering in that house. It is a hard thing on bees to be in a place where the thermometer stands at 29 degrees continuously. You may say it is much colder than that outdoors. So it is, but when a warm day comes the outdoor bees can have a flight, whereas your bees will not. It is questionable if you should leave the covers sealed down, but if there is a sufficient amount of warm packing over, and once they will be fine. I put two 2-inch trays under the hives is good, but it is not a good thing to fasten the bees in the hive with wire-cloth. When bees want to come out of the hive to die, they ought to have that privilege. You might find that the bees would merely stay there. So as soon as a day comes that is still, with the sun shining, and the thermometer 48 degrees in the shade.

2. If you want no more than one increase from each strong colony (and you are wise in desiring no more), it is possible that natural swarming would be the best thing for you. With that it is easy to prevent second swarms. If you divide artificially, do not begin before the time of swarming is nearly at, there will be no need to destroy queen-cells. Perhaps the nucleus plan may suit you as well as any. Take a colony that is very strong and has a good queen—if not as strong as you wish, make it so by giving brood in advance from other colonies—and take queen-cells with you from these colonies, and put in an empty hive on a new stand. Seven to nine days later form nuclei, giving one each two or three frames of brood and bees from your queenless colony, and seeing that you have one bees to a frame. The queen-cells are at the outer edges of the combs, put them on the central surface, fastening them with a staple or nail. Put the hive with the old queen on the old stand, putting a nucleus in the part of the queen. A week after forming the nucleus give each of them a frame of brood from the other colonies that have not been disturbed; a week later still, one or two frames of brood; and so on till you have a full colony.

3. You may be successful by removing the queen at the same time you give the new one, providing the new one is not releasable too soon; but it is safer to have the new queen releasable four or five days after the removal of the old queen, and to make sure of this with the usual shipping-cage the old queen should be removed two or three days before the new one is put in the hive.

4. If the queen is caged, she should be put into the nucleus at the time it is formed. Two days after it is formed there would be much risk to the nucleus and queen.

5. If the nucleus was formed with queenless bees—and generally it should be—then any kind of a queen, and especially a very young virgin, could be given at once without caging.

6. If there are more than four of them they need not start at all. Two of them may be side by side, almost touching, with the other two facing the opposite direction, the two pairs standing back to back. Then another group of four may come with four feet of space between the two groups, and so on.

7. It may be.

8. Don't be afraid of too many.

9. Generally one of the queens will be saved, but it is well to take the precaution to kill a day or two in advance the other one of the bees you get.

10. Not much danger unless you add nearly as many bees as were already in the weak colony.

11. If the queenless part is put on a new stand there would not be much danger after a day or two. But look out in taking bees from a queen and putting them on a new stand, that they do not desert the brood. It is safer always to form your nuclei of bees already queenless.

12. Generally a queen-cell will be received more readily than a queen. It will be a rare case that any colony will not receive a queen. This is a question of the bees and the worker's care.

This does not refer, however, to bees with laying workers; hard to get them to receive anything unless it be a virgin just out of the cell.

13. If you mean dividing into two parts—a thing that is of doubtful policy—you might set the two side by side on the old stand; then if one should get more bees than it should have you could move it away a few inches and bring up the other.

Langstroth on... The Honey Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for $1.25, or club it with the American Bee Journal for one year—both for $1.75; or, we will mail it to you as a premium for sending us THREE NEW subscribers to the Bee Journal for one year and $1.00.

GEORGE W. YORK & CO.
14 & 16 Erie Street, CHICAGO, ILL.

250 Poultry Pictures

Illustrating every phase of poultry raising and management. This is a practical book, with a profuse amount of practical and valuable information. It contains 250 large pictures and all the information necessary for the successful management of poultry. It is especially well adapted to the use of poultry raisers. The pictures are all large and well defined. The book contains also about the warranted for 10 years by the manufacturers, which is guaranteed to pay for any other book, or money re- fund, for life. The pictures are made of the best and most reliable materials. The book will be sent to you free of charge. For both 50 and 100, only 75 cents.

A HANDY TOOL-HOLDER!

Sent by Express, for $1.50; or with the Bee Journal one year—both for $2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grist-stone, should have one of these Tool-holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shaver or ax. Extra attachment for sharpening seyde blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. If wetted, it is just as easy to any size stone for hand or steam power. is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-holder. Pays for itself in a short time.

How to Use the Holder.

Directions.—The Tool is fastened securely in the Holder by a set-screw and can be ground to the desired level by inserting a pin up the handle of the Tool, which is longer than the desired length. While turning the tool with the right hand, the left rests on an steadies the Holder: the Tool is moved to the left, or left hand, or stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-End Tools, the blocks in the Standard are used instead of the notches.

The Emerson Binder.

This Emerson stuff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only $1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this “Emerson” so further binding is necessary.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

Mistake in “Averaging Up.”

On page 157, J. D. Gehring wonders if F. P. Gunzel’s report of 4,000 pounds from 94 colonies is not a mistake.” One thing is certain, as Mr. Gehring “figures it.” His 170 pounds average is a huge mistake. Would not 349 pounds (nearly) reduce the cause for wonderment? W. M. WRAY.

Bee-Keepers’ Society.

J. P. BLUNK.

Webster Co., Iowa, March 9.

[No, we don’t know anything about fishing, so if Mr. Hasty wants a companion, on such a job, he’d better take Mr. Blunk, who is a diligent student of the late, lamented Isaac Walton.—Editor.]

Mistake in “Wintered Well.”

I wintered 25 colonies in with-packed hives, and up to this date they seem to be lively and doing well. J. A. GOLDEN.

Morgan Co., Ohio, April 1.

Mistake in Mathematics.

In Mr. Getaz’s article, on page 151, a little mistake in mathematics appears, and should be corrected without any delay, because mistakes—according to an old maxim—are no haystacks, and a knowledge to carry 2,000 pounds of material, taking 50 pounds on a trip, to a place 500 yards distant, he will truly have to make 40 trips, but if going to a point from the place of deposit he will have to walk 1,000 yards to complete his trip; therefore, the man carrying 40 pounds on a trip will cover a total of 4,000 yards, and the one carrying 100 pounds will walk one-half the distance, or 20,000 yards. E. F. RENBACH.

Northampton Co., Pa., March 11.

Experience in Getting Subscribers.

The editor has said from time to time that any one could get at least one new subscriber, but we have tried every thing in this line that keeps bees, and sent in 16 names at one time for sample copies, but not one would part with his dollar for subscription, but let his bees rot with foul brood, and then say “Let them go; they don’t gather any honey, anyway, so they might as well be dead as...”
Short of Stores.

Bees in this community are scarce and stores, and the time is critical, but as peach-bloom is now on, with open and warm days, I hope they will pull through without much loss.

L. T. SHIRLEY, M. D.
Pickens Co., S. C., March 29.

Report for 1900—Other Matters.

I have only a small apiary—from 40 to 50 colonies. I have a farm to work on, and the hives are not sold as there is no market here for extracted.

I depend upon the local market and orders by mail. I like calling for comb honey. I disposed of 1,000 pounds of last season's crop in that way, at an average of about 13 cents per pound. I have put bees with weight and grade, and in packing I am careful to have each section clean, properly filled, and as good, or a little better, than the outside exhibition section. In that way I have secured a trade that takes all I can supply at one price. I have seen three and four cases in a light box or crate with hazy foundation in the bottom, and ship by freight, unless ordered otherwise, most points in North Dakota.

Last season was a fairly good one, my yield being 65 pounds of honey to the colony, and 30 percent comb. I make all my own hives, sections, etc. The hives are 14½×11 inches. Inside measure, with a 2½ inch hive. The sections are covered with paper or super; also rabbeted top and bottom to fit. The bottom-board is fastened to the hive with three hooks, one in the middle of the back, and one on either side near the cover. The front is flat, having 2½ inch cleats nailed to it. The cover has three battens at each side. The hives are 3½ inch by width of hive, regulated by a triangular block to suit sections. I have 3½ inch cleats increasing in size to fit the ends of each hive, and taking them out when placing in winter quarters.

I raise the cover slightly and put on the heavier covers with newspapers when placing on the summer stands, then remove the cover, making all tight and warm. I do not remove the paper until settled warm weather, and seldom lose a colony. I allow them to swarm naturally, and place the swarm on a tree in the spring, with newspapers and allowing it to remain two or three days, when I move it to another stand. I usually give them a frame of honeycomb of the same brood, placing it in the middle, and never have a swarm leave the new hive.

I had one new colony that cast a swarm the eleventh day, and don't understand it. I make my brood top-bars 1½ inch, split with a saw to within two inches of the ends. The ends are 1½ inches, with little pieces banded on the edge to serve as spacers. The bottom string, and the framework, is 1½ inch, to prevent the frame from touching the bottom. J. B. KNOWLES.

LARISE

To say to the readers of the Bee Journal that

DOOLITTLE...

has concluded to sell

QUEENS in their season

during 1918, at the follow-

ing low prices:

1 Untested Queen $1.00
2 Untested Queens 2.00
1 Tested Queen 3.00
3 Tested Queens 5.00
1 selected Tested Queen 1.00

Extra selected breeding the very best $1.00

Circular free, giving particular regarding each

class of Queens, conditions, etc. Address,

G. M. DOOLITTLE,

Borodino, Onondaga Co., N. Y.

$15.00 and $25.00 Queens

Having a Measured Tongue Reach.

The call for queens of our celebrated $200 imported mother

has been so great that we have decided, in addition to the $2.00,

$4.00, and $6.00 grades of this stock, to offer some $10.00, $15.00,

and even $25.00 of this same blood. But these prices are for tested

queens, the tongues of whose bees have been measured.

The $100.00 queen is guaranteed to produce bees with a tongue-

measurement of 19-100.

The $15.00 queen, 20-100.

The $25.00 queen, 21-100.

These last are very rare and with one exception this (21-100)

is the longest tongue reach yet secured. We reserve the right,

when we do not have the stock with the tongue reach called for,

either to return the money or to send the next lower, remitting

the balance. It would be well for our friends to put in their or-

ders at once, and as soon as we get the grades we will send notice.

When the money is sent, the queens will be forwarded. These

will be put up in the very best manner possible; and while we

guarantee safe arrival in good order to any point in the United

States, on any railway line, we will not guarantee safe intro-

duction. Such valuable queens should be releas on hatching

brood.

N. B.—It seems as if it ought not to be necessary to say that

not a queen-breeder or a large honey-producer should order

these high-priced queens: but it is a fact according to our expe-

rience that beginners with only a few colonies will order our high-

est priced imported queens. Such bee-keepers have no more use

for such queens than a pig has for a wheel-barrow.

Red Clover Queens

LONG-TONGUED BEES ARE DEMANDED NOW.

One Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year ($1.75); or, one Tested Queen free as a premium for sending us FOUR new subscribers (with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

Queens for these fine, "long-tongued" cells will be filled in rotation—"first come, first served"—beginning about June 19th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be cipt, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.

28 cents Cash paid for Beeswax. This is a good time to send in your Beeswax. We are paying 28 cents a pound and CASH—for best yellow, upon its receipt, or 30 cents in trade. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO.

Best White Alfalfa or Basswood Extracted Honey

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY......

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt.

Order the Above Honey and then Sell It.

We would suggest that those beekeepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO, III.
Freight Rate on Comb Honey.—On page 211 we called attention to the fact that the Western Classification Committee had before it a proposition to raise the freight rate on comb honey. We also urged that everybody interested should address a letter to Mr. J. T. Ripley, chairman of the Western Classification Committee, Room 604, Great Northern Building, Chicago, Ill., protesting against the proposed injustice. Among the responses to our editorial we have received the following from an Eastern commission firm:

GEORGE W. YORK & CO., Chicago, Ill.

Mr. Ripley,—We feel it incumbent upon us to express a strong desire that the rate on comb honey be fairly fixed. Hayward, who proposes to raise the rate, has not given us any reason to suppose that the present rate is inadequate to meet expenses. On the contrary, we believe that the present rate is too low. Moreover, any change in the rate of freight on comb honey should be made in consultation with the beekeepers as well as the railroads. The beekeeper is just as interested in keeping his honey as the railroad is in carrying it. Any change in the rate should not be made without consulting the beekeepers, who are the most interested parties. The rate should be raised in such a way as to reflect the increased cost of handling comb honey and not to penalize the beekeeper.

Sincerely yours,

[Signature]

BOSTON, April 6, 1901.

Blair, Scott & Lee.

In reply to the foregoing most excellent letter, we would say that we have already sent in our protest, as strong as could be made. What is necessary now is, that all the honey commission firms and comb honey shippers everywhere shall simply point in their letters vigorously protesting against the proposition to increase the present too-high freight-rate on comb honey. They should be mailed to Mr. Ripley as above directed.

What you should ask for is a rating of 1st Class—the present rating is 1½ times 1st Class. It should be lowered instead of raised.

The reasons we gave why lower rating should be made were these:

1. The business will not stand such rates. In bulk and value honey compares favorably with 1st Class articles. Under the provision of Rule 4, the carrier assumes no risk whatever for loss or damage. Covering the glass fronts, or parking in plain wooden boxes, would be no advantage, as the fact that the goods can be seen insures careful handling. Honey in plain wooden boxes will be thrown around roughly, the same as any other freight.

2. Other reasons will suggest themselves to our readers. Let us urge immediate action. Write at once—before you do another thing—if you wish to help prevent the enactment of an unjust ruling on the part of the railroads. Many protests coming from all sections of the country will have great weight with the Committee. Mr. Ripley will be in Washington, and are properly interested. Send them direct to him, and make them strong, but courteous.

Spraying During Bloom.—Green’s Fruit-Grower is one of the leading authorities on the subject to which it is devoted. In the March issue it gives some excellent suggestions on spraying fruit-trees, and urges that it be not done while in bloom. Here is what it says, and every bee-keeper should not only read it carefully, but see to it that his neighbors read it—better get your local newspapers to copy it:

SHELL WE SPRAY TREES WHEN IN BLOOM?

In the coming time, to insure success in fruit-growing the fruit-grower will be obliged to manage his orchard in accord with scientific principles. Perhaps farmers with little scientific knowledge will be able to manage an acre or two so as to produce all the fruit required for home consumption; but to grow fruit for market so as to be able to compete with those who grow fine, first-class fruit, he will be obliged to know enough of entomology to know what poisons to use to destroy the different species of insects, and also when to apply those poisons to effect greatest results, and at the same time do the least harm to the trees or fruits. He will also need to know enough of fungology to be able to combat the different kinds of remedies, when those remedies will be most effectual. As it happens, most of the insect enemies come into active life with the first warm days of spring. A few warm days will cause all the eggs in which the insects have past the winter to hatch, and the larvae, which have spent the winter in pupae, to leave their winter abodes and commence crawling over the tree or plant on which they have hatched. In search of the tender parts, which are their most appropriate food. The instinct of the maternal parent guides her to deposit her eggs close to suitable food for the young larvae. Hence we learn that some of the most formidable insect enemies of the fruit and turrit—the bad worm, the case-bearer, the apple-leaf folder, the leaf-crumpler, and several others a little less destructive, are ready to enter the opening bud and commence eating before it is fully expanded, and those very formidable enemies, the tent-caterpillar and the canker-worm, soon follow. There is no period in the life of those insects when they can be so easily destroyed by arsenical poisons as when they first begin to feed. A weak mixture of arsenic will then destroy them while a much stronger mixture may fail to do so when they have attained to larger growth. It is evident, then, that apple-trees should be sprayed with Paris green, or other forms of arsenic, when the buds first begin to swell, certainly when the leaves begin to unfold. As many kinds of fruit are to grow with the warm days of spring, Bordeaux mixture can be profitably mixt with the arsenical poison.

A few years ago, from a mistaken idea of the time when the codling-moth first lays her eggs, orchardists, learn that if they waited until the apple-blossoms fell it would be too late to destroy the larvae, sprayed their trees while in blossom, and bee-keepers complained that their bees were poisoned, and prevailed upon our Legislature to pass a law forbidding spraying while trees are in blossom. Many orchardists felt greatly aggrieved by this law, asserting that they were forbidden to spray just when spraying would do the most good, and that they must sacrifice their apple-crop upon their own land, for the benefit of the bee-keeper who had no claim upon their orchard as a bee-pasture. More recently, a careful observation of the habits of the codling-moth led to the discovery that she does not deposit her eggs immediately after the blossom falls, but several days after the blossom, placing them in the calyx, or blossom end of the fruit, as had always been supposed, she lays them upon the side of the young apple, gluing them to the rind, and that when the egg hatches the larve crawl over the fruit in search of a place of concealment, which they generally find in the partially closed calyx. This seems to show that there is no occasion for haste in spraying immediately after the blossoms fall, but...
that any time before the early closes will answer, when the little cup may be filled with the poisoned water ready to give the worm an hospitable welcome to its first meal.

Still more recent investigations show that it is not only not necessary but actually harmful to spray the colling-worm when the trees are in blossom, because it is a positive detriment to the fruit to spray at such a time. At the late meeting of the Western New York Horticultural Society, Prof. S. H. Strong, of the New York State Experiment Station, at Geneva, detailed some experiments he had made in spraying apple-trees, when in bloom, with Paris green. He experimented in two orchards in Ontario County, and two in Niagara County. Had sprayed some trees in all of the orchards and left others contiguous without spraying. All the trees were full of blossoms. On the trees sprayed, but few apples set, while a very large proportion of the blossoms fell, apparently, before the fruit set in, while on those not sprayed a very large crop of fruit grew. To make the test still more conclusive, he selected trees very full of blossoms, on one side, and sprayed them through to the other side, leaving the other side unsprayed. The result was, on those sides sprayed, the fruit set very sparingly, while on the opposite side, not sprayed, the trees heavy with fruit. Prof. Strong came to the conclusion that where you fairly hit an apple blossoms with Paris green strong enough to kill insects, you will pretty certainly kill the blossom. The organs of reproduction in fruit-blossoms, when fully exposed, are very tender and easily killed. A slight frost, or a long, cold rain, will often leave an orchard covered with blossoms, with little or no fruit. If these experiments shall be confirmed we shall confess that the Legislature "builted better than it knew" that while protecting the lives of the bees it prevented fruit-growers from destroying their fruit.

The foregoing would seem to annul the dangerous advice given by a certain manufacturer of spraying outfits who advises—yes—urges—fruit-growers to spray while their trees are in full bloom. The fruit-growers and bee-keepers should in some way unite in order to prevent the spreading of such harmful instructions as to the spraying of fruit-trees, and do all in their power to have the quoted paragraphs from Green's Fruit-Grower given a wide reading. It is not only in the interest of bee-keepers, but as much for the benefit of the fruit-growers themselves. There should be unity of effort between these two classes of people in order that each may win the best results.

**Beginning Bee-Keeping.**—We have lately received quite a number of letters from people who are contemplating embarking in the bee-business. And the questions they are asking are simply bewildering to a busy man.

Now, we don't object to being helpful along the line of furnishing all the information we possibly can to all enquirers, but we must be allowed to object when it comes to expecting us to sit down and copy out several times a day all that is found in the "A B C of Bee-Culture" and "Adventures on the Honey-Bee," and "The Bee-Keepers Guide." The best we can do is to advise the purchase of one or all of those three books, in connection with a year's subscription to the American Bee Journal, and then let the "other fellow" sit down and "drink in" all he wants.

Every one who intends keeping bees should first get a good supply of the best bee-literature to be had, and then be able to answer many of his own questions. Self-help is the best help. Each should by his own efforts inform himself as far as possible, then when he has exhausted his own resources, call upon others. First get and read a good bee-book thoroughly, then get the bees. Then read your book again. Then you will be ready for a good bee-paper, and, very likely, more bees.

**Finding Queens.**—Very a difficult and annoying procedure. Mr. D. H. Cogshall's method is thus described in the Bee-Keepers' Review:

"Fill a hive with empty combs, set it upon the stand of the colony containing the queen that is to be found, setting the colony to one side. Put a queen-excluding honey-board upon the top of that. Now take the combs, one at a time, from the colony, and shake the bees into the empty hive. The bees will at once run down upon the empty combs below, and the queen is easily found upon the top of the queen-excluding honey-board.

**Sowing Clove Seed.**—We have had several enquiries as to the sowing and growing of clove, or Rocky Mountain bee-plant. We have not ourselves experimented with this in all its beauty, but kindly furnish the information asked for, especially giving the time of sowing, the preparation of the ground, etc. Does it grow on dry soil, in wet land, and in what part of the season does it bloom? Does frost kill it when it is young? We shall be pleased to publish an article covering all the points in connection with this subject.

**The Premiums offered this week are well worth working for.** Look at them.

---

**The Weekly Budget.**

Mr. J. C. Wallenmeyer has been engaged to conduct the apiarist department of the Poultry, Bee and Fruit Journal.

Mr. C. P. Dadant was in attendance at the meeting of the Chi, cago Bee-Keepers' Association, held April 4th. It was one of the most successful meetings, both in numbers and interest, that the Association has yet had. And very much was due to the presence of Mr. Dadant. All united in the hope that he will come again.

Prof. J. C. York, principal of the high school at Girard, Ohio, writing us March 26th, said:

"I want to congratulate you upon the skill and taste you have displayed in adding improvement to improvement in the American Bee Journal. Personally, I think there is no magazine superior to the Journal of 1853 as the new Deering self-binders are superior to the old low-down that were in use about 18 years ago. I enjoy The Honey Circle."

Stenoo is accustomed to begin his department of "Pickings from Our Neighbors' Fields" in Gleanings in Bee-Culture with an original rhymical stanza. Lately he had this:

"Don't kill the pretty bumble-bees That hum around the barn; They'll bring the price of clover down, But ne'er a person harm!"

Stenoo certainly must have been sleeping in the barn on a cold night and suffered much harm from it, or he wouldn't be guilty of trying to make "barn" and "harm" rhyme. Now, if he'd had the bees humming around the barn it would have been all right—his stanza would have been less harmed.

We used to try to compose poetry, but it usually turned out to be such decomposed stuff that we long since have discontinued our efforts in that line. Shouldn't wonder if Stenoo would soon follow our good example, unless he reform, and treats the King's English more kindly than in the sample quoted above.

Mr. M. B. Holmes, of Ontario, Canada, is presented on our first page this week. Those of our readers who were present at the Buffalo convention in August, 1897, will recognize it as the picture of the eminent Canadian who contributed the valuable paper at that gathering, on "The Progress of Bee-Keeping in Canada."

Mr. Holmes, for many years, has been connected with the Ontario Bee-Keepers' Association, and that he enjoys the confidence and respect of the members of that great organization is proven by the fact that he has at times held the highest positions of honor within the gift of the Association. He takes a deep interest in all matters pertaining to bee-keepers, and readily responds to the demand of any project which will forward the interest of our industry.

The Ontario Bee-Keepers' Association made an exhibit of 48 tons of honey at the Colonial and Indian Exhibition in London, England, in 1896, Mr. Holmes' contribution to this exhibit being one and one-fourth tons.

Until a few years ago Mr. Holmes resided on his fine farm, but finding it not to be a very good place for a constitution not always the best, he rented his beautiful country home, and purchased a commodious brick residence in the beautiful and thriving village where he now resides, and has plenty of leisure time. He commenced bee-keeping in 1851.

It is always a pleasure to us to present to our readers portraits of the prominent bee-keepers among our Canadian cousins. They have some of the very best representatives of our pursuit over there. We shall never forget attending the National Convention held at Toronto, in 1885, where it was our good fortune to meet many of their number, such as J. B. Hall, Wm. McFoy, R. McKnight, F. A. Gouin, etc. They are all wide awake, and take a great interest in everything pertaining to the apicultural business.

On another page of this issue will be found the paper read by Mr. Holmes at the last meeting of the Ontario Bee-Keepers' Association.
Contributed Articles.

Saving Section-Combs From Foul-Brood Colonies.

BY WILLIAM M'EVOY.

LAST fall foul brood started in one of my out-apiaries. I had the affected colonies removed out of reach of the other bees, and then burned the frames and the hives. My apiaries are arranged for comb-honey production, and at the close of the season the superd, and all the supers were cut out and thrown away, and the foundation from the diseased apiary were piled in with the others, and now I don't know the one from the other.

I find that I have about 200 supers full of sections which contain empty combs, and combs partly filled with honey. Will you kindly tell me what to do with these supers, just as they have been taken off the hive, and ready for use, can be safely used the coming season without spreading the disease?—ILLINOIS, U. S.

In the honey season bees store honey in cells where foul-brood matter has dried down, just the same as they do in other empty cells, and when the bees, in making room for brood in times of honey-flows remove the unscaled honey out of the diseased cells, to partly filled with good honey in the sections above. It will mean as much at once.

If you had extracted the honey out of those sections and then placed them back on the foul-brood colonies, and left them there until the bees lick them out clean and dry, that would have made them perfectly safe to use on any colony of bees. But as the case now stands, you cannot place the sections that contain honey on your brood-chambers without spreading the disease, because some of the combs, when they are placed back in the hive, will have a little of the diseased honey in them, and the bees will feed some of it directly to the larvae as soon as you put them on.

It costs you something to buy these sections, and comb foundation, and it took some time to put the foundation into over 5,000 sections, and your bees added many dollars to their value when they drew out so much foundation into nice combs, and if you had to destroy the 200 supers and their honey, you will have lost a very fair share of your honey. Don't you need anything if you treat as follows: Take every section that has any honey in it, out of the supers, and bring them into a warm room, run the temperature up above summer heat, and leave them there until you can extract the honey out of them easily, then extract the honey out of every section, and after you have done this put all of these sections into supers by themselves. Then put frames with comb foundation starters into empty hives, and on these place queen cages and brood foundation sections, and in the honey season hive your swarms in these prepared empty hives with the extracted sections on where you will get them filled up and finish in the shortest possible time.

All the sections that you have with clean, dry combs in are perfectly safe to use on any of your old hives of bees. When the robbing season is over, and your bees are working nicely in fruit-bloom, take the combs out of the honey and store them in the apiary that was diseased, and hold them so the sun can shine into the bottom of the cells, and very carefully look for stain marks of foul brood on the lower side and bottom of the cells. Foul-brood matter glues itself fast to the lower side and bottom of the cells when it is drying down, and there it will remain just as long as the comb lasts, and such combs can not be made safe to use, but it is entirely different with clean, new, white combs that never had any brood in them. You may feel safe to use on any colony of bees after they have been licked out by the bees until they are clean and dry.

If you find a few cells with the stain marks of foul brood in any of your colonies (a thing you might easily overlook), treat supers, if they are from the honey-flow, but don't waste any time on empty hives that foul brood has been in, because they can not disease any colony of bees.

Woodburn, Ont., Canada.

Producing Extracted Honey—Getting More Of It.

BY G. DAVENPORT.

In order to understand how more surplus extracted honey, with less work and less swarming, can be secured here by the method I am about to describe, if only eight frames are allowed for a brood-nest, than can be when a larger number are used, it will be necessary for me briefly to describe a few things in regard to my locality, the most important of which is that in the spring, after the weather becomes warm enough for brood-rearing to progress rapidly, a queen is but from two to three weeks old when the white harvest commences. Eight frames are all or more than 90 percent of the queens can keep full of brood and eggs before clover bloom; afterwards thru June, July and August, a larger number of frames, with combs, are needed. It will be kept full of brood. But before this extra brood matures into field-bees, the battle has already been fought—like Blucher at Waterloo, they appear too late.

In a locality where the weather, or the time of the main flow, is such that a young queen can occupy a larger number of frames in time so that the brood will mature into field-bees to be of service during the harvest, it would, with many questions with their number of frames, not be necessary to put them to good use. Usually there is enough gathered from early spring until clover bloom to keep brood-rearing up. Strong colonies often secure more often than they can use for this purpose, but what is gathered for the table use, is needed. Now, with strong colonies run for extracted honey, instead of putting on the regular full-depth extracting combs, a set of shallow frames is given them to store this spring honey in, and what they do not use for brood-rearing, they will put into the frames that will collect and occupy these shallow combs almost as soon as they are placed on the hive. Often when the white flow commences these strong colonies will have hardly a pound of honey in the普通 storaged, the surplus will remain nearly full. But, as I have said, this is dark honey, and if it was in the regular extracting frames it would have to be extracted, or the first extracting of choice white clover honey would be so badly colored by it that it would sell for much if any more than half what pure clover would bring.

Now note this: By using this super of shallow combs, we save one extracting, and keep the brood-nest bare of stores. Here, just at or soon after the commencement of the main flow is the time strong colonies prepare to swarm, but when we remove this super containing all their stores, a full-depth story of empty combs is given. Zinc is placed between the two stories, or the wall is cut out, containing the most hatching brood are placed in the upper story, and a like number of empty combs from the upper story are placed in the center of the brood-nest below. A colony so treated will, with me, seldom offer to swarm, no matter how good the season is, provided they are given plenty of drawn comb to store all the nectar they can gather, for there is practically no honey in the brood-chamber at any time during the swarming season.

With 10-frame hives the case is different; the queen, as I have obtained, can never have more than eight of these frames, and the unoccupied space will always be filled with honey before the bees will store any in shallow frames overhead, and honey in the brood-chamber is a great factor to induce swarming. Frames taken out of the comb honey, can, of course, be removed to the upper story at the time it is set on. I have often done this, but it does not have the check on swarming that the entire removal of all old stores does. But I have found that each of these hives, even if the combs containing the most honey are entirely removed, swarming is more apt to occur than with 8 frames, for the reason that with 10 frames, storage in the brood-chamber is more apt to be commenced, or rather continued, if swarmed, and when it is a constant thing, the queen becomes crowded, then swarming is the natural outcome. Even when two full-depth stories are allowed for a brood-chamber, I have often found that the queen would come crowed enough to induce swarming unless a close watch was kept.

If one has time during the main flow to overhaul and extract from these large brood-chambers, swarming can be prevented. The queen is always left in the brood-chamber; the bees, if the queen is allowed access to all of them, but little swarming will take place. But when we come to extract from such at the end of the flow, the amount of surplus found after overhauling the whole outfit will be disappointing if compared with that is secured from colonies whose queens are confined to eight or ten frames.

By the use of these half-depth stories, I have been able to overcome most of the difficulties I found about producing extracted honey in a large way, first in regard to the dark surplus gathered in the spring. When the regular full-depth extracting frames were set on first, most of them had to be extracted before the white flow and with a large
number of colonies this would mean a good deal of work at a time when other important work connected with my research was going on. But the combs I have used, consisting of eight or ten frames, have been completed; and, besides, after extracting this dark honey there would enough remain in the combs to shade the first extracting of white honey so it would not be first-class. Then when the queens are confined to eight or ten frames I found that these colonies would almost always be too light in stores for winter, so that a good deal of feeding was necessary; but with the shallow frames I am able also largely to overcome the work of this, for my practice is to set these supers at the time they are removed, on colonies that are to be run for comb honey, then as soon as they get well started to storing in them, they are raised up and a super containing sections is put on next to the brood-chamber. While this is going on, the worker-combs, including the extracting frames is stored in the honey-house until after the white flow, when they are again, if not already full, placed on the colonies being run for extracted honey, in order to assist them full up during the fall flow. Then all the work about feeding these light colonies is to set on a super containing as many of these filled combs as seems necessary, and from experiments with feeding in this and a similar way with unfinish sections, I believe a colony will winter in a frame at a temperature of 45 or 50 degrees just as well with their stores in a super as they will if in the comb of the brood-chamber.

Through the spring I set some of these supers containing honey in the honey-house as soon as they were removed from the extracting colonies, the fore part of the season—but little of this was sealed, but it kept without grana- lations of nectar during the commencement of the fall flow.

The only trouble I have had about this plan is that the temperatures are liable to damage these shallow combs greatly during the time they are stored. In some manner the moth-eggs get in the combs while they are on the hives. Bi-sulphide of carbon will overcome this with but little work or expense, provided traces enough of the deadly fluid has not remain in the honey to make it unfit for winter stores. I expect to know something definite in regard to this soon, for last fall I subjected all the winter stores of five colonies to liquefying for four hours, which is, longer than is necessary to kill moth-worms and destroy the vitality of the eggs that may be in the combs at the time they are treated.

No. 2.—Drone-Bees and Their Utility.

Can We, and Shall We, Control their Production?

BY C. P. DADANT.

We have seen in a former article, why Nature has decreed the rearing of so many drones in each hive. It is in order that each young queen may readily find a mate at her first nuptial flight. We now will consider why some colonies build more drone-combs than others.

When a queen is young and healthy she lays plenty of worker-eggs and seems to prefer it, so if there is any understanding between the queen and her bees, the bees will, to please her, build mostly worker-comb. Thus a new swarm, with a strong and healthy young queen, will naturally begin by building all worker-combs. But if there is a lull in the crop and some of the brood hatches out of the comb already built, the queen will have plenty of room already and the few remaining combs will naturally be the first they are built. For tho' the queen prefers the worker-comb, we must take notice that the workers prefer to build drone-comb, for it is more quickly built and is just as good as the other to contain honey. It is evident from this reason as well as because they need the drone, that a queenless colony will build almost nothing but drone-comb, if we supply a new swarm with a large quantity of worker-comb already built, saved from diseased colonies of the previous season, or give this swarm only one or two empty frames, the result will almost invariably be drone-comb in those frames, for the queen has plenty of room to lay and the bees do not see the need of worker-combs.

In the same manner, if the crop is already well on, and the queen is getting tired of incessant laying of worker-eggs, and seeks for drone-combs as a rest, all or most of the comb will be drone-comb. In such instances a much greater proportion of drone-comb will be built. In early spring, before the bees have begun the busy season, and the hive is only partly full of brood, if at that time we supply a new swarm with an empty frame in the middle of the brood-nest, in a short time the comb will be of worker-combs, because the queen needs worker-combs in this warm spot, even tho' there may be plenty of worker-combs unoccupied at the outer edges of the hive. If the drone-comb is supplied it will soon be filled, for what is done in the warm of the honey crop, the result will be the reverse. In the statement of the foregoing conditions I do not wish to be understood as laying an iron law of nature. No act of Providence is ever to be expected, but the propositions above will prove correct in most instances. So if we wish to have the greatest possi- bility of having the supers full of comb honey, using comb foundation as a guide, we must, as uniformly as practicable, have the combs built by natural swarms, with young queens, and these swarms must not be supplied with a portion of their combs already built. In short, we must either supply the swarm with all combs built or with none.

Since the number of drone-cells in a hive depends very much upon the conditions of the swarm at the time that to lay eggs, which perhaps at the same time cool weather has an approximate idea of the number of drones that will be reared in an average season by an average colony. By looking thru a number of works on apiculture, I find that the approximate number of drones in an average season, has been variously estimated from one-tenth to one-thirtieth. There is no doubt that it varies a great deal. There is no doubt also that the difference in results is in favor of the colony containing few drones, and yet Chesh- brough, in his 'Queen Beekeeping,' says that in the colonies rear the most drones which have the best chances of self-reproduction, since not only their queen stands a better chance of mating, but the queens of other colonies are also inclined to mate with drones of the most prolific colonies, as they are most numerous. Is it advisable for us to control the production of drones in a hive?

Is the drone in the hive of use for other purposes than for the fertilization of young queens? Are the drones of one colony as good for breeding purposes as those of any other colony? If we decide upon the necessity of controlling the drones, is it best to destroy them after they are hatch, or while they are hatchng, or is it best to prevent their production? The first two of these questions would better be considered together, for it is the greater or less usefulness of the drones which will cause us to decide whether it is desirable to control their numbers. It has been asserted over and over again that the drone industry would be greatly increased if we only could prevent drones from appearing in our colonies. The action of the drone is to produce heat and to keep the brood warm in spring. Dzierzon and his English translator, Abbott, disagree on this subject. Dzierzon says in his 'Elements of Apiculture,' that the sole object of the drone is to fertilize young queens. As in the vegetable kingdom, pollen, on the male part of the flower, is produced in abundance, so does Nature produce an abundance of males in a colony of bees, in order that the queen, upon which the well-being of the colony depends, may be fertilized the sooner. It is obvious that drones were not also intended to produce heat in the hive, as has often been attributed to them, for when the young queen has been successfully fertilized and begun laying worker-eggs, there is no longer any necessity of drone brood, and the drones are then eaten by the other bees. By this time the hive has become filled with worker-eggs, and the drones cease to appear in any great number. Hence drones are there for other purposes than to assist in the fertilization of young queens. We have already seen that drones increase the heat in the hive, to keep it warm for the young brood. Also they are needed to assist in the working of the honey, which is the main object of the hive. These drones are also necessary to assistance in the process of nectar conversion, and the formation of honey. All these are important objects of drones. Let us not, then, lose sight of the importance of drones, while we consider the question of drone control. Evidently neither of these writers lays any value upon the drone as a warmth-producer at the beginning or the end of a season, and with good cause, for, in order that the colony should produce its maximum of income, the bees should be reared with expenditure of both labor and heat on the part of the worker-bees at a time when they are not numerous. And if in the place of, say, 2,000 drones, we should secure the same space of worker-brood, say 3,000 worker-bees, it is clear that they will not require any more
heat to be produced, and will in their turn produce as much as the drones would have furnished. Therefore, the only contention between the two writers, that needs any consideration, is whether or not the drones that remain after a colony has cast a swarm are of more use in keeping the hive warm than workers would be.

The contention of Abbott is that if they had been workers, they would have gone with the swarm, while being drones they stay in the hive. This is not altogether correct, for a colony with many drones shows many drones in its swarm. But perhaps more of them return home than of the workers. Yet, Dzierzdn, we must remember, is a great observer; he it was who discovered parthenogenesis in the queen-bee and we must be sure that he does not make statements without good cause, but perhaps the difference in observations comes from the difference in location. Dzierzdn experimented in Germany, while Abbott experimented in England, and there is but little doubt that the summer nights are cooler in Germany than in England, so this would explain Abbott’s regard for the possible use of the drones. Keeping the brood warm for a day or two after the casting of the swarm. I say a day or two, because we all know that at that time the bees are constantly hatching in great numbers, and it takes only a short time to recuperate the loss enough to keep the hive warm. In a colony that swarms, the daily hatch of worker-bees is between two and three thousand, sometimes more, and but little time is needed to recuperate the strength of the colony so as to enable it to take care of itself. Then let us suppose a colony with a minimum of drones. Is it very likely that this colony will actually suffer? Are such instances on record? And in domesticity, is it not entirely practicable for the apiarist, if a hive is left too bare of its bees, by the swarm, to mend this defect by returning a number of the bees to the old hive, after the swarm is hived? Surely, this one item of a possible use of thousand of idlers for a day or two for the sake of warmth, is not sufficient to justify their presence. They are the very ones that help induce the bees to warm early, by their noise every warm day, and by their encumbering presence on the combs at all other times.

So my conclusion would be that we should give but little attention to the possible use of drones for any but fertilizing purposes. If we can avoid the breeding of them, we must surely be well repaid by the additional number of workers that we can rear in their stead.

I will next consider the different methods of getting rid of the drones, or of preventing their being produced, and of making a selection of them for breeding purposes.

To be continued.

Mediterranean Flour-Moth Infesting Honey-Combs.

BY PROF. C. P. GILLETTE.

In the American Bee Journal for March 29, 1900, under the caption, “No Wax-moth in Colorado,” I said:

"But there is a smaller moth that is generally distributed over the country, commonly known as the Mediterranean flour-moth, which I have repeatedly seen infesting honey-comb. The larvae of this insect do not seem to care for wax or honey, but feed upon pollen, and perhaps propolis as well; ... and I have seen them in crated sections of comb honey."

I do not wish to change a word of the short item referred to, but as some fear that my statements might lead a careless reader to think that this insect is common in crated sections of honey from Colorado, I should like to say further that such is not at all the case. As stated above, this insect seems to care only for pollen, and possibly propolis, but not for wax or honey. I do not suppose it would ever be found in sections of crated honey except where the sections are kept for a time in the same building or room with old honey-combs that are infested with this insect. It is only in two or three cases of this sort that I have seen the larvae on sections of comb honey in sections. On one occasion I saw them in considerable numbers over a small number of sections, and on some of the sections they seemed to be feeding upon propolis which the bees had deposited in the corners in considerable quantity.

So this insect would only be of rare occurrence, at most, in section honey, and could no more be looked for from Colorado than from other States, as it is a generally distributed and a well-known pest in flourishing mills in this country.

To enable bee-keepers to recognize this insect and distinguish it from the old "wax-moth," I will refer them to the accompanying illustration (Fig. 1) from Insect Life, Vol. II, U. S. Dep. of Agr. The moth is shown at a and b, the larva at c and at the extreme right, and the pupa or chrysalis at d—all enlarged. The lines at the sides of the figures give the real lengths.

That these larvae can infest old combs badly is illustrated in the reproduction of a photograph of a frame of old comb that is nearly covered with their cocoons, shown at Fig. 2. This engraving is from Bulletin 47 of the Colorado Experiment Station.

Larimer Co., Colo.

Queens—The Best None Too Good.

Read at the convention of the Ontario Bee-Keepers’ Association at Niagara Falls, in December, 1900.

BY M. B. HOLMES.

As stated in the program of this convention, I am to give an address on the subject of "Queens" and it may be presumed that the punster, as he scans the list, will see his opportunity. If he be a sporting man he will at once suggest "The Queen of the Turf," or if he be a society man his thoughts will immediately become centered on "The queen of the party," force of habit and influence of association acting as a matter of course, as the promter behind the scene in these and other similar flights of fancy.

To this class of individuals, if such there be present, I have only to say, that this Association of practical men has convened in this city for purely practical purposes; that it is composed of individuals who are not speculative
merely, but operative in the strictest sense of the term: and that the only queens eligible for consideration at this stage of this regularly organized meeting of Canadian and American bee-keepers, are the queens of our colonies, and mothers of our most wonderful pets—the honey-bees.

The practical man, contemplating the advisability of entering upon the study of bee culture, naturally refuses to be deterred by the appearance of difficulties. He gpns the situation from every point of view, and, when fully convinced of its desirability as a lucrative venture, compiles most assiduously with all the conditions necessary to the complete success of the undertaking.

That all business men are not thus in calculation and execution, goes without saying, and it is also perhaps safe to infer that bee-keepers as a class are not without their failings as business men.

But every bee-keeper knows, or thinks he knows, all about queens, and yet it would seem, if some—perhaps too many—bee-keepers are satisfied by merely knowing that the queen lives in the hive, without any consideration as to her qualifications or ability for the duty which she is to perform. The splendid hives and comb foundations of the day are certainly a boon which every true bee-keeper appreciates, but the great center on which success most largely depends—that "center" at which no "master" bee-keeper can err—is in securing "the good queen" for every colony.

What do I mean by "the good queen"? By the use of the term "good," I mean, a queen that will do the largest amount of work in a given time.

The late Lorenzo Lorain Langstroth, who has been justly styled the Father of American Apiculture, describes a bee "beautish queen" in marvelous terms of his and "The Honey-Bees," as one that will lay 3,500 eggs per day for several weeks in succession during the breeding season.

What bee-keeper of any considerable experience has not had occasion to note the difference between good, medium, and poor queens? The colony with a hundred of bees, so to speak, gaining so rapidly in numerical strength as in some cases to exceed the more populous colony in the next hive, in the actual amount of surplus honey secured for the bee-keeper, is a proof that the good queen was in the colony which had wintered poorly, whereas the well-favored colony had only a medium or poor queen.

Dzierzon, the great German bee-keeper and scientist, says "Queens differ much as to the degree of their fertility." Mr. Langstroth notes an observation made while transferring bees, by counting the eggs dropped on a black cloth in 40 minutes, as the queens of four different colonies. The first queen dropped 61 eggs, the second 58, the third 23, and the fourth 20 eggs, in the stated time. This observation was made in the middle of April, and on July 15th the colony of the first queen was very poor, the second very good, and the third, with the fourth queeners were very strong. Now let us apply the result of this observation to practice and see how it would figure out:

Take, for instance, an apiary of 100 colonies, the average strength of which is, say, 80 pounds of extracted honey per colony. Let the owners of 80 colonies be poor, 50 average, and 25 strong, and then try to solve the problem as to how the average yield of 80 pounds per colony is obtained. The poor colonies will gather about half as much surplus honey as the 50 of average strength, or say 40 pounds each; then in order to get the average of 80 pounds per colony for the whole apiary the 25 strong colonies must gather 120 pounds of surplus honey each! Now, if we can observe the deduction of Mr. Langstroth, as already noted, the difference between the poor, average, and strong colonies, is attributable solely to the difference of queens, then we are forced to admit the mere act of mating the 25 poor queens has incurred an expense of 1,000 pounds per annum when compared with the average colonies, and 3,000 pounds when compared with the strong colonies, either of the immediate expense to pay for all the good queens required, and have a better consideration to be looked into. You may change the figures as you desire and the result will always show that the poor queens are heavy debtors, with no prospect of paying, and should under no circumstances be treated.

Keep the best, and only the best—the very best are the cheapest in the end—and an economy that prohibits the employing of the best queens is certainly a false economy. The owners of Ayrshire, Jersey, Holstein, or other stock, do not stop at merely knowing that their animals are thoroughbred. Their ambition is that each individual member of their herds shall be the very best of its kind; and should not bee-keepers study their own interests by copying the example of the stockmen in this regard? Yes, by all means.

One point more in this connection, and one which many bee-keepers scattered over the Province will do well to stop and ponder carefully, and that is of finding out whether the stockmen that find it pay, I mean, the member of the Provincial Association, which is studying and advancing their interests.

Bee-keepers in the remote parts of the Province, into whose hands the Government Report may fall, will please make a note of this, and remember at the same time that the Ontario Bee-Keepers' Association is studying to advance your interests, and, like the stockmen, you will study your own interests by communicating with the secretary, Mr. Wm. Cousie, of Streetsville, and secure membership in the Association which is trying to do you good.

In conclusion, I would say to those who have come expecting to hear a flowery dissertation on scientific queen-rearing; and to those who may have wished that their favorite kind or race of queens would get an advance in the address—if such has been your anticipation, I can only tender you my sympathy in your disappointment. I said at the outset that we had met for practical purposes, and I have endeavored to give you a plain practical talk on the topic assigned to me, and I hope my address and the discussion which will follow may prove a practical benefit, not only to those gathered in convention here, but to many of our fellows who are not privileged to take part with us.

Ontario, Canada.

*SICKNESS IN THE HOME.*

Conducted by Prof. A. J. Cook, Glenmont, Calif.

Our readers will wonder why the break in "The Home Circle," The cause is not far to seek. One of the links in our circle—Mr. A. J. Cook—is a member of a family that has never been able to meet its payments. Strange what a difference it makes in the home when sickness lays her heavy hand upon one of its members. My stomach, which has always been my weak member, became very much worse, and I feared worse than I know. I was forced to give up all the work I was doing for the Home Circle. I am now recovered, and I am able to do some more work. I would like to see my home circle get together and have a meeting of the officers. I am very much interested in the Home Circle, and I am sure that if the "Home Circle" to-day is made a little somber by hints and suggestions regarding health and nursing, I will be more than pardoned.

There is no doubt that we are all agreed as to the importance of every member of "The Home Circle" working with both sleeves rolled to the elbow to cure the best health and vigor. How to keep well, and be at our best physically, is a most important question. Our nation and people are making gigantic strides in a material way. Our agricultural activities have taken a stupendous leap, and we are rapidly distancing all the other great nations of the world. Britain is alarmed, and even phlegmatic Germany is aroused at the threatening prospect. Is there not to-day to be a strong defense of trade last year exceeded Germany's entire export trade? There is still very cheering. But all this implies new, fear excitement, and if this is to keep on, as it surely is, it behooves every one of us to study how we may keep our health away to the top, that our health may be the bulwark of our trade, and that we may keep our health away to the top, that our health may be the bulwark of our trade.

*HINTS ON KEEPING WELL.*

I wish, now, to give some hints in regard to keeping well, which I am sure may well be observed by us all.

In the first place, we should remember the motto of the successful business man—"Ontario must always be the best income." We may well remember Macawber's words to David Copperfield: "Annual income, 20 pounds; annual expenditure, nineteen-six; result, happiness. Annual income, 20
AMERICAN FREE SOUTHERN ARE THINK first from regularity children. I never...
**The Afterthought.**

The "Old Reliable" seen thru New and Unrivalled Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

---

**SWARMING ON TEN FRAMES.**

It is rather a surprising result to find more colonies on ten frames swarming than on eight frames; but I do not wish to cast any discredit on the experiment. Mr. Davenport does not claim it as a rule, to be found good in all years and all locations. The rationale of it seems to be that sometimes two more than an increase of population without which swarming would not have occurred. Page 150.

**MEASURING BEES' TONGUES.**

Wipe chap of beedom, don't you know you can not measure a man's tongue—not to mention the other half of animate nature, to which the bee belongs? A tongue is a thing with great capacity for rubbing round. Best understood not by what it measures, but by what it does. Thus we reflect on the words of Adrian Gotaz, page 140. Indeed it does seem to call for some explanation, how all the other members of the bee seem to be so unform, and tongues alone reported with such variation. I can very heartily second the suggestion that all measurements of a surgical character should be regarded as tentative to a certain extent—meaning dollars and cents, but not to be regarded as final, till confirmed by live bees of the same colony taking actual sweet out of an actual cavity. Something better than the old inclined plane and wire screen ought to heave in sight, to keep pace with the Twentieth Century. Too much depends upon keeping it level, and too many bees have to work at it, and work at it too long. Who'll give us a bunch of glass clover-tubes—or put two rectangular slips of glass together a twelfth of an inch apart holding honey between? The idea of the latter is that bees will quickly take the sweet out from all the edges as deep as they can reach, and leave things so as to be clearly measurable.

**THREE "AFTERTHINKLTS."**

A new edible for bees—and prohibition States—"cold water soux." Page 152.

Pretty bad score for house-apiary, 16 queens lost out of 26, and that in spite of vertical painting in strong colors. Page 153.

How about the bee-man who would let bumble蜂 into a wonder world 20,000 pounds of snowy sections from posies not in bloom yet? Counting unhatched? Chickens hardly "in it." Page 164.

A VERMONT COUNTY VS. CALIFORNIA.

And so in Vermont one county produces 3/4 of all the State product, and one forty-fourth as much as California produces. How much better to fish in a little brook where there are some fish than in a big, landscape-adorning river where there are next to none! Page 153.

**ANOTHER AFTERTHUGHT TRIPLET.**

Archer L. White's experiment indicates that the solar gets less than a third of the wax from old comb, in fact less than a third of what can be got by a better process. Page 159.

Two chrestomies sometimes better than one. When you trot out that aged honeycomb-honeycomb conversium tell 'em also that the man who isn't sold for once in his life is sold for his whole life. Page 153.

Spect the Vermonters mist it a little on the comb-building question. Plenty of fresh nectar from the fields is at least a little better for comb-building than it can ever be again after it is sealed once. Page 153.

**THREE QUEENS NEAR EACH OTHER.**

That three young queens should remain near each other some time without coming to a fight I do not consider so very strange. Perhaps they were cold. And I guess if Ginner's quaint bees (or the remains of them) did not consider themselves a colony at all—only as individuals, there because they knew not what else to do with themselves—and so paid no attention to the queens whatever. Page 156.

**CLIPPING SLIGHTLY FOR NEAR-BY MATING.**

I had supposed that clipping a young queen's wing slightly, to prevent her flying away so far to mate, was to some extent practical. Mr. J. M. Rankin's experience of 64 failures out of 65 is rather in the nature of an extinguisher on that way of controlling mating. Page 165.

**SCORING THE SCORE CARD.**

The score card on page 166 affords abundance to think of and talk about. I'd Carrie Nation the "honey-wine" the first thing. "Spects there is nothing else. All wines from fruit-juices. Name "honey-wine" would be used to cover vile inventions a grade below hard cider, and on a par with the barbarous drinks of the Philippines. They call their "honey-wine" in the Philippines. You must get drunk let's get drunk on something orthodox.

There seems to be a oversight in giving the single-case display the same pointing as the general display. We read, "Variety."

This is all right for the general display; but it is not at all desirable that a twelve-section case should contain twelve kinds of honey. Let "Variety" in that place be changed for "Uniformity," unless something more important is thought of.

I suppose "Purity" in the beeswax class means freedom from dirt. Any impurity of the adulteration sort ought to disqualify altogether. Might not a less ambiguous word than purity be found?

I doubt the propriety of putting in the style of observatory honey as a minor item toward a premium on a colony of bees. Let any style that shows the interior well suffice; and then let observatory hives have a premium all to themselves, if desirable.

Quietness of bees" is so point so important that we dislike to discard it yet at a fair. It is a very tough thing to judge with any sort of justice. One lot will be tolerably quiet, and another lot running wildly, from causes not much connected with the normal manners of the bees at home in the hive.

Personally, I should prefer to vice-versa the figures in "Quality 25, Attractiveness 50;" but perhaps the brethren will like it as well just as it is.

---

**Questions and Answers.**

**CONDUCTED BY**

DR. C. C. MILLER, Marenco, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail—Eine.)

Swarming Management.

I have two colonies of bees that are very strong at this time, but I would like to increase only to three colonies the coming season. As I know that both will swarm, and that early, what do you think of this way of handling them? Say if No. 1 swarms, hive the swarm, then remove No. 2 to a new stand and set the swarm on the old stand of No. 2. I think if this is done in the middle of the day, when a great many field-bees of No. 2 are out, they will return to the old place and enter help the new swarm by this, and will reduce the colony of No. 2, and will this not prevent the swarming of No. 2? PENN.

Answer—It may prevent the swarming of No. 2, but not certainly. It will certainly make the swarming of No. 2 later, if it does not prevent it.

Italianizing—Other Questions.

1. Would it be profitable to Italianize, where there are black bees within half a mile of my apiary?
2. Would you advise the use of full sheets of foundation?
3. Is light-brood foundation as good as the medium to use on wired frames?
4. Is the Simplicity hive as good as the dovetailed, in the production of comb honey?
5. Would you advise larger than an eight-frame hive for comb honey?
6. Would you advise the use of an observatory hive?
I have one which I made this winter, but I did not know whether it would pay me to buy the glass for it.

IOWA.

Answers.—1. Yes, even if they were only an eighth of a mile away. Even if you have nothing but hybrids it will be profitable.
2. Yes.
3. Yes, if the wiring is close enough. Try it a little carefully at first if you are not sure about it.
4. You would be likely to find no difference in the amount of honey, but the Simplicity is hardly so simple as the dovetailed. If you try the two side by side you will be likely to prefer the dovetailed.
5. For some the 8-frame may be best, and for some the larger. The 8-frame requires closer attention, and even with good attention you will be likely to have some colonies start their stores this winter.
6. There is no particular profit in an observatory hive, but it is a pleasant thing to be able to see the bees at work in one.

Seems to be Paralysis.

I mail you a box containing some dead bees. I have three colonies that are dying off very fast from some cause, and I think you can tell me what is the trouble. You will see some are shiny and black. One colony is dying, and is all shades and colors. They are misnamed queenless bees. I think the worst. The honey they wintered on wasn't the best, but I have five or six other colonies that seem all right. Would you better destroy the diseased colonies, or will they be all right when warm weather sets in? Do you think it is paralysis?

The bees of the colony from which I send you specimens do something like this: They will catch or bite all around certain ones of their number, and finally the one that receives such treatment will roll off the entrance-board on the ground, kick around and die; and at evening they will crowd upon the end of the hive and expire, from 15 to 25 and sometimes more a day. It doesn't seem to make any difference whether the days are warm or cold, and they will lift the wing and try to fly, but can't do it. On mashing them there is a thick yellow substance that washes out of the body. The ones that are well are carrying in pollen.

KANSAS.

Answer.—It seems to be a case of paralysis. Altho many cures have been offered, unfortunately nothing seems reliable. Fortunately it is not contagious, and it is quite possible that it will disappear of itself. The most you can do is to take good care of your bees, seeing that they are well furnish'd with stores and not allowed to become weak without uniting; and then hope for the best.

Wants to Start Again With Bees.

My bees all died with the cold last winter. I have a patent hive and the frames of comb in it are all right. If I had a queen would she live and hatch in it? How many bees would she need?

ONTARIO.

Answer.—A queen alone would be of no value, as she would hardly live 24 hours. With bees enough to cover two combs, she should make a fair start. You will find queens advertised in this journal.

Moving and Feeding Bees.

I bought an apiary, or a wreck of one, and wish to move it one mile. In that yard I find other empty hives not in use, and they are full of moths. Several colonies fail. This is a two-story house, and it is too high, and at other hives the bees grompt in heaps around the entrance. Others died of starvation and I think the balance are short in stores. They are pack'd, and I can not examine them at the present place, nor can I get to them to feed in the hives, neither can I use entrance-feeders.
1. Will I have to build them up before I can move them?
2. Is it safe to move them in their present condition?
3. Are they likely to consume what little honey they have during the excitement caused by moving?
4. How would you like this way of feeding? I would feed them in or near the yard, by taking a large wooden tray and laying gunny sacks in them. Over this I would pour enough feed so that they can sip all day. The next day I would do the same, but add more water, the next day still more water, and so on until it will all be well

ILLINOIS.

Answers.—1. The only trouble is that moving will excite them so as to make them consume more stores, in which case the moving would be the worse for a colony on the point of starvation; but if a colony is alive at all it will probably last long enough to be fed after moving.
2. I don't think it is, the weather is at all favorable. In freezing weather a very weak colony might be so demoralized by moving as to hasten its death.
3. That has already been hinted at; but even if they do take it all into their honey-sacs it will last them for a time long enough.
4. The plan will work very well if the weather is warm enough for bees to fly, and we ought to have that kind of weather now. But don't bring them down to pure water too rapidly.

Overboiling Sugar Candy for Winter Feeding.

On page 201 "Iowa" gives his experience with cakes of candy made of granulated sugar as winter feed for bees. My experience with candy as a winter feed is similar to his. Only a short time ago I examined some colonies with candy about a foot below the cluster; one colony was so nearly destitute of honey that none could be seen, and the bees had begun to die, and yet there was a large cake of candy on the frames, but the bees had not touch'd it. I melted the candy and gave to the bees of the hive to which it was attached. The bees had been so cold for the bees to take it, in this form I should have poured some quite warm water all over the cake of candy. Warm water will penetrate and soften the hardest candy very readily, and so makes it available for the use of the bees.

SUBSCRIBER.

Answer.—This suggests that such cases may not be so rare as I had supposed. Here is something that may throw a little light on the case. In the British Bee Journal I find the following: "The sample of candy sent is quite useless as bee-food, being hard as a stone. It has been over cooked, and may be truly described as a "hard-cake." May not overboiling be the solution of the problem?

Candied Honey in Brood-Combs—Spraying While in Bloom.

1. I have about 500 brood-frames full of combs and honey, that are in good shape, smooth and square. There is 1,000 or 1,200 pounds of honey in them. The trouble is they are three and four years old, and the honey cann'd be used. Will they do to use this season or will they be damaged? If not, what is the best way to dispose of them? They are all built on comb foundation.
2. Would you advise keeping bees in an orchard? It is about two-thirds grown. They do not get the sun much until about nine o'clock in the morning. They have plenty the rest of the time. I could give them the morning sun, but it would bring them within about five rods of the road. Would I be likely to have trouble?
3. I am in an apple section, and some orchardists are bound to spray when the trees are in full bloom. They did so last year within ten rods of my apiary. I talk with them, and they said they could spray when they liked, and that I could keep my bees at home. I brought the question of spraying before the farmers' institute, and proved to them that they injured their fruit, and that they laid themselves liable; but they have been told that before. I am a farmer myself, but at present I am in the bee-business.

NEW YORK.

Answers.—1. Sprinkle them with water and give them to the bees. If necessary, repeat the sprinkling.
2. It is not likely the shade will do any harm.
3. Send a dollar to the editor of this paper or to the general manager of the National Bee-Keepers' Association, so as to become a member of the Association, and the manager will furnish you information by which you can instruct your neighbor, and give you any assistance needed. Of course you may get along without joining the Association, but you'll get along better with it, and be helping others as well as yourself.
**FOR SALE**

100 COLONIES OF BLACK AND ITALIAN BEES at Rahmainn self-spacing frames, all in divided hives, full worker brood combs, and two supers with each hive—$2.00 per colony for the first, or $2.50 for 22 colonies. Address, F. GENT, Rockford, Minnesota.

**WANTED**

A woman, position as assistant to a apiary in Northern Illinois preferred. Address, ANNIE C. McNEAL, CRETE, ILL.

---

**DESKS FOR GENTLEMEN AND LADIES!**

These desks are made of quarter-sawn oak, first-class finish, well put together, and will please every purchaser. They are an ornament to any home, as well as being a useful necessity. Would make a fine gift for father, mother or sister.

**The Combination Desk and Book-Case**

is just the thing for a farmer or business man of any kind, to keep his private papers in, and for his books, etc. The drawers have locks, and there are a number of pigeon-holes inside of each of the desks shown herewith.

The low prices quoted are f.o.b. Chicago. Please write for free catalog. Address,

**The Royal Star Combination Game-Board Co.,**

773 to 779 Carroll Ave., CHICAGO, ILL.

**LADIES' DESK.**

Size, 40 in. high, 25 in. wide, 15 in. deep. Price, $2.85.

---

**MANUFACTURER OF BEE-HIVES**

Sections, Shipping-Cases—Everything used by bee-keepers. Orders filled promptly. We have the best shipping facilities in the world. You will save money by sending for our Price-List. Address, Miss Bee-Keepers' Supply Mfg. Co., Nicollet Island Power Bldg., MINNEAPOLIS, MINN.

---

**THE WHEEL OF TIME**

For all time! We make them in one type only, no extras, TO FIT ANY AXLE. Any height, any width, any size, they are either direct or counter wheel or half wheel with or without chains.

**Electric Wheel Co.**

Box 16, Quincy, ILL.

Please mention Bee Journal when writing.

---

**FOR SALE**

10 COLONIES OF BEES in eight-frame divided hives, at $1.25 per colony. My bees are healthy, there never having been any disease among them. Address, CHAS. SECKMAN, Shipping-point, LINCOLN, Salkill, Nebr.

---

**BULL-STONG!**

**PIG-TIGHT!**

An Illinois farmer said that after he had nailed 200 pieces of loose oak on the ground that he could not sweep any benefit from, because the fence around the field would not turn pigs. Figure the loss for yourself. He also said all this would have been saved if he had used the Griswold Wire Coiled Spring Fence, and the value could have been raised a long way towards paying out of the fence. With the Griswold Machine, my farmer and myself made it himself at the amount of the fence. Cattlefree for the asking. Address, W. G. GRISWOLD, box 20, Muncie, Ind.

white, snowy blossoms before the leaves appear, thus making itself very conspicuous even from quite a distance. The blossoms appear in April or May, depending upon the season and latitude and the purple, edible berries, in June. It is an indifferent honey-producing flower."—C. L. WALTON.

Wintere on the Summer Stands.

Last year was a poor year for honey in this locality, but we have a few colonies that the winter all right, on the summer stands.

We have an abundance of white clover, but there are very few bees kept in it. I can do without the American Bee Journal, as I have learned from it all that I know about bees. —Alnozo Grant.

Clark Co., Wash., March 18.

Report from a Young Bee-Keeper.

Our bees have wintered well and are in good condition for spring work. My father used to think this bee, he had the best of bees, but he has found that they can be improved upon. He bought three queens from a prominent queen dealer, and all have proved to be very good ones. The one of them was especially so, and that he had selected that one from which to raise queens and have over 70 queens, and all of one's was poor.

We secured a very poor honey-crop last season, but we are watching and hoping for a good crop this season. —Emma Barker (age 14).

Better Prices for Honey.

Will some one please tell me, as well as the rest of the readers of the Bee-Journal, how we can bring about a speedy combination of the bee-keepers so as to get a better price for our honey here in California, where honey is produced by the car-load—yes, even by the train-load? The population is not so great as in the East, where from 2 to 100 colonies of bees are kept, and where honey enough to supply the demand can not be secured. We are at the mercy of the jobbers, who are not disposed to "live and let live," but want all.

If joining the National Bee-Keepers' Association will help to rectify matters, I would like to know it; and, if so, I will do all in my power to promote the good of the National or any other association that will help us out.

Would it not be well for the National Association to have a set of by-laws printed and sent to all bee-keepers, and advocate combination. We see, and hear of, combinations formed every day with immense capital, and they succeed, so why couldn't we? If every bee-keeper would contribute $2.50 it is hard to estimate what the amount of capital would be. —C. C. Horne.

If you want the Bee-Book.

That covers the whole Agricultural Field more completely than any other publisher, send $1.25 to Prof. A. J. Cook, Claremont, Cal., owner of "Bee-Keeper's Guide."

Liberal Discounts to the Trade.

Gove City Rabbitry! Prince Leopold, Ivanhoe, Donovan Boy, and others, very fine American stock. Youngsters, 3 months, $3.00, or 2 for $5.00. For pedigree, write W. M. WHITNEY, Kaakakee Ill.

AMERICAN BEE JOURNAL

April 18, 1901

QUEENS!

Improved Golden and Leather-colored Italian Queens.

We have one of Root’s best long-tongued Red-Headed Beekeepers’ Queens, at $2.00 each. We are the only one in the South offering Queens (both Black and Red-Headed) for this price. The above breeders have been added to our already improved and tested wintering season. J. L. Gandy, of Humboldt, N.E., wrote us on Aug. 25th, 1901, saying that the colony having one of our queens had already stored over 400 pounds of honey (mostly comb), he states that he has reason to feel that our bees work on Red Clover, as they were the only kind in his locality and applied for the above breeders’ Queens.

A. J. Root’s folks say that our queens are extra fine, while the editor of the American Bee Journal tells us that he has good reports from our queens from time to time. We have files upon files of testimonials on our Queens.

After considering the above evidence, send us your order and we will forward them to you, postage prepaid.

H. G. QUIRIN, Parkertown, Ohio.

be, but I suppose at least $1,000,000. That would make a neat little "compleat." Our prospects are very fair for a partial crop of honey this year. C. F. STEVENS.

San Diego Co., Calif., March 23.

Drone of Ye Olden Time.

The practice of cutting out drone-combs is a new thing. Plato, who was born some 400 years before the Christian Era, in his "Republic," says: "A likely opportunity to the body—breed in every commonwealth disturbance. Therefore, a skillful physician and legislator, knowing the great importance of keeping bees, must take measures in advance, if possible, to prevent their presence, but should they make their appearance, he must have them cut out, as quickly as possible, along with the combs themselves.

The usage is interesting because it serves to show that the Greek bee-keepers of Plato’s day must have had some sort of a hive which enabled them to handle the combs. It also indicates that they knew a thing or two about keeping bees. Mr. Daudat, in his articles in the "Bee-Keeping and the cutting out of drone-combs, has the satisfaction of knowing that he is in line with ancient example and practice.

The winter has been favorable here for bees. All colonies, so far as heard from, have come through the winter in perfect condition. Likewise wintered my bees in Cincinnati. & Ohio, for they are on the summer stands for four years now, and have yet to lose my first colony. I fill the super with some golden honey for the winter north and west.

FRANK PARKER.

Better Prospects Than for Years.

Bees in this valley were rather backward at the beginning of the year, but now they are coming up very fast, and the prospects for a honey crop are better than they have been for years.

W. W. ROSS.

San Bernardino Co., Calif., March 19.

Flowers and Fruit-Trees Blooming in Florida.

In Florida it is not the "Hum of the Bees" which tells us that the flowers are open, but the hum of the bees in the yellow jasmine bloom. It is a very pretty vine, and I have seen the tops of young pines bending with the weight of its golden bloom. Lately I saw a beautiful vine clinging to the corbeille of a two-story house, and winding around it so as to shed its fragrant bloom on the surrounding air.

The titi is now in bloom, and its long, white racemes of tiny flowers are also very fragrant, and yield a honey so handsome to look at. Pachy and plum-trees are also beginning to bloom—the plum-trees are very white, and the peaches are a deep pink. While the weather is favorable they are alive with busy workers. Many pear-pearcees in this vicinity have died off this season, and all report it as the worst year for the pear—some of the most beautiful varieties are lost by it. The clusters of blooms on good pear-trees resemble those on the magnolias. I have counted 45 blossoms in one cluster. Bees gathered much pollen from pies and cedars.

The past winter has been cold, yet there has been no severe freezing. The tender growth of orange-trees was nip by frost on March 6th, but now the little blossoms show prettily among the shiny green leaves.

I saw a bee-keeper to-day who said that he’s bees were not doing well, as he had had too many cold winds. He had swarms last year on Feb. 20th, but he thinks it will be a

Good Report from Colorado.

Seven years ago I started in the bee-business with 2 colonies, which I bought for $10. Last spring those colonies were purchased by a friend for $4 per colony for them, but I refused it. My honey crop last year was 2,400 pounds of extracted honey and 2,300 pounds of comb. I sold the extracted honey at 75c per pound, or $180, and the comb honey for 11c, or $270.50, making a total of $457.50.

My increase last season was 30 colonies, but I lost 2 of these during the winter, so have only 28 now. The lowest average of honey secured, spring count, has been 40 pounds per colony, or 288 pounds of honey in the winter, the latter being the average last season.

A. WADDINGTON.

Otero Co., Colo., March 27.

Report from Minnesota.

Our bees have weathered well, with a loss of only one colony out of 124. Last year we got no honey and had to feed our bees, but we hope for better things this coming season.

My father is going to give me a colony this year, and I hope they will store plenty of honey so that I will not have to feed them. We use the Langstroth hives.

We wintered some of our bees outdoors past winter. We had 10 of these bees larger on the sides than the hives, and 4 inches higher, and raised the backs of the hives so that the moisture can run out. We have 20 colonies in the cellar which seem to be all right, but when we take them out they may be all wrong.

FRED BANKER (age 12).

Poor Prospects for the Coming Season.

I put 11 colonies into the cellar, and I think there are a great many of the bees dead.

I am very much interested in the American Bee Journal, but I think it is about all we will have to comfort us this summer in the bee line. If the spring is late there won't be a much change.

DURLEY WINNEBEGO Co., Wis., March 25.

Bees Wintered in Good Condition.

My 34 colonies of bees seem to be in good condition, and if we have warm weather for a week or two we can take them out of the cellar.

We had a good horse killed by lightning on March 21, and another horse killed on May 21, 1910. The luck we feel that we must have the American Bee Journal in order to carry on bee-keeping successfully.

W. H. HARTWELL.
St. Croix Co., Wis., March 25.

Bees Short of Winter Stores.

The roads here are in very bad condition, and the farmers are very short of the hay. The rain is a foot deep, and there is snow on top of that.

In February I look at some of my bees, and find that we have 57 colonies and 1 will be short of stores. Maple is in full bloom, but no bees are working.

I am afraid no comb honey in our market for a month. I keep the extracted on hand. Poult brood has cut my number down to 30 colonies.

NOLAN CO., Mo., March 28.

CONVENTION NOTICE.

Illinois—The spring meeting of the eastern division of the Northern Illinois Bee-Keepers' Association will be held at the residence of B. Kennedy, 7 miles southeast of Rockford, Ill., on Rural Route No. 5, and 1 mile north of New Market, near Rockford, Ill., on March 21, 1910.

The interested in bees are cordially invited to attend.

B. KENNEDY, Sec.

factured by the M. KUMPEL Co., of LaPorte, Ind. These honeycomb prices are the result of the rapid rise in prices of honey this season. These prices are for the combination of honey and comb, and the rates are:

1. Light, 76c per pound, or $7.96 per 100 pounds.
2. Medium, 78c per pound, or $8.16 per 100 pounds.
3. Dark, 80c per pound, or $8.36 per 100 pounds.
4. Extra dark, 82c per pound, or $8.56 per 100 pounds.

The prices for comb alone are:

1. Light, 60c per pound, or $6.30 per 100 pounds.
2. Medium, 62c per pound, or $6.50 per 100 pounds.
3. Dark, 64c per pound, or $6.70 per 100 pounds.
4. Extra dark, 66c per pound, or $6.90 per 100 pounds.

These prices are subject to change, and will be paid for honey by the M. KUMPEL Co., of LaPorte, Ind., and will be paid at the rate of 3 cents per pound for zero comb, and 6 cents per pound for comb with honey.

Bees wax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co, Ill.

$15.00 and $25.00 Queens

Having a Measured Tongue Reach.

The call for queens of our celebrated $200 imported mother has been so great that we have decided, in addition to the $2.00, $4.00, and $6.00 grades of this stock, to offer some $10.00, $15.00, and even $25.00 of this same blood. But these prices are for tested queens, the tongues of whose bees have been measured.

The $10.00 queen is guaranteed to produce bees with a tongue-measurement of 19-100.
The $15.00 queen, 20-100.
The $25.00 queen, 21-100.

These last are very rare and with one exception this (21-100) is the longest tongue reach yet secured. We reserve the right, when we do not have the stock with the tongue reach called for, either to return the money or to send the next lower, remitting the balance. It would be well for our friends to put in their orders at once, and as soon as we get the grades we will send notice. When the money is sent, the queens will be forwarded. These will be put up in the very best manner possible; and while we guarantee safe arrival in good order to any point in the United States, on any railroad line, we will not guarantee safe introduction. Such valuable queens should be releas on hatching brood.

N. B.—It seems as if it ought not to be necessary to say that no one but a queen-breeder or a large honey-producer should order these high-priced queens; but it is a fact according to our experience that beginners with only a few colonies will order our highest-priced imported queens. Such bee-keepers have no more use for such queens than a pig has for a wheel-barrow.

GEORGE W. YORK & CO. 144 & 146 Erie Street, CHICAGO, ILL. are headquarters for ROOT’S BEE-KEEPERS’ SUPPLIES IN CHICAGO. Send to them for their free Catalog.
MR. GHENNAJ KANDRATIEFF,
Editor of the Russian bee-paper,
"Wiestnik Inostrannoii Literatury Ptehlovodstva."
(See page 205.)
Weekly Budget.

T. F. Bingham, of Clare Co., Mich., wrote us April 18th that the bees in his region had wintered fairly well, his own having been in the cellar just five months.

****

Dr. C. C. Miller gave us a short call on Saturday, April 14th. He is looking and feeling much better, and after all my past worries, he said, "I feel 15 years younger than I did three months ago!" The good Doctor's many friends will join in the hope that he may continue to improve, and be spared many years to help make easier the paths of questioning bee-keepers, and if need be say, "I don't know.

****

Dr. A. B. Mason, writing us April 12th, had this to say about himself and his bees:

FRIEND YORK—It is four weeks this morning since I had a fall and broke two of my ribs below the left shoulder; the latter bruised my hip, and am still wearing "corsets." They do not allow me to lift as much as a palm of the ground. At times I have to "bully" time doing nothing. I will be ready for business again in a few days.

Our bees are well settled in the cellar, and in splendid condition. It has been too cold to put them out, but early this morning, with the mercury fifteen degrees, it looked as if they might be put out to-day, but now at 7 o'clock a.m., it is clouding up, and prospects are for a cool day. Yours very truly,

A. B. MASON.

We regret very much to learn of the Doctor's fall, but are not surprised that it should have resulted in broken bones, as he is "no small affair." When a "boy" of his size begins to drop, something has to give way when he strikes bottom. But all will hope for his speedy and complete recovery.

FIXED FOR CREDIBILITY TO A BOY IS

Fixed for Credibility to a Boy is an heading of an item dated at Washington, April 13th, in the Chicago Record-Herald, which reads as follows:

Prof. Frank Benton, of the Agricultural Department, was fined $10 by Police Judge Scott yesterday for his inhuman treatment of Frederick Hahn, an 8-year-old.

For some time Prof. Benton, who is in charge of the apiary at the Department of Agriculture, has been annoyed by boys throwing sticks and stones at the bees-hives. On last Friday he made a raid on the boys and caught young Hahn. Taking him by one arm and one leg, the Professor carried and dragged the struggling, screaming child to the hives.

"I'll give you enough bees," said the Professor, as he held the boy in front of one of the hives, "and I'll give him, if necessary, another stinger severely about the face and on the legs. As soon as he could get away the boy ran home, where he was treated by Dr. Richardson, under whose care he still remains. John Hahn, the boy's father, procured a warrant for the arrest of Prof. Benton, charging him with assault.

The boy still shows the effects of the stings. His face is badly swollen, and both is eyes are red, and he is still incapacitated from work for but 60 cents; or we will send it with the Bee Journal for one year—both for only $1.40. It is a fine thing to have the name of the Journal on the cover of the Journal, as fast as they are received. If you have this "Emerson"—so further binding is necessary.

The Emerson Binder.

This Emerson still-board Binder with cloth back and gold edges will bind from $1.00 to $2.00 for 200 sets; or we will send it with the Bee Journal for one year—both for only $1.40.

GEORGE W. YORK & CO.,
144 & 146 Erie Street,
CHICAGO, ILL.
“The Man Who Reads” is the man who succeeds,” is the first sentence of an editorial paragraph in the Bee-Keeper’s Review. To illustrate it, Mr. W. L. Cogswell, of New York State, is referred to. He employs quite a number of young men every season in his bee-keeping work with nearly 1,500 colonies, and he says that “the young man who did not read never amounted to much in his employ.” It was a true statement, and will apply in practically every calling in life.

The man who would succeed certainly must read. He must inform himself concerning every detail of his business. He must find out the principles by which others have won success, and then adapt them to his own use. No man lives unto himself,” as said. And that is also a hard fact. We are all dependent upon one another. Each needs the other’s help and encouragement, in order to do the best work. And by reading we gain not only helpful information, but a necessary enthusiasm. We thus learn how others have done successfully, and we feel that we can do as well if we make the effort.

Honey by the Pailful.—Mr. Thomas Slack, of Canada, tells in Gleanings in Bee-Culture, how he disposes of his crop of honey by the use of tin pails, selling direct to families. His price is $1.00 for eight pounds. He thinks that when a family buys a pailful of honey at a time they will not use it so sparingly as when getting only a single section or a small glass jar of it. That sounds reasonable. And he says he can sell more honey at eight pounds for $1.00 than at 10 cents a pound. No one would want to try to push the 10-cent price if the other is a success. He allows 10 cents for a returned pail.

Mr. Slack covers with his market wagon 31 miles in three directions each week in the summer. Liquid honey sells as ten to one for him as compared with candied.

“Keep More Bees” is the advice some of the leaders are giving “without charge” to those who have not made very much success at bee-keeping. The idea is that most bee-keepers have not been in the business in a sufficiently extensive way to make it pay. This may be true in many instances; in others, if the locality is not suitable for successful bee-keeping, it would simply be folly to “keep more bees.”

As a sample of what at least one bee-keeper is expecting to do in the expansion business the coming season, we may say that he has already contracted to furnish 12,000 pounds of comb honey at 16 cents per pound. He will send them by rail to a hundred miles from Chicago. We are not at liberty to mention his name, as we are not certain that he cares to have it published. However, what we have given will do no harm. He is buying bees “to beat the band,” and expects to have about 250 colonies, and all in one yard. He will have an expert bee-keeper take full charge of the bees, while he attends to other business that requires his attention.

Last year, we believe, this same bee-keeper averaged 100 pounds of comb honey to the colony, and had over 50 colonies in the yard. We will be able to report next fall how it has paid him to “keep more bees” this year.

There is quite a good demand for bees this spring, at least in this locality, and if any of our readers have them for sale at right prices, they should do well by offering them the advertising columns of the American Bee Journal.

Spring Care of Bees.—Editor Hill gives this paragraph in the April American Bee-Keeper, which should be read, and its suggestions followed, by every one who desires to make bee-keeping a success:

At no time of the year does skillful treatment and care of the bees yield so great a reward as that bestowed during the spring months. Avoid handling unnecessarily at all times, and under circumstances to do which the weather is cold. See that all colonies are provided with queens and ample stores. From the time the bees are in the hives the winter has left them, they will need the stores which they may have. Protect the hives in every possible way against the loss of heat. Under the number of cells laid by the queen up to the 15th day preceding the opening of the bloom from which the nectar is to be gathered, depends the bee-keeper’s success. All laid thereafter are at a loss to the honey-producer. Give the queen the benefit of every advantage you are able to bestow, in order that she may meet the honey-flow with an ample force of workers.

Testing Barrels for Honey.—In all probability wooden barrels will be used for holding honey, for many years to come. Altogether the tin can is fast becoming the more generally adopted package for shipping extracted honey, still there are localities and purposes which demand the barrel. So we say, every man to his liking or preference. Pres. N. E. France, of the Wisconsin State Bee-Keeper’s Association, is perhaps one of the best authorities for holding the name. He is a very candid man, and cannot be induced to use a can for honey. But he knows how to test a barrel before putting honey into it. At the convention in February he gave his method as follows, the Bee-Keeper’s Review furnishing the paragraph:

“Barrels may be tested as to whether they will leak by blowing or forcing air into a hole in the head; but there is a peculiar knack in doing this. One breath alone will not test the matter. Put the lips or mouth close upon the apertures, and blow in all the air that can be expelled from the lungs; draw in another breath thru the nostrils, still holding with the lips the pressure obtained by the first breath; blow in another breath; hold this and draw in another. Perhaps a part of the third breath may be forced into the barrel, but that is all about. Hold the pressure. If there is a leak, the pressure will soon run down, and the car may defeat the sound of the escaping air. If there is no leak, the pressure will remain: and upon removing the mouth the air will come out of the opening with quite a decided explosion.”

Done at the Right Time.—G. M. Doolittle, in the Progressive Bee-keeper, about doing things in the apiary at the right time:

Upon their being done at the right time depends the success of many of the operations necessary. Frequently the necessity is evident that all bee-keepers do not realize this. The wise man said in the Scriptures, “If a man write under inspiration, he is not to say anything that is not true.” Here is a season, and a time to every purpose under the heaven; and the bee was a preacher instead of an apologist, he could have done little better had he been the latter; for unless the manipulations and operations in the apiary are done at the right time, all will be lost in the proper season, our purposes, no matter how good, will fail of the desired success.

Weak Colonies in the Spring.—In the April Bee-Keeper’s Review Editor Hutchinson has this to say about the treatment of weak colonies in the spring:

Weak colonies are something that, it is almost universally agreed, are not worth fussing with in the spring. Ulling them does not seem to help matters much. Several times have I united two or three weak colonies into one in early spring, taking out the extra queens and selling them, only to find, a few days later, the newly formed colony no more populous than was one of the colonies that were used in its composition. I, then, would again unite two or three of these made-up-and-run-down again colonies, only to see them again reduced in numbers. I believe that once, when warm weather came, and the bees finally began to build up, I had the remains of eleven colonies all in one hive. There is something about this matter that I don’t exactly understand. Here are three weak colonies. We unite two of them. A week later it is difficult to say which is the colony that was made up from the two, and which is the one left to itself. See that your weak colonies have sufficient food, task them up snug and warm, and then let them alone—and that is good advice to follow with strong colonies.

The Necessary Bee-Supplies.—Have them on hand, all ready for use when wanted? It is very aggravating to be compelled to wait for the arrival of supplies when the bees are suffering on account of their delay.
GHENNADJ KANDRATIEFF.

As the present ambitious strides of Russia towards aggrandizement are drawing the attention of the civilized world, it may not be amiss to show what is being done by some of its inhabitants in more peaceable lines. War is surely not a sign of progress, but the quiet pursuit of gainful application to the cultivation of the growing science, which are followed only by civilized men. So on the first page we give the photograph of a leading Russian apiarist.

Mr. Gennadj Kandratieff was born February 8, 1834, on the serdentine estate of Szakino, ten versts (being 3,500 feet) from the city of Vrineschma, in the province of Kostroma. His father, a retired colonel, was then living at Szakino and was the "noble marshall" of the place. After an old soldier's time of suffering, he desired his son to embrace the same career, and sent him, at the age of only seven, to the military Corps Alexander, for children. From this, in 1844, little Kandratieff was sent to the Corps Paul, of the Cadets. In 1853 he was transferred to the Regiment Model for the study of cavalry service, and lastly, in 1854, he obtained the epaulet of an officer in the regiment of Cuirassiers of the Grand Duchess Helen Pavlovna.

During the Crimean campaign, Russia was short of officers, and a call was made for volunteers; among these Mr. Kandratieff was placed as a cavalry officer at Sebastopol; at the end of this campaign, after the close of the war, when it became possible for him to quit the military service, he obtained his discharge and gave himself up to his favorite occupation—music.

His talent, his exceptional ability, and his passion for music, had shown during his earliest infancy, and during his military education, while still a boy, he already led the choirs of the cadets in the church.

At length, after numerous difficulties, he succeeded in leaving Russia to go to Italy, the country of music and fine arts. There, during the first four years of his sojourn, he studied with zeal the Italian language, the Italian song, declamation, everything, in fact, which has any relation with scenic art. In 1856 he made his first appearance on the Italian stage, as a baritone, in the opera of Rossini—Semiramide. This "debut" was very brilliant, and showed that he was for four years engaged in twelve of the leading Italian theaters, upon whose stages he filled with great success several roles of his profuse repertoire.

His artistic career was triumphal, and on the first of September, 1864, he was called back to Russia, for an engagement with the Imperial theater of St. Petersburg. He remained there as a singer until 1872, after which time he was appointed general manager of the Imperial Opera, which he managed until September 1, 1900. While he was occupying this position, which required great knowledge, strength of character, coolness and presence of mind, these occupations disturbed his nervous system to such an extent that the doctors advised him to seek for a summer occupa-

tion that would compel him to remain all day in the air and sunshine. He had become a member of the Free Economic Imperial Society, and had made the acquaintance of the celebrated professor of chemistry of the University of St. Petersburg, the great apiarist, A. M. Boutleroff. The latter induced him to go into apiculture, and Kandratieff took such a taste for this pursuit that now a life without bees seems to him a life without aim and without interest.

In 1878, Kandratieff and Prof. Boutleroff, who had thus become quite intimate, being both members of the Apiarist Commission of the above-mentioned Imperial Society, were jointly possessed of a large apiary, on the shores of the Black Sea, not far from Souhomou-Cale, for the rearing and cultivation of bees after rational methods. They then began regular visits to this distant apiary. Mr. Kandratieff even now remembers when going on these trips which the Calé was seen in the Black Sea during the first three months of April and May, the best time of the year in Caucasus. They would go by rail to Sebastopol (still in ruins since the Crimean War), from there in a carriage to Salta, and thence on a steamer which stopped at all the ports on its way to Batum, whence they took another steamer for Souhomou-Cale. These voyages left with them interesting reminiscences and happy impressions.

After these pleasant and prosperous times the apiary was closed, and, in the same year Kandratieff lost his only son, who was feeble in health, and for whom he had hoped to create at Souhomou an earthly paradise; this section of the estate was therefore sold. After the boy's death the sale of the apiary was decided upon.

In 1886, Mr. A. Boutleroff founded the first Russian bee-

journal. After his death it was continued for many years by the celebrated Russian apiarist Zobareff, and later the editor's chair was offered to Mr. Kandratieff, who was able to accept for want of leisure.

In 1891 Kandratieff lost his only remaining child, a daughter. This was a heavy blow, and he completely lost his nightly sleep, finding rest only towards morning each day. To somewhat fill up the terrible vacancy in his life, he undertook, with his friend Izergine, the translation into Russian of the French edition of "The Hive and Honey-Bee," of Langstroth-Dadant. At the same time he elaborated a program for a new bee-journal. During each summer he took a trip to foreign countries and became acquainted with Metelli, Dubini, Visconti, Paglia, Barbieri, and Lambertenghi, in Italy; and returning by way of Switzerland he regularly visited Edward Bertrand, with whom he always found a hearty reception and many new ideas on bee-culture. Bertrand approved the idea of this third Russian bee-journal, and in 1892 they issued the first number of the "Messenger of Foreign Apiarian Literature"—Wiesnik Inostranny Lliteratury Pchelowodstva.

As is often the case when something new appears, the Messenger met many ill-disposed people who affirmed that foreign ideas are of no value to Russia, and that special methods must be created for that country, as if the Russian bees were not the same insect as the bees of other countries. But this was smoothed over everything; the idea of publishing the paper at the low price of one rouble (about 51 cents) and of printing it in all things that were new and worthy of notice in Europe in apiculture, proved to be excellent. The journal had great success; it is now very much read, and it has propagated the knowledge of bee-culture. Many pleasant acknowledgments are received from all parts of the Russian empire. Those letters written mostly by persons who have followed the advice given in that journal, express the hearty thanks of their writers for their leader and guide.

It is especially the Dadant hive and system which Kandratieff recommends in his magazine, showing its advantages over some of the so-called Russian systems of beekeepers who have their own systems. The result of his constant and indefatigable propaganda concerning this hive, and of the success obtained with it, has been its establishment as the hive the best liked and the most in vogue in Russia.

Kandratieff has put into the hands of his devoted friend, Izergine, for three years past, the management of the Messenger. He, however, continues to support the journal with his contributions. He has also translated into Russian the "Conduite Du Rucher" of Bertrand, and the pamphlet entitled "The Modified Dadant Hive," also by Bertrand, which is now in its third edition. He has in addition translated the "Memorandum" of the Italian Dubini, and the unedited "Letters of Huber." He has also published the Dubini pamphlet "Honey as Food and Medicine" [20,000 copies], and Prof. Zubarsky's, "The Medical Properties of Honey," the latter to the extent of 90,000 copies. Owing to the many displays of these two pamphlets they have been so scattered all over Russia that some honey-dealers give them away with the honey they sell.

It is all that has been said concerning this worthy bee-master. It goes without saying that the name of Kandratieff will remain connected with the transformation of bee-culture in Russia and its development by rational methods, and who we may mention that it is only recently that the Russian beekeepers have reached to the magnitude it used to have in ancient times when that country exported its bee-products to all countries of occidental Europe.

Queenie Jeanette is the title of a pretty song in short music size, written by J. C. Wallenstein and published by Mr. B. H. Ollendorff, keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

Better order at once, if you want a copy of this song.
Contributed Articles.

No. 3. - Practical Lessons for Beginners in Bee-Culture.

BY J. D. GEHRING.

(Continued from page 230.)

"WELL, Mr. Bond," I continued, "you notice there is a piece of heavy, strong muslin as a cover on the top of the super resting on the frames of the hive. That cover must be removed, and it will be necessary to get out into the space under the hive-cover and around the super. Of course, you understand, when there are two or more supers on a hive we put the cover on the topmost. I use muslin instead of oilecloth, because muslin lets the moisture and some of the surplus heat escape, and oilecloth does not."

"Now, before we can do anything inside the hive this super must be removed. I have seen bee-keepers who would first remove the supers cluster by cluster, I think, instead of getting to the super."

"I make the bees go down into the hive, but I don't do that because when driven down they are in the way."

"Well, I declare, if there isn't a swarm coming out yonder!"

With this exclamation I started on the run toward the hive casting the swarm, bidding Mr. Bond to follow me.

Arriving at the hive I stooped over and shoved the entrance-blocks toward each other, thus contracting the entrance-space, as Mr. Bond was of course curious to know why I did this, and I explained thus:"

"I do this in this case because I don't want the swarm to get out so fast—they were rolling out by the pint, you noticed. The object is this: As there is only a small space for the bees to come out thru, it makes the swarm a long time to get out, and those that are out first get tired flying around. The queen is usually out with the first Queen is usually out with the first swarm, so she gets down with the bees that are out, but, as she isn't used to much exercise, she is sooner tired out than the others, and, indeed, instead of waiting for the rest of the swarm, alights on a convenient branch of a bush or tree to rest, and the swarm clusters there, completely covering the queen. Thus then there is a large bee-space, however, the bees will all get out in about two minutes, and, being fresh on the wing, and excited, they will fly off in a body, sometimes quite a distance away, and then cluster away from the hive. There you need a long ladder and a rope and a saw, or an ax, to get them.

"Now, watch this swarm," I said to Mr. Bond. "You see they are flying around near the hive as tho they didn't know what to do. They do that because they are waiting for the rest of the swarm to join them. There they are, settling on that apple-tree, on a limb low down. Now, I'll show you how I hive a swarm of bees," I said to Mr. Bond, pronouncing the personal pronoun with strong emphasis, to remind him of his way.

"Now, Mr. Bond," I continued, "the first thing in order in this case is to move this brood-chamber far enough away to make room for the hive I'm going to put in its place. First, however, I open it and take the super off. It is nearly full of honey, so I would leave it on. You see I don't want the swarm to get out so fast, and when the bees come in from the field, would enter the old hive. But I don't want them there, but in the hive the swarm is in."

"But we must now hasten to get the new hive in order and provide in position where the old one stood. We can never know how long a swarm will stay where they settle. You see, this is not the usual time of day for bees to swarm. A swarm that will do one thing out of the usual order can't be trusted not to do something else that is unusual."

"Now," I said, when the new hive had been placed, "we will take a look inside and see that everything is in working order. This hive has eight frames in it, you see, every alternate one filled with three-quarter sheets of comb foundation. The others are empty, because, when the swarm is very large, like the one we are now dealing with, it completely fills the hive. In a short time it becomes so hot inside that, when there are such quantities of comb in each frame, and, of course, all of them, get so soft that they collapse to the bottom of the hive. But when only half of the frames are filled with foundation sheets the bees have more room and more air, and the accident mentioned doesn't happen. But now we will get that swarm."

The swarm was secured by standing upon a box, taking a firm hold of the small limb at the end of which most of the bees are. I then carefully held my little forked frame over the center of the cluster, and then cutting the limb off carefully with a large and very sharp pocket-knife. Great care had to be taken, of course, not to jar the limb in the act of cutting, and thus dislodge the cluster."

"I said to Mr. Bond, as I was yet standing upon the box with the limb in my hand, "as you are taking practical lessons in bee-keeping, suppose you take hold as near my hand as you can and carry these bees over to the hive. You needn't be afraid if they crawl on your hand, they won't sting you."

Mr. Bond did as requested, a little timidly, to be sure, but successfully. "Now just lay the limb down carefully in front of the close entrance to the entrance, and then watch them run in," I said.

"And do you suppose, that is all there is to it?" asked Mr. Bond, looking surprised, and, I thought, a little disappointed.

"By that you mean, I suppose, that there is much more to it. I'll show you how a cluster can be handled."

"Well, I have a much more simple and easy way than even this. But I will tell you about it some other time."

"There is an important secret, however, about this swarm which you may want to know before you can ever hive any more swarms in the way you learned of your father. I think if you examine all the hives standing around under trees and hedge fences on your farm you will discover that some of them can be handled in this way."

"When a swarm of bees issues from a hive, and the queen has selected a place, or location, for it to cluster, a lot of bees which we call a 'scouting party,' composed of a hundred or more, immediately leave the cluster to find a new home. This adventure is on a piece of timber-land where they look for, and usually find, a suitable cavity in a tree, which they examine and probe to clean out, if found large enough. This is known as a fact, because bee-hunters have been misled by such proceedings into believing that a bee-tree had been found.

"One such case occurred in the bee-hunting experience of a brother of mine. On looking up into a tree for signs of bees, he saw a large number flying in and out at a hole near the trunk, as the bees had gone into the hole of a colony. He then set to work to mark the tree as his property—or the bees, rather—by cutting the initials of his name and the date of the discovery in the bark of the tree. While thus engaged he suddenly heard a great noise of humming, as of a swarm of bees above him, and looking up he saw a large swarm in the act of entering the hollow in the tree.

"This, and like observations by experienced bee-men, has led to the theory of the 'scouting party,' and also to the belief that when these pioneers have the selected home about ready for occupation they either return to the swarm in a body, or else a detachment only goes back, to escort them to the new location. This is the opinion of some. Why a clustered swarm will sometimes very suddenly depart for the woods while the bee-keeper is actually engaged in hiving it. And, sometimes, such a swarm will leave a beautiful and well-furnished hive soon after being put there. I know this for a fact, because such a thing resembles a 'false entrance.'"

"But I can give you substantiating facts from my own experience:

"The day last year a neighbor a few blocks away sent word that a swarm of bees had settled on the limb of a peach-tree standing near his woodsland in the back yard, and that if I wanted it I should come and get it. Taking my bee-box, spade to pry out the wooden hive, and carry the bees home in, I went over to my neighbor's yard. The swarm was a large one, and hung over the wood-shed roof within easy reach. I took my box and climbed upon the roof, and, holding the open end to the shelter, I reached up to give the limb a shake when I heard, directly above my head, a loud buzzing noise as of a small swarm of bees."

April 25, 1901.

AMERICAN BEE JOURNAL
I was for the moment greatly puzzled, for the clustering bees had, up to this time, been very quiet, and none had taken wing. I was sure; but, looking upward, I saw flying about the top of the tree in an excited manner, what looked like a small swarm of bees.

“Well, sir, in much less time than it takes to tell it, that swarm of clustering bees detach themselves from the limb and were off, going like a cyclone toward the woods down your way.”

(To be continued.)

Criticisms and Suggestions about the Score-Card.

By Friedemann Greiner.

I HAVE had some anxiety in regard to what the score-card committee would hatch out, and I am pleased now to find the work of our worthy committee in the shape of the proposed score-card in all its details publish'd on page 160. I suppose the committee was aware how impossible it is to suit the notions of every one, and probably expected their work to be criticised. If I point out some features wherein a change might be an improvement I do so with due respect to the gentlemen of the committee.

On the “General Display” I find nothing whatever to change. It is all right.

In the “Single-case” entry, it seems to me too much importance is attached to “attractiveness,” giving it 50 points. This would be all right in the General display, but for single cases this entry is not necessary, and might at least be placed on an equal footing with “quality” and “quantity,” if not placed below them in importance. A display we expect to be as attractive as possible, but in a single-case exhibition the superiority of the honey itself should be the governing feature.

The “Bee-entry” paragraph needs, according to my ideas, the greatest modification of any. The committee has overlooked the fact that a colony of bees can not be considered of two or more other bees for exhibition, without it contains not only queen and workers, but also drones. The latter have, however, not received any consideration at all. The reason for this is not apparent. The drone is the largest, makes the most noise. He is not very modest, by any means, nor do I see how he is not wanted at all. I wonder the committee could overlook him. Can it be possible the committee gives him the slip purposely? Is not the drone of sufficient importance to deserve consideration? If two drones are offered for exhibition, without it contains not only queen and workers, but also drones. The latter have, however, not received any consideration at all.

In regard to beeswax there is some uncertainty as to color. It is not fully settled what the color of the wax should be, and it is left to the one acting as judge whether he would give preference to yellow wax or white. As the bees manufacture it, its color either be white; as we manufacture it, it is kind of creamy-yellow at its best; it would be in favor of yellow as the standard color.

Wax should also have a peculiar aromatic odor. Aroma should be taken into account when judging, and so should have a place on the score-card. I would reduce “color” and “purity” “—or a score-card—by five each, and place the gained 10 to the credit of “aroma.” True, a judge may act upon his own ideas, but it seems it would be advisable to take this point into consideration.

The Premium offered this week are well worth working for. Look at them.

Are Bees Necessary to the Complete Fertilization of the Bloom of Fruit-Trees?

By Thaddeus Smith.

The part that bees play in pollinating fruit-bloom is a subject that has been discussed at various times in the past, and is still made a prominent theme in some bee-papers, and in some of the discussions of bee-keepers' conventions. Claims are made to the effect that bees are necessary in order to insure a full crop of fruit but such claims are not substantiated by facts or any positive evidence to sustain them. Bees visit fruit-tree bloom for honey and pollen, and in so doing go from one flower to another and are rewarded by spreading the pollen which fertilizes the flower. It is a very pretty theory. Bees and flowers! Sounds somewhat poetical, you know. But it lacks the facts to sustain it. It has been asserted so often that the persons who assert it have developed minds that have not been without investigation, and the cry has been taken up and repeated by writers who know nothing practically about it. But some of our experiment stations and professors of a more scientific mind feel the necessity of having some positive proof of these often repeated assertions, and are making experiments to see if they can find that proof. A report of some of these experiments was recently made by Prof. Lowe to a New York convention of bee-keepers, and an account was given in an editorial in Cleary in Bee-Culture. Further I wish to refer to these experiments more in detail.

There has been some contention between fruit-growers and bee-keepers; the former having produced an ill-feeling between them, the fruit-growers contending that bees destroy grapes and other fruit by biting holes, and sucking out the juice, leaving the fruit to rot; while bee-keepers claimed that fruit-growers brought the bees away from their crops, that they are in bloom, thus poisoning their bees. These charges and countercharges have produced a bad feeling between the two classes in some sections, when in reality there is no conflicting interest. The fruit-growers are certain that their fruit-blooms, and particularly the area of bee-pasture that supplies the bees with more honey and pollen. Bee-keepers, with less show of reason, are now trying to convince the fruit-men that bees are of great benefit to them, by claiming that a full crop of fruit will not be had without the aid of bees to pollinate the bloom.

I have been both a bee-keeper and a fruit-grower for over 40 years, and have been an enthusiast in both occupations, and have given these matters of contention of the two classes a thorough and impartial investigation, and arrived at conclusions that I believe are just to both parties.

Some 15 or 20 years before the case of Utter vs. Utter was brought for trial in court, I had settled the matter by the process of spraying crops. I even overcame the objection of the bee-keepers. I had 30 acres of grapes, and over 40 colonies of bees, and the time came that I found the bees working upon the Delaware and other early grapes in great numbers. I approached the beekeeper and told him I was greatly perplexed and did not know what to do, and if they were the real culprits I would be compelled to give them up. I did not act hastily in the matter, but set about thoroughly to investigate the subject, and after two or three years I had solved the mystery. I discovered that birds— one bird in particular, the beautiful Baltimore oriole—first punctured the grapes, and the bees gathered only the wast- ing juices; and further experiments that bees accept perfectly ripe grapes or other fruits. I also find myself on the side of the bees in the case of spraying fruit-trees while in bloom. It is necessary to spray while in bloom; and not only that, but it is an injury to the blooming fruit. But when it comes to the claims of my bee-keeping friends, that no complete pollinating of fruit-bloom can take place without the intervention of bees, and conse- quently of a full crop of fruit, I must respectfully differ from them, because I see, year after year, both large and fine crops of fruit, of many varieties, raised without the intervention of bees, in fact where bees are entirely excluded from the bloom. It would be unfair to take the facts in me to doubt my own senses of sight and taste to believe that there was anything in such claims of bee-keepers. From my view the claim looks absurd, and I take the position that bees are not necessary to the complete pollinating of any kind of fruit, and I think I can prove it. Now “to the law and the testimony,” or rather to the facts that ought to convince any unprejudiced mind.

But first I wish to notice the experiments made by Prof.
Lowe and heretofore alluded to. These were made by enveloping trees and parts of trees in a hood made of sheeting, and then removing them while the trees were in bloom. The trees so sheeted were found to set much less fruit than those left in their natural condition. It would have been very unreasonable to have expected any other result from this experiment, for it was plain that the trees so sheeted were in a vitiated condition. The free circulation of the air was excluded. The vivifying rays of the sun, so necessary to the growth and development of the average plant life, was excluded, and light, the needful food for plants, was kept away, making the experiment an unnatural one. Nature provides most bountifully for the perfect normal development of fruit. The unnatural heat in that hood which, when the sun was shining upon it, without the circulation of air, was allowed to suffuse the tiny particles that destroys the delicate germ of reproduction, or prevented the grains of pollen from ripening sufficiently to perform its functions. The sun shining upon the outside of this hollow island-air in circulation within it, would produce an unnatural heat intense enough to injure the anodevelop pollens and pistils; and these conditions would render the experiment abortive. In keeping the bees and other insects out, the wind was also kept out, and this is the main cause of the unreliability of this experiment. No one will deny that the wind plays a most important part in pollening flowers not only of fruit-trees, but of all the vegetable kingdom, many of which are never visited by insects and are at the mercy of the wind. To keep the wind from these flowers and sets it in motion, and the invisible particles are wafted hither and thither by every breeze that blows, bringing some of these particles in contact with the pistils of the flowers. They are wonderfully invisible ways of causing them to produce fruit until the proper ripening of the species. The wind is Nature’s agent to disseminate pollen, and every experiment that excludes it is unreliable.

The All-wise God who made all things and provided for them on earth, and said that there should be seed-time and harvest as long as the world stands, did not leave the fulfillment of this promise to depend upon the uncertainty of bees and other insects, but chose a more universal and sure provision, important to the continuance of keeping up the vegetable kingdom—of producing fruit.

In some countries there are no bees, as in North America before the white men came, and there are now places in this country where there are no bees, and in many of the southern states circumstancse and surroundings are such that other insects can not do this work. It is in some of these places where there are no bees, to which I wish to call attention, and give some facts that will sustain my position.

There was an island in Lake Erie, and near by me are several smaller islands upon which no bees are kept, and they being six to ten miles by water from any place where there are bees, no bees ever visit them. These islands are all of different species of trees, and Middle Bass Island is just across the international boundary line between Canada and the United States, and is one of the largest of these islands where there are no bees, and the whole is devoted to successful fruit-culture. Upon this island lives a friend, George M. High, one of the most successful fruit-growers in the State of Ohio, who excels both in quality and quantity of his fruit; growing successfully nearly every variety of fruit that can be grown in this latitude. Several years ago I asked Mr. High to join me in investigations by making daily observations when his trees were in bloom, to see if they were visited by honey-bees and other insects, and to what extent by other insects, and we continued these observations with the deepest interest in the matter himself. His reports were that he had never seen a honey-bee in his orchard, saw a few bumble-bees but they were not enough to visit one fruit-tree in ten thousand; also saw a few small "other insects" on the bloom.

These observations have continued for several years with the same result. I visit Mr. High about twice a year—when fruit-trees are in bloom and when the fruit is ripe and gathered. I am always surprised at his results in the fruit-line. Their trees set fruit so abundantly that peaches and plums have always to be thinned out, and they have sure annual crops than any other place that I know of—all zoned trees. These facts are to me somewhat skeptical, and those who are most anxiously interested, to establish the contrary that bees are not necessary to pollinize the bloom of fruit-trees.

I am aware that I may be confronted with the assertion, or argument, if you choose so to call it, that other insects were or might have been the means of pollinating these island fruit-trees so perfectly. For argument’s sake I grant you that other insects did, but the abundant fruit and results prove that bees are unnecessary, as other insects can insure good crops of fruit without bees. So the advocates of the importance of bees do not get much comfort from this, but I deny that other insects did it, and I propose to prove it.

The first witness that I shall introduce is Mr. O. L. Hershoner, one of the witnesses who gave his evidence at the convention of the New York State Association of Bee-Keepers on the side of those who say that I propose to prove that bees were necessary to pollination, etc. I quote from the proceedings of that New York convention as reported in an editorial in Gleanings in Bee-Culture.

"When the professor [Lowe] was asked how much of this pollination was attributable to bees, he could not tell; but Mr. O. L. Hershoner in referring to a similar set of experiments made some years ago at the Michigan Agricultural College showed the same results, the bees were altogether unnecessary; he stated that the average fruit-tree was almost completely covered with bees; that at the time the average fruit-tree is in bloom it is too early in the spring for other insects to be of any value; in his opinion the covering of the limbs or the covering of the whole tree, as explained by Prof. Lowe, showed clearly that the bees, and they alone, did the mixing of the pollen."

Notice Mr. H’s evidence as to the fact that "it is too early in the spring for other insects to be of any value;" and this corresponds exactly with my observation when I visited Middle Bass Island, and with my own, made repeatedly, here on Pelee Island. When these three witnesses agree so well in their evidence, that "there are no insects except bees at the time of covering the limbs of Michigan fruit-tree in October and November" in pollination, then it ought to be sufficient to establish that fact beyond question, and put a quietus to the "other insect" theory.

As to Mr. H’s "opinion," or his conclusion from Mr. Lowe’s experiments on the island, and they alone, did the mixing of the pollen," I am willing to leave it for what it is worth, as from the facts already given it can not be worth much. He reminds me of some other evidence and conclusions that I read on this subject. This writer said that he knew the bees were of great benefit to fruit-growers because he had some pear-trees near his apiary, and the sides of the trees next to his bees bore a good crop of fruit while the opposite side bore scarcely any. Comparatively an unaccustomed amount of fruit.

There are a number of other points on this subject that I would like to notice, but fear that I am already too long. But I will say, if there are experimenters and professors who really desire to give this matter an impartial investigation, I should be pleased to have them come here, and I will take pleasure in doing all I can to aid them.

Pelee Island, Ontario, Canada.

Queens Only One Year Old for Comb Honey.

BY C. M. DOOLITTLE.

A correspondent writes as follows: I have decided that every colony that is intended to be run for comb honey during 1902 must contain a queen of this year’s rearing. I desire good queens, that is, those with unexceptionable qualities, and to keep up a reasonably high standard. Can I follow in order to produce the best results for a series of years? Please tell me the columns of the American Bee Journal.

In answering this, I must say I can not conceive what line of argument could have been used to bring the question to a decision that he would not allow a queen over a year old in his apiary, which was to be run for comb honey, and can not help thinking that when his experience accumulates he will be disposed to consider that the queen which are in their second year do fully as good work as younger ones, where the colony is worked for comb honey, and often are equally, good the third and fourth year. Those who have read the Canadian Bee Journal for February, 1901, and treasured up what is found there about queens, will have "a feast of good things" to revel in for some time to come, along this matter of queen-rearing. There, Mr. J. B. Hall, than whom are wiser and better informed on the subject, gives the figures for 1900 and 1901, and amongst a thousand results he gives this in February, 1901, and treasured up what is found there about queens, will have "a feast of good things" to revel in for some time to come, along this matter of queen-rearing. There, Mr. J. B. Hall, than whom are wiser and better informed on the subject, gives the figures for 1900 and 1901, and amongst a thousand results he gives this

"I want longevity in my bees; I want that first and foremost; that is why I don’t want to replace my queens every year, because if I do I must kill them, and I don’t know what to kill, if I keep them two or four years, and they have done good work for four years, wintered well
Questions and Answers.

CONDUCTED BY
DR. C. C. MILLER, Marengo, Ill.
(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail. — Editor.)

Getting Increase—Kind of Bees.

1. What is the best way to increase rapidly the number of colonies for a beginner? I have six strong and one weak colony that I shall have to feed. I am giving partly filled sections to this one now. I would like to increase to 60, but do not count on getting any surplus honey to sell. This is a fair location for honey. I had one strong colony that put 66 pounds of honey in sections; the other one did not do much but young mated queen and got natural swarms from it. The 4 will winter well. The honey bees are well balanced, but the queen is a cotton, soft maple, sugar maple, basswood, red and black raspberries in abundance, gooseberry, plum, apple, peach, cherry, and wild blackberries. The fall bloom is where we get most of our surplus, such as a bee collection, and made a surplus of our honey. You see I have a steady flow most of the summer, which is necessary for you to know in order to give your opinion.

I do not know what my bees are. I will Italianize the whole in a little while, or as soon as they begin flying well. I bought 3 queens released September 10th. I have 2, and I don't know which to keep. They have 5 bands, and one colony is the result of a hybrid. I have the others as daughters of a bee from the same source. The queen is the result of a hybrid. She is from a large flock of bees and has the same result.

2. Why is this kind of bees or honey bees so much better than the wild bees?

3. Could you tell me what breed mine are? They have 5 bands, are larger than Italians, and longer, are ugly, and rush about the hive as soon as opened, and sting anything that comes along quickly, and will only retreat before a cloud of smoke. In handling supers it keeps one using the smoker to do anything with them. They are good workers, and if they were gentle I would not change.

Michigan.

Answers.—1. If you do anything in the way of rapid increase the first thing is to get a text-book familiar with general principles and with the different ways of increasing thereein. My advice to a beginner desirous of increasing from 7 to 60 would be—don't. You might without such a great deal of trouble get 60 started, and then you might with less trouble have them dead before Christmas. The wiser plan will be not to set any such limit, but to work on safe ground and increase just what you can safely, whether it be to 16 or 60. Take the nucleus plan, and having done one or two of your original nuclei, draw from the others to build them up, but do not allow yourself in any case to draw from a colony so as to reduce it to less than four frames of brood. Then you can start others, and as fast as a nucleus becomes strong to try, or it can do its part toward helping, only keep in mind all the time that in drawing you must not reduce to less than four frames of brood. In this way you will not be caught with a lot of weaklings, but can close up any time when the weather threatens to close up. Of course, with such a long season as you seem to have you may be able to reach the goal you have set, but don't count on going beyond just what you can safely do.

2. Some colonies of one kind are best, and again some of another kind?

3. Very likely they are Italians, and very likely if you compare carefully with other bees of the same age, you will find them of the same size as other Italians. Some of the 5-banded Italians are reported as cross, and others as gentle.

Queen-Rearing in March.

March 24th my bees had a fine flight, it being the first warm day since the holidays. While watching them just at noon I saw a queen come out and fly away, but return in 15 or 20 minutes. This was repeated three or four times while I was watching them. The colony is strong in bees, and was working nicely carrying in pollen. Now, was that a young queen trying to mate? If so, why did the bees supercede the old queen so early when there are no drones? If the colony became queenless in the winter where did they get the egg to rear the queen? It has been so cold since that I can't look thrue the hive. It has been too cold for bees to fly ever since. I have been keeping bees since the spring of 1881, but this is something new to me.

Indiana.

Answer.—It may be that the young queen was reared last winter and failed to replace the mother, and she may yet be all right. At any rate such cases have been reported in which the queens turned out well.

Alfalfa Not Recommended for South Carolina.

I have about 30 colonies of bees at home, and an other farm 3 miles away, 5 to 6 colonies. The best clover for hay and also for bees. A friend of mine tells me that while he was in the distant West he noticed bees doing well on alfalfa, and says its hay quality surpasses all he knows of. But, of course, he knows nothing as to its being adapted to our climate. Will it do well here? Is it used to any extent by bees? How much per acre, and at what season can I with reasonable certainty sow the seed? Will the alfalfa grow wild? I think I have heard that bees may not look for help from alfalfa for two or three years after sowing.

South Carolina.

Answer.—As far cast as Illinois alfalfa will grow, but seems to be of no value for bees, altho in the States farther west it is one of the best honey-plants. It is not likely that it would be of any value in South Carolina. Sweet clover, alfalfa, and crimson clover, are the things for you to try.

When and How to Form Nuclei.

1. I have studied three bee-papers all the winter, besides several bee-books, but so many plans only confuse me. What time (please give month) and how shall I form nuclei for increase, so as not to increase with some surplus honey?

2. Will taking two frames of brood and bees before time for white clover weaken the colony so they will not store any honey?

1. I opened a hive the other day, and very much to my
Feeding Sorghum Molasses.

What would you say about feeding bees sorghum molasses (that is, molasses made from cane)? Do you think it is injurious to the bees?

I am keeping bees for another man, on shares. I just began last fall, but I have kept from one to five colonies of honey bees for five years. I have kept the honey bees for winter, but no clover at all, but the prospects are good for this year. Clover is coming on in fine shape. Bees are flying nearly every day, and are working on clover. I don't know what they get.

Missouri.

Answer.—It would not do to feed sorghum molasses for winter food, but when bees are flying daily in the spring they may be fed sorghum or anything else they will take that is not actually poisonous.

Inverting to Destroy Queen-Cells.

I have nearly decided to adopt the Heddon hive in my future plans for increase in the apiary, and I have seen it stated by Mr. Heddon that a sure way of destroying queen-cells in that hive is simply to invert the section and the bees will destroy all queen-cells. Can you tell me if it is a fact? Have you ever given the Heddon hive a trial? As hunting for queen-cells forms no inconsiderable part of a day's work in the apiary, a plan that will destroy those we do not want as easily as reported, is very desirable, if true. And as it is scarcely practicable with the suspended frame, I am ready to adopt an invertible hive if it will do for our business.

"RIP VAN WINKLE.

Answer.—A few years ago it was thought by some that inverting queen-cells would lead to their destruction by the bees, but after further trial the plan has been found to be altogether unreliable. I have never tried the Heddon hive.

Swarming.

1. When a prime swarm issues does the queen always come out about the last of all, and first when an after-swarm issues?

2. In swarming-time, when a colony seems to be about ready to swarm, how would it work to place a cage in front of the hive with a bee-escape from hive to cage, and another from the cage to another hive standing at one side with full sheets of foundation? And about the second day put a queen in the new hive, and leave them arranged in that way for several days? Would I succeed in running most of the workers from the old hive into the new? If so, would you accept the new queen and go to work all right? Would the queen and bees left in the old hive give up the idea of swarming?

Iowa.

Answer.—1. No fixed rule about it. The queen may be among the first or among the last in either case; but she is more likely to be among the last in a prime swarm and among the first in an after-swarm. I have had very little chance for observation, and am ready to be corrected.

2. Sorry to say I don't believe it would work at all; but having never tried it I may be mistaken. My guess would be that it would fail in each particular.

Beet-Sugar Factory's Effect on Bees.

I attended a beet-sugar meeting the other night, and in discussing the matter a man from Rockyford said that beekeepers would have to move their bees a mile or so from the factory, as acids and chemicals were used there that would kill the bees. It was not a bee-meeting, so I could not discuss this subject, but I would like to have you tell us thru the columns of the American Bee Journal whether or not this is true. It seems to me of great importance to beekeepers to go West.

Colorado.

Answer.—I don't know whether a beet-sugar factory is a bad thing for bees or not. Some beekeepers must be living within a mile of one of these factories; will they please tell us?

The "Old Reliable" Seen thru New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Tokoyo, O.

Extracting Honey.

Yes, sir-ee, Mr. Ailkin, propolis will go to the bottom where it can do no harm, but when it is burned. Burr and all sorts of scrapings with propolis in should go thru the solar extractor the first thing. Then, as after transactions, remelt the wax, if necessary, and re-treat the waste cake. And—another yes, sir—-the stubbornness with which cold comb honey refuses to take heat is quite incomprehensible to the beginner in bee-practice.

Sometimes when in a hurry one can run the combs thru the extractor and throw out part of the honey, then hang them up in a warm atmosphere and pour or two, then run them thru again. But don't hang the combs very close together, even if three-fourths empty. The idea of a large gravitating tank with chance to heat it underneath is an important idea. Two such tanks, so one could be undisturbed while the other was being filled, would seem to be the ideal arrangement. And the whole article on page 167 is one of the very best Mr. Ailkin has given us.

Quelling Robber-Bees with Gunpowder.

And sometimes civilization does get forward.

Upon way,

We know that; but most of us never thought of civilizing robber-bees with gunpowder. No doubt it would "hiss 'em" if the charge was big enough. And any very offensive smell may discourage them if they are only fussing around and not getting much. Some brother who has a too-closeted hat, present it to Peacemaker as a premium for his contribution. Page 175.

That Generous Dog and Bee-Things.

That was an all-right and head-level sort of dog, on page 175, that wanted to share with his young master the bliss of communion withumble-bees. Masters like the aforesaid should not object to tasting of dishes which they have cooked.

Dollar-A-Pound Honey—Excluding Bees.

Honey at a dollar a pound is rather dear. But health and fun at a dollar a pound—well, most of us would fain purchase a little occasionally. So let Mr. Metcalf go on hunting the dollar-a-pound wild honey. Page 180.

So Chicago can get along nicely without a bee-exclusion.
The Home Circle.

Conducted by Prof. A. J. Cook, Claremont, Calif.

SUNSHINE IN THE HOME.

How few of us understand what sunshine has done for the world. Except for the blessed beams which come with their warmth of light, we could have no vegetable growth. The plants need the sunlight to change the carbon dioxide which they inhale from the air, and the water which comes up to them from the roots into the starch, sugar and oils which are to nourish them and to feed their tissues. Indeed, we owe to the sunshine the great coal-beds which make us so rich as a nation, and which, of themselves, contribute so largely to the comfort of so many of our home circles.

Sunshine in the home is as great a factor in supplying its best fruits as it is in the world about us in building up the great plant portion of the earth. Some years since, a man by the name of Alexis St. Martin, received a wound which over the upper part of his abdomen. The healing was imperfect and left a flap which opened into the stomach. Thus, there was formed a sort of a door so that any observer could not only look into the stomach and see its condition but could also reach in and withdraw the injesta so as to note any time the just condition of digestion. Some very interesting facts were observed. St. Martin was taken around to various of the medical colleges that the students might have the benefit of direct observation regarding digestion. Students are not always considerate and thus St. Martin was often vexed by them. At times he became very irritable and peevish. With an irritable temper outward impressions that it was very easy to affect his temper. He would either angry or happy at the will of those who held him in charge. It was found that if he was seriously irritated, immediately after eating a full meal, that the stomach remained pallid, showing that the circulation was held in abeyance, the gastric juice or digestive fluid failed to appear in the stomach, and thus there was an almost total failure of the food to digest. On the other hand, if he was in merry mood, the stomach flushed up as the blood coursthr up the capillary circulation, the digestive juices were poured out generously, and the food was soon liquified, absorbed into the blood, and hastened on to the tissues to help in the work of assimilation.

Here, then, we had a very graphic illustration of what many of us have proved in our own experience. How often has the letter bearing sad tidings, or the evil news told to us just after meal-taking, seemed to stop entirely the wheels of digestion. Often the stomach is said to be of the stomach, to be a machine as to give a fatal shock to the system. It is now a well-known physiological fact that anything which disturbs the mind is a serious break upon all the bodily functions. When the digestive system is made to work more slowly, the lungs fill less frequently, all the secretions are poured out with languor, and the whole body seems to call a halt. It is no wonder, then, that so important a part of our functional activities as that of digestion should be made by one of the most ready respondents to this evil effect of bad news.

We see, then, how important it is, if we would maintain health, that we should bring great floods of sunshine into the home, and should keep from it everything that incites worry or brings displeasure.

It is specially desirable that this matter of sunshine should never be lost sight of at meal-time. Anything that makes the table look more beautiful, as the neat and orderly arrangement of dishes and viands, or the vase of flowers, contributes not only to good digestion but as surely to good health. A long life and a full life in which the victuals may be more thoroly masticated and digestion hastened. This is certainly excellent advice. But the long sitting at the table, and the happy disposition of each person in an atmosphere of sunshine, which is the result of a happy hour of meal-taking, an hour so full of glee that it will brighten all the other hours of the day, is doing more than they know to keep dread disease from the household. It is shaming to see how this is neglected in the name of some thing to that effect. I wish I could say something in these talks on the home circle to brighten all the homes of the land, for I would in so doing add not only greatly to the health and vigor of all our readers, but would also do very much to make the world's life much more effective.

There is another consideration in reference to this matter which is well worth our thought. Discomfort in itself is very apt to breed the sullen disposition and the irritable temper. From what I have said above, these induce dyspepsia and ill-health of the house further the sickness of the sick, and it is again to impede digestion, and thus we have a fearful compound interest which will almost require a miracle to prevent serious disaster.

We have here it said that worry hurts worse and kills more than does work. This is certainly true, and is easily explained from what has been said above. Surely, then, if we do not make our own to flood the home circle with sunshine, brighten the sunshine, they are not only losing a full act, and the owing sympathy, but not only take a forecast of heaven in our homes, but they tend more than anything else to fence off disease and sickness, and to carry youth into old age. If we could do anything to secure such homes everywhere in our country, we would do that which would be greater with promise for the future of our good land than does even the wondrous prosperity which I referred to in my last article. A country full of bright, sunny homes would also be great in patriotism, and would ever be invincible against any foe that might dare to cross its borders.

NURSING IN THE HOME.

I am also minded to say a few words regarding nursing. One has only to be sick and in bed a few days to appreciate the kind of indications of the loving hands and hearts that do so much to rob even sickness of its terrors, and so much to drive the unwelcome visitor away. It is often said, and I am sure with entire truth, that of the, of the two, the good nurse is of more importance than any part of the medical care. For a certainty that medicine at the best is only a minor aid in the work of recovering lost health. Very likely many times the medicine does more harm than good. We cannot say the same of the good, thoughtful nurse. I have often thought that were it a girl or young woman, and time would permit, she should take the training necessary to make a first-class nurse even tho I might never wish to make nursing a profession. It is certainly well for every young woman to be fortified by having some business in which case of need would make her independent. There are a few things that woman is preeminently qualified to do. She alone can make the beautiful home; she alone can attain highest excellence in teaching children; she alone can make the hospital a place of rest for the sick. The good musician, so, too, the good nurse, wherever her lot may be cast, will never find her skill and ability beggining opportunities to make themselves felt and useful.

The first thing the good nurse will look to is such thoughtful and pleasant attention that the patient will have even the slightest worry over the closing of a window, the neatness of the room, the taking of medicine, etc. Every need and requirement will be foreseen and met with such promptness that the patient will have no worry at all and below the house generally in case where the nerves are involved, will be insisted upon by the good nurse. Inquiring friends will be courteously thanked for their thoughtfulness in calling and the hope express that the sick one will be able very soon to see them. There is no question but the sick one in the highest degree comfortable. Shaking up of the pillows, frequent arrangement of the bed-clothes, and the off-repeated bathing of the face and hands, especially in the case of fevers, will never be omitted. Perhaps the most important thing of all, and we may say the hardest thing, for the nurse is apt to become very tired and sleepy, is that she
Langstroth on... 
The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for $1.25, or club it with the American Bee Journal for one year—both for $1.75; or, we will mail it as a premium for sending THREE NEW subscribers to the Bee Journal for one year, with $3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.
144 & 146 Erie Street, CHICAGO, ILL.

The Bee-Keeper's Guide; Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK

460 Pages—18th (1899) Edition—18th Thousand—$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published. It is fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER’S GUIDE.

This 16th and latest edition of Prof. Cook’s magnificent book of 460 pages, is neat and substantial cloth binding, we propose to send to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with $2.00, and we will mail you a copy of Prof. Cook’s book FREE as a premium. Prof. Cook’s book alone sent for $2.25, or we will club it with the Bee Journal for a year—both for only $1.75. But surely anybody can get only TWO new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. WILL YOU have one?

GEORGE W. YORK & CO.
144 & 146 Erie Street, CHICAGO, ILL.

The RUMELY

TRACTON

ENGINES

Should you be needing the best thing in traction engines, portable and semi-portable, we have just the thing that will be your helper for threshing, drilling wells, cutting and grinding feed, running water, or doing anything requiring power. We have them from 8 to 20 HP.

They all excel as easy, quiet engines, require little fuel, remarkable strength, simplicity and durability. All built with precision and care, the economical and thrifty power house surrounded with water. Made also Threshers, Horse Pumps and Saw Mills. All fully described in our illustrated catalogue.

Ask for it. Mail-free.

M. RUMELY CO., LA PORTE, IND.

Please mention Bee Journal when writing Catnip Seed Free!

We have a small quantity of Catnip Seed which we wish to offer our readers. Some consider catnip one of the greatest of honey-yielders. We will mail to one of our regular subscribers one ounce of the seed for sending us one new subscriber to the American Bee Journal for a year with $1.00; or, we will mail to any one an ounce of the seed and the American Bee Journal one year—both for $1.30; or will mail an ounce of the seed alone for 50 cents. As our stock of this seed is very small, better order soon.

GEORGE W. YORK & CO.
144 & 146 Erie Street, CHICAGO, ILL.
Bringing in Pollen—White Clover.

My bees are still packing as for winter, but I think I shall unpack them soon. They were bringing in pollen on Easter Sunday for the first time in the new colony. White Clover has come thru the winter in fine condition, and I look for a good honey-year. 

J. J. STALNAKER.
Hardin Co., Iowa, April 10.

Cause of Bees Dying.

In the answer to West Virginia on page 201 Dr. Miller says, "It is painful to say I don't know." I would like to suggest that the variable temperature combined with inferior stores and the long confinement may have something to do with the matter. The mercury ranged from zero to 40 degrees above, several times within one week during the past winter. My bees completed the hives and the tops of the frames the worst I have ever known them to do in my 20 years of bee-keeping.

Braxton Co., W. Va., April 5.

Loss 15 per Cent—Death of a War Veteran.

My bees are not wintering in good condition. My loss will be about 15 percent, all owing to the fact that I was not thorough in preparing them for winter. We had sickness in our stock at the time, and the bees were not long hived as well as they should have been. We laid my father away to rest on March 25th, after having suffered for over a year with progressive paralysis. He was a war veteran, belonging to Company B, 73d New York Volunteers.

CARSON VA. BLAUCHUM.

Wintered Well.

I took my bees out of the cellar yesterday morning and they had a good flight of put 41 colonies into the cellar last fall, and was lucky enough to take out 40 yesterday, which beats my record the two years previous. Maybe I have made a mistake in expecting the bees to be there when winter is over in that time. Perhaps it is a new season. However, I have always lost some in the spring after they were placed on the summer stand, and I think the present season will be no exception to the rule.

Cook Co., III., April 2. C. H. McNEIL.

A Report from Canada.

I put 116 colonies into the cellar early last November, and they are there yet. Swarming is still fairly good, so I do not know when I will be able to put them out, nor what my luck will be when I do. We have had every variety that I had set to one side are in fine condition, and will come thru in good shape, so I am hoping for the rest of the season.

A. BOOMER.
Ontario, Canada, April 5.

Wintered In the Cellar.

The bees are still in the cellar, and "roaring" to get out, but the weather is unfit. Cold and high winds, with steady alternating, make it unsafe. They were put into the cellar Nov. 8th. Ten of the colonies have been removed and put in the worst (26 colonies) were given a flight in February. Up to March 7th none showed any signs of swarming. March 13th three of these colonies that had not been taken out were spotting the hive-entrances and crawling about it, and perhaps a gallon and a half of dead bees were on the cellar-bottom. A week later all 10 of the hives were spotted, and to-day about half of those that were given a flight yesterday were having their hives spotted and the cellar-floor is covered with dead bees, making fully a half bushel from the 30 colonies since Nov. 8th. The temperate to make cows pay, we Sharples Cream Separators. Book "Business Drifting." A Cat. 21, free. W. Chester, Pa.
Belgian Hares **CHEAP.**

PEDIGREED AND COMMON STOCK.

1900 a Dry Year—Prospects Fair.

My bees began carrying in pollen about April 5th. It is cold and windy, and we have just had 4 days of rain, so the bees have not been out.

The wind on March 20th was in the northwest, and it raised a little on that day; old settlers say that is the sign of a wet summer. I hope it is, for 1900 was the driest year I have ever seen. We had plenty of rain in April, 1900, to raise the wheat, but, for the most part, we did not have any more to amount to anything until March, 1901, and the wells and springs were nearly all dry, but we have plenty of water to draw on.

I hope this season will be a good one, for we have had two poor ones in succession.

Sussex Co., N. J., April 8.

temperature has not been lower than 45 degrees or more than 88 degrees all winter. The covers are sealed down, bottoms the deep side. Thunbergia's in native colonies and other bees. They are clustered below the bottom-bars, some being on the floor of the hive, and others hanging out of the entrance, as if preparing to swarm.

I would venture to guess that a pretty good-sized swarm was in the air during the few minutes that I was there. We took a survey of matters, and "closed up," concluding to give them their liberty the first day the weather would permit.

We used the last section of our 1900 crop of honey at dinner today. It is a regular dish at our house, and no unpleasant results have come of it as yet.

Success to the American Bee Journal.

SIOUX, IOWA, April 1. F. W. HALL.

A California Lady Bee-Keeper's Experience—Dark Beeswax.

I have kept bees for the last 5 years, and the first year were very good, honey-years, but I know very little about the business. The year 1900 being a very poor year, I rented the bees to a man who claimed to be a scientific bee-keeper, and he divided them as long as there was any honey to be had; after that he did not rent them to any one, and when I first started (1899) they were not wanted for the demand was not great, and I was supposed to do nothing but build up the colonies. The bees wintered all right, and are doing well. I will attend to my colonies this season, hiring help when necessary. I never wear a veil or gloves, and I am very rarely get stung. I treat them as I do people—never go into their house without rapping, then wait for them to come up to me before I raise the cover. I then give them a little smoke, but not enough to make them think that their house has turned into a smoke-house.

Some people seem to have a great deal of trouble with dark beeswax. I think the amount needed to melt it is hard to manage. I have some very dark beeswax made from starters, I had about 200 frames containing starters about 2 inches wide; I wanted full sheets of foundation, so last fall I exchanged them. I put the starters into an iron kettle to

Red Clover Queens

LONG-TONGUED BEES ARE DEMANDED NOW.

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2); or, one Tested Queen free as a premium for sending us FOUR new subscribers (with $4.00).

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to run a full campaign for the coming season. His bees average quite a good deal the longest tongues any yet measured. The Breeder will use direct from Italy, having imported him himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring vell or smoke. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—first come, first served—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and they will be clipped and well marked.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.
144 & 146 Erie St., CHICAGO, ILL.
melt, and they were nice and yellow before I put them in, but after they were melted into wax I never saw such black stuff. A bee-keeper told me that he thought it was the iron kettle that did it. My apiary is in the orchard. I had 110 colonies, and the apricot trees were in full bloom when the picture shown herewith was taken. The people in the picture are the two young men who had rented the apiary, and a young woman who was working for us. I don't care for long-tongued bees. I have no use for long-tongued women, and I am afraid they might be like them—using their tongues where they have no business to.

APRIL

FRUIT TREES ARE IN FULL BLOOM, AND THE BEES ARE HUMMING.

I like the American Bee Journal very much.

(A. P.) Arte Bowen, Merced Co., Calif., March 5.

POOR LOCALITY FOR BEES.

This is a bad country for bees; most of them have started to death this winter. I will have to feed mine as soon as the weather is warm enough. I have not lost any colonies yet. It is snowing every day.

John Berk.

Polk Co., Neb., April 2.

FEEDING SUGAR-CANDY TO BEES.

On page 201 Dr. Miller asks for the experience of those who have fed candy. One winter I fed a number of colonies with candy made as per directions given in "ABC of Bee Culture," and I am sorry to say that it was a dead failure. The candy seemed to be all right, but the bees were put out by the winter experience is enough for me. I have a suspicion that the cheapest and best way to feed in winter is to give them comb—bees would do, of course. I fed it to some of my colonies during the past winter.

Hennepin Co., Minn. WM. Russell.

TAXING BEES IN IOWA.

I notice on page 211 you discuss the question of taxing bees. In this State the list of exemptions includes 10 colonies of bees, all poultry, and various other articles, and then says that all other personal property is taxable, which includes all bees over 10 colonies. Now, that there is a hardship—exempting 10 colonies. How would it seem to exempt 10 acres of land, 10 cows, 10 hogs, etc. all turn the list of personal property? Isn't it the same principle? Why shouldn't I pay taxes on 10 colonies as well as my neighbor on 40 or 50? And don't you suppose 15 will be about the usual number owned by the average man of beekeepers in February or March, which is the time our assessors generally call? And who will pay under this law? Only those who have worked up so large a business that they can stand the loss, including the assessing, which would make it.

they had a large number of bees. Then there is poultry—all poultry is exempt from taxation in Iowa, and there are probably a hundred dollars worth of poultry to one dozen bees; and no doubt the annual cash returns from poultry are as much, or more, in favor of the poultry tribe. So if there are any tax on property having a fixt value, and are a more or less certain source of income, then by all means let poultry pay.

It is evident that there are reasons for exempting property from taxation—two very good ones, and probably others. But I am not encouraged to encourage any industry that is a benefit to the country in general. Now, why have not bees the very best claim on both of these grounds? They are the ideal property for a poor man—not that he can make money rapidly and easily thereby, but they require little capital for a start, many successful bee-men starting on nothing, even catching their first swarm as strays. And as it is generally admitted that bees are necessary to the cross-fertilization of our fruits and flowers, and thereby the increase of the people in general, we can claim exemption on that ground that any class of property can.

We are not claiming that bees are not tax-able, for we believe they are in this State, but we think they ought to be exempted for the same reasons.

Personally, I have never paid any tax on bees, as our assessor never asked me to list my bees once, and then I told him (and I think truthfully) that I did not know how many colonies I had at that time, as it was in February or March. I told him if he would call again he should find that I had added nearly all that I had. So he said he would let it go. I have no idea that there ever was a dollar tax paid on bees in this county.

E. M. Smith.
Crawford Co., Iowa.

Weather Too Bad to Put Bees Out.
I put 5 colonies of bees into winter quarters, but lost one. I wish that we might have pleasant weather so that I could put them out. It rains or snows nearly every day, but we are hoping that it will soon change.

Lavina N., York County, in this vicinity. The bees did not do much of anything, and the colony that I lost was a young swarm which stored very little honey. I gave it 4 combs of sealed honey and thought that would bring it thru the winter all right, but about a month ago I found it dead. There was a little honey left in the hive, and also some sealed brood, so I do not know what was the trouble.

$15.00 and $25.00 Queens

Having a Measured Tongue Reach.

The call for queens of our celebrated $200 imported mother has been so great that we have decided, in addition to the $2, $4.00, and $6.00 grades of this stock, to offer some $10.00, $15.00, and even $25.00 of this same blood. But these prices are for tested queens, the tongues of whose bees have been measured.

The $10.00 queen is guaranteed to produce bees with a tongue-measurement of 19-100.

The $15.00 queen, 20-100.

The $25.00 queen, 21-100.

These last are very rare and with one exception this (21-100) is the longest tongue reach yet secured. We reserve the right, when we do not have the stock with the tongue reach called for, either to return the money or to send the next lower, remitting the balance. Editor.

CHICAGO, ILL., MAY 2, 1901.

FORTY-FIRST YEAR
No. 18.

WEEKLY

MAY

BY EUGENE SECOR.

One day
I past an orchard where the bloom
Seemed coaxing honey-bees
To stop and sip its tempting wine
And pack their basket-knees
With pollen-bread on which to dine—
Both laden with perfume—
And it was May.

In May
The dandelions ply their art
To spread a honey-feast;
They fling their yellow banners out
Against the beaming East
As if to say to bees about,
"We yield our inmost heart—
Kiss us, we pray."

In May
The birds are busy building nests
Or guarding pregnant eggs;
King Corn, the buried out of sight,
Is soon upon his legs
To prove the crown is placed aright—
For all the loyal West's
Corn-men so say.

Survey
The clover-fields, the grazing herds,
The dogwood in full flower,
The trees that stretch an inch each day
With quick'ning shine and shower.
Survey, and tell me, need I say
In stronger, ampler words,
That this is May?
WE WANT
1,000 NEW Subscribers
During May and June.

We want
We want
We want

500 of our present regular subscribers, whose subscriptions are now paid in advance, to help us get the 1,000 NEW SUBSCRIBERS.

each one of you to get just TWO new subscribers, and the job will be done! See?

to ask you to get them only for the rest of this year—to the end of 1901. And the price will be but FIFTY CENTS EACH—or $1.00 for the two new subscriptions.

We want to offer to each H. one who sends us 2 new subscribers on the above condition, a copy of

DOOLITTLE'S

"Scientific Queen-Rearing," free.

We have just issued a New Premium Edition of this fine book, bound in leatherette cover, with round corners. It is in every way (excepting just the cover) the same as the cloth-bound edition. This is

A MAGNIFICENT OFFER,
and every one of our paid-in-advance subscribers who has not already a copy of Doolittle's "SCIENTIFIC QUEEN-REARING," ought to jump at this generous offer.

Remember, it is only for May and June that we are making the above offer, so you'd better be quick about it if you want a copy on the easy terms mentioned—for sending us only two new subscribers to the Bee Journal at 50 cents each, for the balance of this year, beginning as soon as their subscriptions are received here with the $1.00 to pay for them.

Doolittle's "SCIENTIFIC QUEEN-REARING" has 128 pages, and describes the "method by which the best of queen-bees are reared in perfect accord with Nature's way. For the amateur and veteran in bee-keeping." It also contains Mr. Doolittle's management of bees for the production and care of comb honey. Every bee-keeper should have a copy of this book.

The Books are Now Ready to Fail.

Will you be one of the 500 to have a copy of it on the above premium offer? If so, your answer will come soon with the $1.00 and the names of two new subscribers.

If you have Doolittle's book, you can choose one of the following instead as a premium (postpaid) for sending the two 50-cent subscriptions:

1. Two Porter Bee-Escapes,
2. A No. 3 Bee-Veil (made of all cotton canvas)
3. Parker Foundation fastener for sections
4. Spur Wire Imbedder & Cogshall Bee-Brush
5. Cogshall Bee-Brush and Carlisle Comb-Foundation Cutter
6. Carlisle Cutter and Spur Imbedder

The foregoing offers will not appear again. They will be in force only during May and June—this month and next.

Now for the 1,000 New Subscribers!

Address, GEORGE W. YORK & CO., 144 & 146 Erie Street, CHICAGO, ILL.
Next National Convention.—It seems from the following, sent us by Secretary Mason, the next meeting of the National Bee-keepers’ Association will be held at Buffalo, N. Y., Sept. 10, 11 and 12, 1901:

Editor American Bee Journal:
Many inquiries have been received by the Executive Committee of the National Bee-keepers’ Association regarding the place for holding the next convention. The reply has generally been that Buffalo, N. Y., would be the most suitable place for holding the next convention. It has been decided to hold the meeting at Buffalo, N. Y., during the morning (April 17th) the date of meeting had not been settled upon.

The President of the American Pomological Society wrote President Root in part as follows:

"As bee-keepers and fruit-growers have many interests in common which could be considered and discuss with mutual profit, our Executive Committee has instructed me to extend to your Association a cordial invitation to hold a joint meeting at some time during our session, the exact time to be decided later by correspondence.

"At this meeting we would suggest that the subjects of discussion center round the general value of the mutual relations of bee-keeping and fruit-growing—....which can be briefly treated by speakers selected in advance from among prominent bee-men and fruit-men...in order that a better understanding of these mutual relations may be reached.

It has been suggested that a considerable portion of fruit-growers do not yet appreciate the preponderance of the benefit derived. It is felt that a full public discussion of the subject will, therefore, result in good to both industries."

Realizing, as the Executive Committee did, that this was a golden opportunity for presenting the bee-keepers’ side of the subject to the representative men of the fruit-growing industry, the invitation of the Pomological Society was accepted by the committee in behalf of the Association.

We have had to delay the fixing of the date for the convention until the Pomological Society had fixed their time of meeting. Our convention will be held on the 10th, 11th, and 12th of September next, commencing on Tuesday evening the 10th.

We were at first undecided as to place of meeting, hoping that the t., A. R. B., held at Denver, Colo., but when it decided to meet at Cleveland, and we received the invitation of the Pomological Society, we felt that we ought not to miss such a splendid chance to enlighten some of them on the relation of bees to horticulture, and by meeting at Buffalo, the York State and Canadian bee-keepers would be within easy reach of the place of meeting; so we at once fixed on Buffalo as the most desirable place.

It has been decided not to have any papers or essays, but to rely wholly on the question-box to bring out the best and most important matters for discussion; so any one not being able to be at the convention, having any question or questions that he may wish to discuss, can send them to the Secretary at any time.

The executive committee has taken the liberty to request the Secretary of the Ottawa Bee-Keepers’ Association to ask the members of that association who may attend the meeting at Buffalo, to bring their badges with them, and wear them at our sessions, whether they are members of our Association or not, so that we may find more men, and know who our progressive neighbors are.

Information regarding place of meeting, entertainment, and railroad rates, will be given as soon as decided upon. Don’t be in a hurry about securing a sleeping-place during the convention. There is plenty of time, and, later on, better rates can be secured; but if you are in a hurry, write to the Young Men’s Christian Association, and they will be lied by “sharks.”

A. R. Mason, Sec.
Sta. B, Toledo, Ohio.

We trust that all who can possibly arrange to do so will endeavor to be at the Buffalo convention next September. It ought to be a bigger and better one than was the Chicago convention last August—tho, of course, that hardly could be expected even at Buffalo! (Now, see Mr. Hershiser buckle down to the job of trying to outdo Chicago.)

"There is Always Plenty of honey," said a honey commission dealer to us several years ago. That seemed a strange remark to make, especially in view of what have commonly been termed “poor honey-years,” which have been somewhat frequent in appearance during the past ten or fifteen years. But Mr. Dealer knew what he was talking about.

The year 1900 was said by some, not by the "oldest (bee-keeping) inhabitant," to be a most barren year for honey in thirty years. And yet what do we find? Why, more honey in the hands of dealers to be carried over, we believe, than for a number of years past. One dealer, about two months ago, had eight or ten car-loads of white extracted honey on hand yet. We know some others who also have quite a quantity left on their hands. Likely all of them will have to wait until next fall before it can be moved off; and then, if there should be a large new crop, it will have to be sold at a loss.

"There is always plenty of honey" comes pretty near being the truth. But it would not be true if there were anything like a more even distribution of the honey crop each year. Why, there wouldn’t begin to be enough to go half way around if that were the case. The great trouble is, so much of it is shipped to the large centers, thus glutting those markets, causing a demoralization of prices, while many near-by, the smaller markets, are entirely bereft of honey. And often in such local markets the very highest prices are realized.

In a city of about 2,500 population, not quite a hundred miles away from Chicago, a leading grocer agreed to take as high as five car-loads of strawberries grown within 15 miles of his store, at 10 cents a quart! Think of it! And yet, in Chicago strawberries are often sold at four quarts for 25 cents! Why is it? Simply because nearly every straw-berry-grower in the country thinks he must dump his crop on the Chicago market. It is all wrong. And it is the same way with honey.

Far better prices would be secured if much of the stuff that is sent to Chicago, or to other large centers, were sold nearer home. This is a subject worth careful investigation.

Short-Tubed Clover is nowadays discussed along with long-tongued bees, and it is reasonable to believe that the seed saved from the first crop of red clover will have in it a larger percent of the short-tubed kind than that from the second crop. A little explanation will help to an understanding. At present it is only the second crop of red clover that is a seed crop. That is because the fertilization of the blossoms is effected almost entirely by bumble-bees, and at the time of the first crop there are not enough bumble-bees to fertilize more than a very small number of blossoms. For unlike bumble-bees, a single bumble-bee starts a nest in spring, and only later on do bumble-bees appear in numbers.

So it happens that the proportion of bumble-bees to bumble-bees found working on the first crop should be many times greater than on the second. It will be only the short-tubed kind that the bumble-bees will visit, of course, and the seed from that will be likely to reproduce itself. It will be easily understood that at first only a small amount of seed would be secured on any given surface, but the proportion ought rapidly to increase from year to year. It may be well to speculate a little on what might be the outcome. Suppose we take a plot of ground from which a bushel of seed of the second crop might be secured. Save the seed from the first crop, which may be a pint or less. But in that pint half the seed may be of the short-tubed kind, whereas in the second crop there would not be one in a thousand. Now sow this pint the next year in a plot by itself. It is reasonable to expect that at least half the plants will have short tubes, and so half the seed will be of the improved kind. Continuing in this way, it would be not a matter of many years to have seed in unlimited quantity, half of which would be of the short-tubed kind.

But another factor comes into the problem, which greatly hastens the result. As soon as the amount of ground covered by clover from this half and half seed assumes tolerable proportions, the seed fertilized by bumble-bees
will no longer hold the same proportion as at first. For the number of bumble-bees is a limited quantity, and they can only fertilize a fixed number of flowers. For the sake of illustration, suppose there are enough bumble-bees to produce a bushel of seed within a given area. A small field will suffice them, if the field be ten times as large they can fertilize no more seed. Now suppose enough of our half-and-half seed is sown in that area to produce two bushels of half-crop seed. This will be a half-and-half just so long as we do not go beyond that amount. But whenever we go beyond the crop of two bushels, then not only a proportion of the increase, but all the increase should be short- 
tubed.

If a peck of seed is sown to the acre, and the crop harvested is three bushels to the acre, there is a twelve-fold increase. So when our bushel of half-and-half seed produces a crop of 12 bushels, 11 bushels of it ought to be of the short-tubed kind, and this 12 bushels sown ought to produce 144 bushels having only one bushel of long-tubed seed in it, or 99.3 percent pure. It is the fact that we have not to cut this out in each kind the difficult thing is to get the first bushel of half-and-half seed.

After that the way is easy. Indeed the way ought not be very hard after the first pound is secured.

Of course, all this is only speculative, and like many another thing in bee-keeping, may not “pan out” at all as anticipated; but the great importance of the matter warrants some speculation, and this may serve at least to arrest the thought of some wild-awake bee-keeping farmer, and to secure from him some effort toward the desired end.

**Shipping Combs for Wagon-Hauling**

The right way to load combs, either brood- 
combs or sections, has been a matter of some difference of opinion. When loaded on cars, all seem to agree that the edges of the combs should point toward the engine, as the bumpting is from front to back; but some say that they should be divided as to loading on a wagon. Perhaps all will agree that on a smooth road on a very steep hill the loading should be the same as on a car, but ordinary roads are not so very smooth, and the hills are not so very steep.

The editor of the Bee-Keeper's Review champions loading the same as on a car, and gives reasons why he thinks that ought to be the better way. A few have given the result of actual experiment, one of which is given in a Straw in Gleanings in Bee-Culture as follows:

March 25th the roads were muddy and rough. I drove down town, putting in the wagon from the car, setting them in the skid. The front one ran across the wagon and the other lengthwise. The one running lengthwise fell down. Then I put the front one lengthwise and the other crosswise. As often as we fell I set them up again, constantly changing to whatever level they fell in. That was a hard job, but going down the steepest hills 60 miles in 1 day.

It seems when loaded with combs the way which seemed best seems to go best. I have been having combs on that trip, don't you believe they should be divided always? It is a matter of report how the same thing works on your road.—[This is an interesting and valuable experiment. It is so easily tried that wonder none of us had thought of it before, would suggest that those of our readers who have "drive to town" pretty often over map roads, try the same experiment and report. From the results above given it is very clear that the edges of the combs should point toward the wheels and not toward the horse.—Editor.]

---

**Bees Attack Mountain-Climbers.**

A correspondent from Honolulu, sandwich islands, states that a peculiar occurrence in that country in which a mountain-climbing party was attacked by a colony of wild bees, and came near losing their lives. They had climbed Komahnhui, the highest peak near the city, and decided to descend on the Nuuan Valley side, which had been considered impossible. They stumbled down precipitously cliffs 50 feet high, clinging to the rocks with hands and feet. When part way down they were attacked by the bees, which stung them while they were helpless to ward them off. For nearly a mile the bees followed them until they reached a point where they were safe.

---

**Mr. John Zwarlen, of Emery Co., Utah,**

gives the following report for 1900, in the Rocky Mountain Bee Journal, being as average of 292 pounds of extracted honey per colony.

I see it stated that Olliver Foster produced 86,000 pounds of honey last year from 500 colonies. I have done better than that. I secured 169,000 pounds from 65 colonies; and Christian Ottensen, 23 miles farther north, in this county, did even better, but I cant say just how much.

---

**Editor Mitchell,** who undertook part of the editorship of this paper last autumn, has been compelled to abandon the undertaking. His eyes for the past year or two have been of more or less trouble, and of consequent great distress—to one who has to use his eyes almost, continuously, as does a printer and editor.

This paragraph is taken from the April Progressive Bee-keeper. We regret very much to learn that Mr. Mitchell's ailment has compelled him to relinquish some of his undertakings, and trust that the enforced rest and recuperation may soon bring him out all right.

---

**President E. S. Lovest, of the Utah Bee-keepers' Association,** writing us from Salt Lake Co., March 12th, has this to say:

"Friend York:—Spring appears to be with us as usual; the old honey bee trees, and the birds, in fact all Nature seems to be putting on new life. Our bees were carrying in pollen March 1st—something they don't often do so early. And we are having a great deal of snow and rain, which is pretty generally distributed over the state, thus insuring a good supply of irrigating water, which in turn will insure good crops and a good honey-flow. If the weather keeps up as it may expect to see our bees and bee-keepers in 'cllover' once again. The bees that went into winter quarters in good condition appear to have wintered fairly well, while a few smothered for lack of ventilation. The smelter smoke here in Salt Lake City has been the cause of our principal losses."

Again on April 14th Mr. Lovey wrote us as follows:

"The prospects are excellent in Utah this season for a good honey crop... While the bees are in fairly good condition, barring any accident that we know not of, they will give a good account of themselves."

---

**Editor Leahy,** of the Progressive Bee-keeper, it seems, there is a "harm break" made by Stonem in Gleanings in Bee-Culture, where he tried to make "harm" rhyme with "barn." After copying the questionable stanza (see page 234), Mr. Leahy follows with this comment:

"It's rather a stretch of poetic license, and tho we are quite willing the price of clever be brought down, we are not prepared to sacrifice the harmony of "harm" and "barn." The following from the pencil of a dependable Ohio yokel is more jingle and rhyme, and is more to the point:

"Oh, bury me deep, deep in the ground.

Where the humming-birds can't get at me.

And the straddle-bag straddles around."

We must confess that Mr. Leahy's cultivated choice of poetry does have a clear-cut kind of jingle that no one can mistake or fail to appreciate. In the "harm" and the "barn" of the thing there is no humbug pretty, even if there is in some measure that "straddles around" with so much importance.

---

**Mr. W. F. Ordetz, of Cuba, under date of Jan. 224, says that the present season has been the poorest ever known in that section, and concludes the information with this paragraph: I started with 8 colonies in December, and now have 50. They will soon be ready to divide again." No doubt that report is rather discouraging to the bee-keepers. He would be surprised to learn how very little sympathy it will elicit in these United States of America, where so many of us should consider ourselves very fortunate to accomplish in two whole years what he has done in two months."

---

**Mr. A. E. Willett, of Hampshire Co., Mass.,** sent us a clipping some time ago telling about a "happening" down in Hampshire last fall. It says: "Some of the families in a small village set in a fire was kindled in a fireplace in one of the houses in that city, that had not been occupied for some time. When the fire had been burning for about half an hour, the man of the house, upon coming into the room, found the floor covered with a sticky subst- change, more of which was running out of the fireplace. It was found that a swarm of bees had taken up their abode in the long unused chimney, and had there stored a large quantity of honey. The heat from the fire caused it to run down in a stream into the room, overing the carpet. The householder said he got 40 pounds of honey out of his carpet. He probably did not feel like singing that part of the chorus of the song, "Busy, Buzzing Bees," where it refers to "honey everywhere."
Contributed Articles.

No. 3. - Drone-Bees and Their Utility.

BY C. F. DADANT.

SINCE writing the two previous articles on this subject, I have met with some private arguments. I have been told that it is a mistake to try to change Nature, that even if I can reasonably argue that it is best to prevent the rearing of drones in most circumstances, it is an error to change natural conditions. I cannot agree with this.

When we breed any kind of animals in domesticity, their natural conditions are already changed. No one thinks of trying to prevent the free breeding of wild fowls in the proportions which Nature has dictated. Where is the breeder of domestic fowls who will allow all the roosters to live? Where is the farmer who will keep all his male calves as bulls? And do we not succeed best by artifical selection? See with what care the farmer's wife picks out the finest roosters for the following season's use. And if she were careless, and killed or sent to market the finest of them, would you think she stood any chance of improving the breed? What is done with chickens or with cattle—can it not be done with our bees, in the measure of our power? Why do we not see a few days passed since the reproduction, owing to the peculiar habits of the bees in their mating, but we can, in a great measure, direct the greater or less rearing of good or bad stock, and if we would succeed, we must do all that can possibly be done.

In natural conditions, a colony may be several miles from its food or breeding place, and may as well be divided as it may produce. On the other hand, in domesticity, we may keep a hundred or more colonies in one spot. In that case, we have, if we leave it to the nature of the bees, a hundred or more times as many drones as will be needed for all young queens that we may rear. We are therefore feeding, if we leave the bees alone, hundreds of thousands of drones that cost both food and heat to be reared, and whose problematic usefulness is in the possibility of their keeping open the hives, or in a few days, on the introduction of some other bee species that will increase the honey-production. In an apiary of one hundred colonies, we may have had hundreds of thousands of drones, which will yield twice or three times as much honey as the average of the entire apiary, and at the same time we have a few colonies that will produce little if any more than enough for their own consumption. Now may I ask how can they be reared in the same hive if we do not encourage in all possible ways the breeding of the best, we must also try to breed the greatest number of drones from some of those preferable colonies. Yet, to avoid in-and-in breeding, which Nature so abhors, we should not breed both queens and drones from the same colonies.

These propositions being well established, it remains for us to decide not only how to get the greatest possible number of drones from the best colonies, but also how to prevent the propagation of the queenless and inferior drones.

Let me here open a parenthesis. I see that the question of the fertilization of queens in confinement is again agitated. If this were a success the fertilization of queens would be comparatively easy. But these things have been tried many times before, many sensible men have shouted "Victory!" only to find a little later on that they had allowed themselves to be deceived by appearances. Time will settle the question, but even a satisfactory solution would not affect the question of rearing valuable drones, and doing away with the valueless ones. I will now return to the matter on hand.

To secure a great number of drones from a colony is not difficult, especially if the queen is prolific. We need but to place drone-combs, one at a time, in the rear of the broodnest. Althou the queen dislikes to lay eggs in these cells, until after she has bred a large number of workers, the situation of these combs will induce her to lay in them earlier in the season than she would have done otherwise, and we will readily secure a large number of valuable drones early. As to the hive from which no reproduction is desirable, we must confine the drones to the hive, and rear them from drone-combs of days, or by keeping the workers in the cells before they hatch, or simply prevent their being produced by removing the drone-comb before the laying has begun, and replacing it with worker-combs.

The first of these methods is certainly the worst. Many aplanists use the well-known drone-guard in front of the hive. This is a sort of "yard" made of perforated zinc placed at the entrance of the broodnest, and throu which the worker-bees alone can pass. The drones and the queen are compelled to stay in. It is also used to prevent swarming. Tho it answers the purpose, it is not practical because when the drones are induced to take flight by the warmth of the sun, it is impossible to segregate with the guard bees in the way of the bees. Some people open the guard to let the drones out, and close it again to keep them from coming back. It would serve the purpose in compelling them to stay on the outside, and starve if they short life is too much drone-comb or drone-reared, but thou they are going and coming, and no satisfaction can be had out of such a method. The drone-trap is much better, for as the drones get into it they are caught and can not return, and are out of the way, but it must be attended to with regularity, or they will die there and crete a pestilence.

The third method, of beheading the sealed drones with a hone-knife, before they hatch, is efficient, tho it also has faults. It is the only method that has allowed the expense of rearing those drones almost to the perfect insect, without any returns. Then the comb in which they have been reared is very soon again filled with eggs, and the colony must be done over. The method of getting rid of the drones satisfactorily is to prevent their being reared, by removing the drone-comb before any drone-eggs are laid, very early in the spring, and replacing this comb with worker-combs, or from extracting supers. This replacing of the comb is a necessity, for the same reason that has caused the bees to build the drone-comb in the first place will cause them to rebuild the same kind in the same spot, if we do not do so. By this method we can be able to remove every cell of drone-comb. In nearly every hive there are quite a number of little patches of drone-cells scattered here and there, and many of these pass unnoticed even in the closest examination, unless they are readily full of brood, in which case the peculiar rounding shape of the capping of the drones will make them noticeable. But the production of a few drones in any hive is not objectionable, for in the hosts of drones, since the comb contains 36 of them to the square inch.

In my estimation, the prevention of drone-rearing is of importance especially because of the cost of breeding them. I have always been of the opinion that it is cheaper to keep them after they have hatch. Yet, they certainly consume considerable honey after they have emerged from their cell, but I would be inclined to think that nearly half of the total cost of the beekeeping during the entire year is in the cell. It so happens to me of the greatest importance, on this score alone, to prevent their being hatch.

I am told that the bees will not accept the removal of the drone-comb, and that they will cut down worker-cells, to change them to drone-comb, when all the drone-comb has been removed. This I disbelieve, as it is contrary to my experience. They will rebuild drone-comb. If there has been much drone-reared, the bees will feel the need of it enough to tear down good worker-comb. In order to convince me that this has ever been done by bees, it would require a very thoror experiment, made on old apiaries where too much drone-comb had existed, and in the case of the Droy experiment, mentioned by me in a former article, when a colony had been furnish with nothing but drone-comb, they certainly would have torn down some of this comb to replace it with worker-comb, while
Prof. Cook's Review of the "A B C" Book.

By ENRY K. ROOT.

In the columns of the American Bee Journal Prof. Cook has given a review of "Dadant's Langstroth" and "Cowman's Honey-Bees," and now follows with a review of the "A B C of Bee-Culture." In his usual kindly manner, for one expects extreme carefulness on the part of one who has exerted a wider influence upon the bee-keeping world than any others ever written. Even its rivals can only be joyous in its extensive sale, as they know that, wherever it goes, "honey, and bees," remaining as those words do from one who is himself the author, and who has been through rival work, the publishers of the "A B C" would be hardly human if they did not feel a warming of the heart at their utterance.

First, it is proper to call attention to the fact that the criticisms are not based on the edition issued last January, as one would suppose, but on the old edition—the one put out nearly two years ago. As it is, much of Prof. Cook criticisms is not in the new book at all, such matter having been re-written or stricken out altogether.

As to the first error pointed out, there is no error in the book, but the error consists in very careless reading on the part of the reviewer—a carelessness that is hardly excusable, for one expects extreme carefulness on the part of one who has pointed out the errors of others. The "A B C" page 2, in discussing what is to be done with second swarms that issue, says in effect that they must be watched, climbed after, and hived. This sentence is immediately followed by the statement, "Prof. Cook says, 'I don't think this too much trouble, he should prevent having after-swarm as I advise under that head.'" He ignores the fact that the watching and climbing refers only to swarms that have issued, to say nothing of those that may be hatched out from the combs. It is possible for a bumble-bee to prevent the issuing of a swarm after the swarm has actually issued. He goes on to give the Heddon as the best method of preventing second swarms. In the edition just out of the press the very next sentence refers to the Heddon plan. Among other methods of preventing after-swarms, the Heddon plan gives more fully and correctly than it is given by the reviewer. If careless reading is inexcusable on the part of a critic, still less is careless quotation when the exact words are pretended to be given inside quotation marks. In answer to the question as to what shall be done with a second swarm that has issued, the "A B C" says, "Candidly, I don't know of any better way than, etc." etc. Candidly, I don't know of any better way to prevent second swarms than," etc., is the way Prof. Cook quotes it. We feel sure that he will say there is no sufficient excuse for interjecting the words "to prevent second swarms" in a direct quotation where they were neither written nor thought by the author of the book.

Prof. Cook objects to the statement that alfalfa honey is probably superior in quality to any other. He claims to be something of a judge of honey, and thinks alfalfa no better than clover, linden, sage, and perhaps more. It is a matter, not of judgment, but of taste. The best butter might prefer a flavor that no one else would fancy. The criticism, however, is a valid one. In matters which appeal entirely to taste, it is unwise to make sweeping statements.

Speaking of alfalfa the "A B C" says it takes about three years to get it to its best yield. Prof. Cook makes the pleasant correction that in California the maximum yield is often got the very first year in the later cuttings. The reviewer thinks it is putting it too strong to hint that it is always early in the gathering from the dry hay. The simple truth is told that "one man reports so much sweet in it that he has seen bees by the thousand working on the dry hay in the spring." Speaking of this matter, Prof. Cook says, "This is putting it altogether too strong. Still, I do not think that too much can be said in favor of alfalfa, for it is a marvelous crop." The good Professor will probably indulge in a quiet laugh when he sees this. "You are saying altogether too much for alfalfa," and "You can not say too much for alfalfa," Which is one to believe? Prof. Cook objects to the definitions of digestion given by the author, saying, "This is given as a question [what can be meant by that] by a man who has a degree of authority of the organization of authority. Not all will agree as to this, seeing the authority selected was no less than the able and careful T. W. Cowman. Prof. Cook teaches that 'digestion is rendering the food usable by the animal.'

Our reviewer says "malphygian" should be "malpighian." So it is in the latest edition, and one would hardly suppose an older edition should be the one reviewed. But his correction needs further correction, neither the book nor the critic being right, for "malpighian" should be "Malpighian."

The "A B C" says, "The blacks are also easier to shake off combs in extracting time, and for that reason alone, should be preferred." The author thinks this too much can hardly be shaken off. Prof. Cook says, "I have very little trouble to fell at one shake every Italian bee from the comb if the latter fully fills the frame." If Prof. Cook can shake every bee from the comb at one shake, he has not yet acknowledged a lasting favor on some of the veterans if he will make the process known. In spite of their shaking off so easily, he considers they stick tighter than the blacks, and prefers giving that account, for the best men stick them in their homes. There are times when one wants bees to stick by their comb, and then he will prefer the tighter grip of the Italians; but at times when one wants bees to shake off, as in the case mentioned, will one not prefer that the bees he is try to shake off shall shake off rather than stick? Prof. Cook says, instead of Mr. Benton spending years in India, he "was in India only a few days." In relation to this point I have a letter from Mr. Benton, who says, "I left Cyprus for India in December, 1880; returned to Cyprus in May of the following year—absent just five months." While the statement in the "A B C" was not strictly correct, Prof. Cook is no nearer the truth, for he has gone clear to the other extreme.

Prof. Cook thinks it unfortunate that the "A B C" uses the term "worn" and "grab" as synonymous with larva. That criticism is worth considering, at least so far as to avoid calling a bee a worm during its early life. Whether more than one than the author means by this we do not know. To his credit be it said that Prof. Cook is consistent in that he does not speak of wax-worms, he calls them larvae or caterpillars. It is feared that, if a bee-keeper were to say that caterpillars had eaten up his combs, he might be laughed at. It is very likely, too, that for many years to come good scholars will say that wormy apples have worms in them. Moreover, when no entomologists are around, an insect-larva is a worm, for so the dictionary says. So is a larva of any insect a grub, by the same authority.

Instead of pollen and honey partially digested being fed to larvae, Prof. Cook says it is pollen perfectly digested, with or without the addition of honey. When doctors disagree, one shall decide.

Prof. Cook objects to calling "viper's bugloss" blue thistle. He says it belongs to the borage family, is no thistle at all, and is like borage in being no serious pest—all of which he should have noticed is already told in "A B C." Blue thistle is one of its popular names, so given in the dictionary.

He thinks drones from laying-workers are as large as any, and it is likely that is true when they are reared in drones.

"It is very doubtful indeed that unimpregnated eggs will ever produce workers," says the reviewer. It is not said in "A B C" that they ever will.

The author thinks the impregnated should be used rather than fertilize. According to the dictionary, either is right.

Referring to feeding at night, Prof. Cook says, "Our author recommends this night work to prevent robbing."

If he will read carefully, he will see that it is not recom-
Advantages of Bee-Keeping for Women.

BY FRANCES ELLEN WHEELER.

In the effort to encourage and lead women into rural occupations, there is a tendency to extravagantly exploit the advantages and minimize the difficulties; that is misleading and unfair. This is especially true regarding apiculture. Probably no industry has been more frequently and enthusiastically recommended to our sex than the care of bees. Certainly no outdoor work, in some respects, is so well adapted to our general make-up, or more thoroughly fascinating and congenial. Thus far, our advisers are correct. Their mistakes arise from conveying to the novice an impression that the labor involved is of a light, superficial character, and that the profits are an assured fact, and to be confidently reckoned on. Some writers go still further, and state how many colonies the average woman can take care of alone, for an entire season, and what the returns will be for each colony.

Statistics look well on paper. Any one contemplating a new employment would feel better to know at the start just how much and how hard they must work, and what they will make at it. Some people are lost to undertake this enterprise unless they see in black and white the financial side of the question; which would be perfectly reasonable could the figures be relied upon. But in point of fact, there is scarcely any occupation where the unexpected is sure to happen, and the "unknown quantity" is so often to be reckoned with, as it is in an apiary; both as regards the labor involved and the profits received.

A little common-sense thought on the subject will show very plainly that no two women with the same amount of work in an apiary (and more than they will anywhere else), or obtain the same results. And that in our country, where the climate and the local flora are so varied, the quality and quantity of the crop must also vary. Still more important, the home markets range in prices according to locality for comb honey, all the way from 7 to 20 cents per pound; which affords quite a margin for speculation on returns. Moreover, is it fair to exact from this business what is not exacted from any other?

That an immense number of successful apiaries are scattered throughout our country is proof that bee-keeping pays. How near the "top-notch" can be reached, each individual must demonstrate by practical experience. A good instruction book, a periodical, and a few colonies, at the start, will speedily tell the tale as to qualifications.

After a few experiences alone in the yard, our novice may decide (as I did) that it pays best, in the long run, to have a good, strong helper, and that to secure this when needed, some other industry must be combined with the apiary, which will give full occupation to both, and relieve the woman of the heavy parts; affording her leisure to oversee the important details, and attend carefully to her market.

Again, tho we have sections where the climate admits of an apiary being worked almost the entire year, it is not so in our northern and middle States. Also, our pastureage is such that there are many localities where apiaries of 80 to 100 colonies only can be worked, year in and year out, to good advantage. Yards of this size will not, of course, furnish an income sufficient for a comfortable living; but, with a comparatively small outlay of time and money, they will add very materially to it.

Something might also be considered of our returns which are not reckoned in dollars and cents. I refer to the growth in physical and moral health gained by the pure air and loveliness about us; the development of spiritual and intellectual perceptions; and, above all, the sense of helpfulness and fellowship with these wonderful little creatures; and commendation,

"Whatsoever thing thou doest,
   To the least of Mine and lowest,
   That thou doest unto Me."

Clinton Co., N. Y.

Something More About Bees Being Necessary to Pollenize Fruit-Tree Bloom.

BY THADDEUS SMITH.

The advocates of the theory that bees are necessary for the complete pollination of the bloom of fruit-trees lay great stress upon the necessity of cross-pollinating and seem to think that bees are the only agents to accomplish this. By cross-pollination is meant that there are some varieties of fruit-bloom deficient in pollen, and the pollen necessary to fructify them must come from some other variety of the same fruit that produces more pollen. That there
are a few varieties of fruit deficient in pollen, is well known to all intelligent fruit growers, and they know equally as well that it is not necessary to have bees to accomplish the fertilization of the flowers from which they obtain their fruit, but successfully manage it in another way. It is found that all that is necessary is, to plant these trees deficient in pollen, near some variety that produces pollen abundantly, and to secure pollination by either of the following the different varieties in alternate strips of several rows each, and thus complete pollination is obtained without the intervention of bees.

An illustration of where cross-fertilization is sometimes necessary is found in the strawberry. Everyone who has planted a strawberry-bed knows that there are bearing and non-bearing kinds—pistillate and staminate varieties. The pistillate varieties do not bear pollen, and in order to make the strawberries fruit, they must be planted with staminate or pollen-bearing varieties. By planting the two kinds in rows from four to six feet apart, the pistillate those without pollen—are made to bear fruit abundantly. These pistillate blossoms do not produce honey on account of their being non-flowering, and consequently are not visited by bees or other insects; therefore they are not fertilized by them. But suppose the bees did visit them—they could carry the pollen from one to the other as easily if they were six rods apart instead of six feet. But they are barren or nearly so, if planted rods apart. But proof positive that they do not owe their fruitfulness to bees is that both varieties have made fine crops in the islands where there are no bees. Such a fact is worth a thousand words, as anything can be done by the air from one to the other of these lowly plants that creep upon the ground, to the distance of six feet or more, and with this fact fertile the bloom, could it not be carried a greater distance? and thus, more successfully from the elevated position on fruit-trees.

Growers of vegetables in greenhouses have found that for want of circulation of air, some varieties of vegetables did not bear fruit. A friend of mine has been induced to try putting a colony of bees in with their plants, and has found some benefit from it. The benefit was not, primarily, caused by the bees carrying pollen from one flower to another, but by the pollens that have been blown by the wings of the bees while gathering and transferring pollen to the little receptacles on their hind legs, that lodged the pollen and set it in motion to be borne in the air, to the flowers in the plants. In feeding flour to bees, an increase in the size of the bee-house, and the number of bees. 

Up-to-date growers of vegetables under glass have been since discovered that the dissolving of the pollen and setting in motion could be accomplished without bees, and was equally as successful. They simply go thru the house with a long tube, and give each flower a little shake, and the work of pollinizing is accomplished! This completely substantiates my statement, that the benefit from the bees was because they put the pollen in motion.

The ways of the propagation of species in the vegetable kingdom are wonderful and past finding out,” but it affords a theme for interesting investigation which should be conducted in an impartial manner for the purpose of arriving at the truth. It is possible and I maintain that there may be some occult affinity or attraction between the pollen and the flower of the same species of flowers by means of which the infinitesimal particles of pollen that are always floating in the air during fruit-bloom, are drawn as by a magnet, to the stigma when a short distance apart, and this is the case when my bees have not experienced any failures even under adverse circumstances—it seems there must be something of the kind. But this is speculation, and I am set for the defense of facts.

It is a fact that bees are seen in flowers with pollen on their feet and in their baskets, and they are seen to leave one flower and go to another with their pollen; but who knows it to be a fact that some of this pollen deposited in the first flower is not carried over to the second? Is there any way of finding out? And if it were left, do we know that this flower would not have produced fruit without the visit from this bee? I have known millions of flowers to be pollinated in this way, and I am sure, if allowed a run of six miles of them. If they will produce fruit in one place without bees, why not in other places? This claim is all conjecture based upon preconceived theory without a knowledge of sufficient facts to establish it as a truth; and when confronted with such a statement, it is necessary to turn your attention to growing fruit in maximum quantities and qualities without bees, it shows its weakness.

Since writing the foregoing, the American Bee Journal of March 14th has come to hand, containing an article on the same subject from Mr. Doolittle, who solves himself as discussing this subject with a neighbor who claimed that Mr. D.’s bees had injured his fruit crop by taking the honey from the bloom, and he wanted some nice money to pay for the damage. Mr. D. tells how he met this claim by proving to his neighbor that his bees were of great benefit to his fruit, instead of being an injury; and here is a sample of his proof:

“Going back to the creation of all things, all fruit or grain, any kind was not pollinated, but created to visit the flowers which secreted nectar, while those that did not secrete nectar bore fruit as perfect then as to-day.”

This certainly is a new revelation as to the creation of things. But Mr. D. explains that “thus far all is a matter of conjecture.” But nevertheless he represents himself as telling it to his neighbor, supposed to be less informed about such matters, as a matter of fact. With his explanation the statement is most absurd, even as a conjecture.

“So far,” he says, “is conjecture,” and then he proceeds to make some other assertions in this very remarkable article, that are in keeping with his way of stating things. He is thru with his “conjectures,” and has made no further explanation. “From this I go on to explain how that the first object of nectar in the flowers was not for the perfecting of the fruit, or to be used as a food or luxury for man, nor even to sustain the life of the bees, but as a means to an end, and this end was that insects of all kinds might be drawn to the flowers so secreting, that the fruit or female blossoms of plants which could not possibly be fertilized in any other way, might be fertilized thru the agency of insects, etc. Another new revelation—seed and fruit bearing plants and trees were made, but they could not possibly be fertilized so as to bring forth seed, nor fertilized with their own kind. It is only the flowers and then bees made to go after this honey in order to fructify the flowers. In the quotation given, Mr. D. places “insects of all kinds” in italics, in order to emphasize the assertion. If language means anything this is a false assertion. This is the following lines, the night prowling bedbug, et id genus omne. This is too ridiculous to require further comment.

I have great respect for Mr. Doolittle as one of our most reliable teachers and writers on bee-keeping, and I have read his articles in the bee-papers for the last quarter of a century with great interest; but when Mr. D. leaves the subject with which he is familiar, and gives us such crude speculation as this article contains, for matter of fact, we want a more reliable teacher.”

Peele Island, Ont., Canada.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

Now for the reader writes: “I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of these buttons as it will serve to give the conversation which started would wind up with the sale of the articles.” I have had many conversations with the people when they would say that they would have been fortified to make a purchase for a long time. It has a pin on the underside to fasten to the coat. Price, by mail, 6 cents each; two for 10 cents or six for 25 cents. Send all orders to the office of the American Bee Journal.
Questions and Answers.

CONDUCTED BY DR. C. C. MILLER, Marengo, Ill.

The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, with assurance that he will answer them here promptly. Please address the Doctor to send answers by mail.—Edtors.

Italianizing—Transferring—Painting Hives.

1. I have six colonies of black bees that did not swarm last season, but stored a little surplus honey, and have wintered very well. The hives were of the hive made by the queen with untested Italian queens? If so, at what time in the season should it be done? I do not wish to prevent them from swarming.

2. I have four colonies that are on frames that have thin top-bars that sag with the weight of the combs, and some of the combs are not built straight so they can be handled easily. Will it pay to transfer them to Hoffman frames with full sheets of foundation? If so, at what time in the season should it be done? There have been bees in the combs for 10 or 12 years. I wish to secure comb honey altogether.

3. Would it do any harm to paint hives with the bees in them?

Ohio.

Answers.—1. Almost certainly it would be a decided advantage to make the change. The only reason for putting in that "almost" is that it is a bare possibility that you have black bees that are unusually good, and that you would get Italians that are unusually bad. But that is very unlikely to be the case. The new queens can be given at any time when it best suits your convenience.

2. Most likely it would pay well to transfer to more satisfactory frames, whether Hoffman or something else is a question. If propolis is as plentiful with you as with us we will hardly want Hoffmans, but you can have frames that are self-spacing like the Hoffman without so much surface for propolis. But instead of changing the combs for foundation, why not transfer the combs into better frames? The age of the combs is nothing against them. The straight combs would be transferred very easily—do it in fruit-bloom— and it is possible that at least some of the crooked ones could be straightened, or put in piece-meal.

3. No, It will be all right, providing you make an arrangement with the bees that they will not sting the painter.

Clipping Queens—Other Management.

I expect to have about 40 queens to clip this spring. They are mostly in standard hives, but there was no brood foundation used. Will you expect the combs are not in very good shape to hunt for queens?

1. How would it work, to place a hive filled with foundation under a colony of bees (or perhaps have one frame of brood and a queen), place a bee-escape between the two hives, and below the escape have a cage of perforated zinc? Would the bees go down and accept the lower queen, and the upper queen attempt to go down and get caught in the cage?

2. You have the danger of draining the upper hive so thoroughly that the brood would be left to chill?

3. If this plan would work, how long do you think it would take to trap the queen from the time the escape was placed, in warm weather?

Iowa.

Answers.—Instead of answering your questions in order, please allow me to bunch them. In the first place, unless you have queens "to burn," you may as well dismiss the idea of having a queen below. Your idea, no doubt, is to have the frame of brood and the queen there as a sort of attraction, and not use the bees outside an extent an attraction, a strange queen would not. The probability, if not the certainty, is that she would be promptly balled and killed. Even if the bees should be friendly to the queen below, she would do no good. When there is a general shortage of foundation, the bees go with the colony goes with them. But in your scheme there is nothing of the kind. A bee leaves the hive in the regular course of its duties, and in doing so passes down thru the escape, and is unable to return. There is nothing about that to make the queen want to go down. Neither is there when two bees or several thousand have gone down. All that she knows is that there seems to getting to be a scarcity of bees, and that's no reason why she should desert her post in the brood-nest. So you may about as well give up the scheme as impracticable.

You do not say whether your object is merely to clip the queen, or to get the bees to move their brood-nest below. In either case, you can drum or smoke out the bees, hunt out the queen and clip her, then return. If you want the brood-nest to be moved below, put the queen in the lower story, with an excluder on it, then put the bees. If you don't want to move out the bees, you might try a new idea. Build a "brood-house" or set foundation (all the better if you can give it a frame of brood), with no excluder between the two stories, and allow the bees to work down of their own accord. As soon as the queen becomes crowded for room above, she will move down, and when you find eggs there you may find her. Possibly you may not find her, for until about all the space upstairs is filled with honey she will keep going from one hive to the other. But your chances of finding her below will be constantly on the increase, and after you find her, if you want the brood-nest to be below, you must use an excluder.

Before doing anything else, it will be well to make a thorough search, at night, and you cannot find one, two, or three frames that can be taken out, and then the rest might be cut out and transferred correctly into the frames.

The Afterthought.

The "Old Reliable" seen thru New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

MATING OF QUEENS IN CONFINEMENT.

The front picture on No. 12 resuscitates an old enthusiasm, or fad, or "image of something in heaven above," at the shrine of which we all did vainly worship in time past—until the missionaries of common sense gently led us away. Possibly they were misguided in doing so. "Go in," Mr. Hutchinson says, to everyone who can't be entirely "asy" in mind about our present breeding! I feel quite strongly that the power to mate the individual drone to one individual queen would do us more harm than good; but the present scheme of mating to a mass of individuals or a mass of queens, including the mass of drones, is no better. The old queen is wanting a select mass of drones, and she may find one, or a hundred, but she can't find them. Yes, that's the way it is—best to be she is what she calls her "natural" queen of a "natural" colony, and she wants to breed her bees as nature selected them, and in the most favorable way. Mr. Hutchinson says that "he who is in command of one queen, in the best of the colonies, can command a fair supply of drones."

I think, providing success could be had. As Mr. Hutchinson suggests, success must be theoretically possible, providing someone is willing to spend effort enough, and cash enough, in building big enough. But let me also revive a related idea. Those who live near great plains on which there is no tree or hollow crevice, and no bees, can perhaps have the same thing cheaper. Take your queen and drive out a few miles upon the plain, carrying your drone colony and your nuclei with virgins. Little islands are apt to be abnormally cool just when you want them to be hot; and at such stations queens drown, but plains include the best of the world.

Possibly I can suggest some improvements on the tent shown in the picture. Suppose we abandon the gasometer shape, and let the starting model of shape be that of a race-track roofed in—track only, center circle not occupied. Then flying around and around insects can go as many times as they wish in a course that will not require any halting and turning back. Suppose we abandon the netting and use cheap cotton cloth. Abundance of light will come thru it; and it may mout off of the tent to catch bees as they get out. Cheaper, much stronger, makes up on the sewing-machine much more kindly, holes which may develop will be visible instead of invisible—better every way (except perhaps the deadly didn't think-of-it one), and excepting the obvious objection that a drone must take a short cut to escape, when bees are imported. But with cloth cover and race-track shape I don't believe it will need to be more than 16 feet high. Presumably it will be possible to fly young queens and drones in such a course in ignorance of the fact that there is any
more to the world. Before you bulge, and after you have got this crude idea of shape well in your mind, you can push in two opposite sides of it until it is dumb-bell shaped instead of circular—hives to be at one of the bulbs. This modification will save one wall, save very greatly in the ground area required, and give the flies a perfect chance to twist wings. Each side at the sides can be arranged to pull up and tie at the top when not in use and thus offer little salt to a storm.

It will require considerable grace to do so, but I trust Mr. Davitte will be able to take it meekly if there is still “Thomas’s” in days lost and not for preparatory exercise strikes one as rather a big chunk cut out of the drone’s life. The words, “the queen and drone fall nearly to the ground,” are provocative of suspicion. They sound so dreadfully like there were “cut out without causing a little sensation.” To literature, the whole fall of less than 30 feet seems very inadequate to give time for twisting off a strong ligament by rotation. Page 181.

**BEE-KEEPING AND PIANO-PLAYING.**

Easier to learn apiculture than piano-playing, eh? Well perhaps. There’s this about it—if you learn bees you suffer the torments yourself mostly; if piano is your choice the agony falls to the neighbors. Page 182.

**ADULTERATION OF SUGAR COMMON.**

Referring to Mr. Cowen’s letter on page 211, I guess I shall have to admit that the adulteration of granulated sugar is getting to be common. Am using some now very pleasant to the taste, but nevertheless as theh there might be an awful amount of it. The good men and the straight-out sweet and nothing else do not seem to be there.

**BUCKWHEAT BLOOM EARLY.**

West Virginia, on page 185—what does he want buckwheat to bloom July 1st for? Perhaps it might be well to tell him that buckwheat made to bloom abnormally early is pretty sure not to yield honey to amount to anything—pretty sure not to produce very much grain, either.

---

**The Home Circle.**

Conducted by Prof. A. J. Cook, Claremont, Calif.

**"THE BEST CROP."**

At one of our recent farmers’ institutes, a lady had a paper on the subject of “The Best Crop.” Of course no one could know whether she was to treat of beans, barley, or beets. We should find in any of these, if any at all, was to be devoted to the children. And surely she was right. The boys and girls do certainly form the best crop, not only of the farm, but of any home be it in city or country. I wonder if any of us realize this fact as we should. How many of the children use tobacco; how many smoke the harmful, not to say deadly, cigarette; how many seek amusement in the saloon; how many use profane language; how many tell or listen to the vulgar story, and often demean themselves by telling it themselves. Oh, how happy we are if we can keep our dear ones from all these de-basing habits! We engage men to spend days, and keep a close watch of them all of the time as they break a favorite coat. Yet do we all give time to the children, and agree that as they are being formed? Do we give an hour or two on each Sunday, perchance walking in the field, park, or woodland, and calling their attention to the many beauties that are scattered so thickly all about us? The father and mother who have not had these pleasures have mist one of the rarest sweets of life. The children who have not in their early, tender years enjoyed this rich fellowship, have had a most valuable part of their life left out.

I do not think there is any one thing in my whole life that I recall with more satisfaction and genuine pleasure than I do the Sunday walks with the dear wife and children. I found, it so easy to beget in the children a love even for the creeping, crawling insects generally admired and even the snakes, the frogs, and the caterpillars. Who has not admired the stanza from the poet?

"He prayseth best who loveth best,
All things both great and small;
For the dear Lord who loveth us,
He madeth and loveth all."

Can we help our children more than to lead them to love and admire God’s handiwork at the very threshold of their lives? If we can couple with this in their young minds a full appreciation that all the good things are from God, we have given them to an invaluable possession. I would rather my children had a perfectly realizing that there was about him, loved him, cared for him, and was the Great Giver of all the beauty about us, than any other one thing. No father should be so busy that he could not take these Sunday walks with the dear children.

Is it not also true that the club or street-corner talk should be very valuable indeed if it rob the children of the time and sympathy of the father? How many fathers carry a life-long burden because of wayward children! I just heard a story of a woman who had a son close by us, who has also been a life-long minister of the gospel, whose son has dipt into all the bad things that mar the life and character. I have known the boy, and his face tells the story of all his reckless days. This same sorrow might very likely have been avoided had the father found time during the boy’s early years to have taken walks, read to him the Youth’s Companion or other good paper, given him some chickens, and then taken the interest in him that is always so pleasing to the boy or girl.

I remember once in a lecture before the Chautauqua Association, in speaking of inviting in children a love of Nature. I said that I feared at the same time was as an assertion. I said that I believed that up to twelve years of age, if Barnum’s “Greatest Show on Earth” were to come our way, and I had said to my boy and girl, “We will take the day off, and go to the circus or for a walk in the woods—which shall it be?” I believe that they would have chosen the woods. As I thought of the circus, the fine horses, the rapid and dizzy riding, the wondrous jumping, swinging and wrestling, I feared that I had perhaps make a reckless statement. After the lecture, I am my grown daughter who was present, if I had done so. She said, “No, indeed. I am sure we should have gone for the walk.”

It is assuredly true that the children are the best crop of the farm. Time, effort, energy, spent in keeping them interested in good things they can only do so. We often wish that I had money so that I could put the Youth’s Companion into every home of the land. Next to our personal attention, nothing will help so much to lift the children from all that is mean and unseemly as good papers and books. These are now so cheap that no home need be without them. We have had many illustrations here at our college that the boy or girl of good stuff need not even go without a college education. Energy, determination, vim, can even give this best of riches with no outside help at all. How much easier to secure the good book, the good paper, for the children.

**CHILDREN IN THE CITY.**

How many of our good friends live in the close quarters of the city, perhaps in a flat where a few feet of ground in front and back form the only exclusive places for the children. The children must have air and sunshine. Without these, palor, weakness, disease, are sure to come. Left to the outside air and sun, many people would be the better for their presence. Sabotage, rudeness, often even the vilest vulgarity will be poured into their ears. Surely, no mother can contemplate this without a dread and horror that will do its utmost to bring invention to the rescue. I have a friend who has just this problem to solve. Her husband’s business makes it almost impossible to escape the narrow limits of the city flat. The back yard is about 30x40 feet. This is boarded up so as to shut out the children, and give them their space as the best good of the children. Lovely vines have converted the rude board fence into a thing of beauty. A hammock, screen to protect from the sun, pile of clean sand for the children, sounds and out of doors. The cloth some clay to be used in moulding, blocks, brick, etc., all make that back yard a veritable paradise for the wee children. Other children in the neighborhood long to gain admittance to this little fairyland, and are themselves moulded into goodness as they know that the most perfect conduct is the only key that unlocks the door.

This mother has not only solved the immediate problem for her own children, but she has a center of good influence that she is through the Youth’s Companion, the open door to a better condition of the city. Whenever the busy mother can do so, she takes the children to the parks and there talks of birds, insects and even creeping things, for she learned to know and love all those things when she was little, and she has some bits of knowledge over to the eager children which have come to bless her home.

A friend at my side asks, “How about the coming years?”

BEE MACHINES, SECTIONS AND ALL BEE-KEEPERS’ SUPPLIES.

AMERICAN BEE JOURNAL

May 2, 1901

This mother has thought this out, and has planned to live so economically and plan so well that as the children get older they can move into the suburbs, and there with garden, poultry and bees, the children may have that which will not only give them wholesome employment, but which will also interest them in the real, vital things of life, and thus prepare them for the stern duties which will come in their later years. We see that this mother has devoted a great deal of time and thought that she may give her children an abundance of the good things, and keep from them anything that she should poison the character and vitiate the life. Ought we not all to do the same thing? Ought we not for our own good and also as a patriotic duty? Mr. Woodward, so well and favorably known in the State of New York, told me that no man should be content to leave this world until he could leave behind children who were brighter and better than he. I believe he said truly. We can hardly hope to realize this happy experience unless we give earnest heed to this "best crop of the farm." INFLUENCE OF GOOD EXAMPLE—TRUTHFULNESS AND HONESTY.

I believe the best cultivation that can be given this crop is that of wholesome example. How few of us that are parents are careful enough in this respect. Our words are not such as becometh the Gospel of Peace or our high position as parents. The rude 'slang,' the profanity, the sarcasm, the thoughtless all, these should be kept away from the home circle. Ought we not to form an idea of just what we want this crop to be? Then we might use a more careful, prayerful effort to strive to make our own lives conform to this ideal? The most blessed thing in character is absolute truthfulness. Are we careful enough that there shall be no lie in our lives? How quickly even the little deception will be detected by the child. If such deception beget in them a lack of genuine truthfulness, then we have sown the biggest tares in our best crop of the farm.

Next to truthfulness, honesty holds first rank. The child, the man, the citizen, are not what the home, the community, the country, stand in pressing need of unless transparent honesty gilds the life. Who has not felt grieved to the quick as they have heard the father, perhaps about the tea-table, tell with great rejoicing how in some way during the day he has cheated a stranger or neighbor to the tune of many dollars? Oh, that he could know what a black eye he was giving to the forming character of the child as he tells of any such experience as that given above.

KEEPING LITTLE HANDS BUSY.

I think one of the most helpful things in the best development of this "best crop of the farm" is the keeping of the little hands busy. This is one of the things that teach our farm boys and farm girls. How difficult always to furnish the city boys with wholesome employment. On the farm it is not difficult at all. If we give the boy the bees, the chickens, or the calf, which he is to care for, we will make this labor at the same time an occasion for economic truths, and for a young boy to learn to defray their expenses in getting a college education. When I was a boy, my father always kept me at work. While I was rarely ever late at school, I never got there much before the opening hour, and taken away from my work then, at times at least, that my lot was a hard one. How many times since have I blst my good father's memory as I have learned to appreciate his wisdom, and have seen its fruits in my own life.

The parent who succeeds in developing habits of industry and a love of honest, honest work in the child, has certainly wrought in the very best way to secure the best fruit of the best crop of the farm.

Handy Little Apiarian Tools.

I enclose a drawing of a little tool that I made for fastening "starters" in sections. The cut is about two-fifths of the full size, and will do the work as fast as any tool I know of. I use two of them, keeping one in a dish of hot water on a small kerosene stove, changing when one gets too cool. There is no wasting of foundation by melting, as with most of the high-priced, patented tools. I made mine out of a broken saw blade, but a piece of heavy tin doubled, with the ends toward the handle, will answer every purpose. The point should be rounded, not sharp, to avoid cutting the foundation in two.

I also have a small scraper for scraping propolis from sections, supers, etc., made in the same way, of steel, only the point is turned down and kept sharp. This beats the Golden section cleaner out of sight. I use it to clean the tops of the sections before removing them from the super, and can do the whole 24 in the time it used to take me to do one with the Golden method.

Reading an article in the Bee Journal some time ago, suggesting that bee-keepers tell each other of any little thing they think might be helpful, is what prompted me to submit the above notes.

A. F. Fouts,
Mitchell Co., Iowa.

Pickled Brood—Introducing Queens.

Pickled brood, in this locality, is of little moment. Colonies of Italian bees are not troubled with it. I have observed it among blacks and hybrids, simply by introducing an Italian queen. When her bees predominate the disease disappears. I am quite sure that pickled brood is not a starvation disease, as newly-hived swarms, gathering honey and pollen freely, have shown it in their first brood.

I successfully introduced over 50 queens, both home-bred and from a distance, to colonies in almost every possible condition, during the season of 1900. I used the Miller cage, pasteboard tack over the candy. The pasteboard must be a little narrower than the hole in the hive with such a rush that a number of them accumulate in front of the hive on the ground or on the slitting-board. I would like to ask the following questions of just as many bee-keepers as will answer them: the "Old Reliable," and when the answers are published I will give my plan with some photographs in this Journal:

1. When a swarm issue do the bees pour out of the hive with such a rush that they can not take to their wings fast enough, and consequently pile up in front of the hive to the amount of a half pound or more?

2. When a prime swarm issue, is the queen one of the last to come out of the hive?

A. B. Ginner,
Hardin Co., Iowa, April 13.
QUEENS!

Improved Golden and Leather-colored Italians are what H. G. QUINIR years.

The Longest-Tongued Bees that I have yet measured are from the grandaughter

of the Doolittle poll. They are a quill that I can transfer just as small larva as Mr.

Prigden can move, "baby, cradle, and all," and no comb with their wax.

To keep up with the times, I have been measuring the tongues of bees from several

of my colonies, and the results have been surprising. The longest-tongued bees that I

have yet measured are from the grandaughter of the Doolittle poll. They are a quill that I can transfer just as small larva as Mr. Prigden can move, "baby, cradle, and all," and no comb with their wax.

The beek-keepers of South Dakota have experienced some of the advantages of co-operation. Supplies were purchased thru our State association. For many of our members the saving of supplies alone many times repaid the membership fee of one dollar.

Perhaps for those who will use quilts on hives nothing is so good as Dr. Miller's quilts which were used by some of the newspapers here. I say one of my neighbors who has used many of them.

I have wintered perfectly, both indoors and outdoors. E. ATWATER.

Yankton Co., S. D., March 1.

Report from Southern Georgia.

I began bee-keeping in 1867 with 5 colonies, and it was not until a few years later that most beginners do. I now have a small apiary of 25 colonies, which I run entirely for coming and going. I have a perfect market for the honey in my local market than for the extracted honey. I have 5000 bees and 800 hives on the stands in single-walled hives the yard around, and I have almost the loss of a single colony in wintering.

I hived a swarm April 5th that weighed 15 pounds, and have put them on. Our main honey-flow begins about May 1st, and lasts until about July 1st. I take off the supers about July 15th, and let them build up for winter. I lose two or three colonies every spring from spring dwindling. The weather is very mild. I suppose about 10 miles of mine. I like keeping, and also like the American Bee Journal, and think that no bee-keeper ought to get along without it.

H. T. HANZA.

Decatur Co., Ga., April 13.

Successful Cellar-Wintering.

Our bees came out booming this spring. From 400 colonies placed in the cellar last fall, we lost only 10 colonies, so I think we will have some bee-business this season. Our imported queens wintered very well, and escaped the floods with plenty of good in their stores. Many of the bee-keepers in this section report heavy losses. We attribute our success in this respect to having plenty of good food, good cellars, and last but not important, good, young, prolific queens.

L. P. BROWN.

Richland Co., Wis., April 17.

Rendering Bee-wax.

Having seen and read a good many articles in the American Bee Journal about rendering wax, I felt I needed more bee-wax and am hereby asking if you have bee-wax—exactly, but at a slow process unless one has but a few colonies. I have tried a number of different ways, and I think the following is "king of all," both for rapid work and ease:

I have made what I call a "jack press." It is 10x16 inches, inside measure, the posts and bees are 3x6 oak, the bottom is made of 3x6 inch planks, and the ends and sides are made of one-inch pine with one-inch slots left on each side of the bottom, these being covered with wire cloth so that the wax can pass through.

I have another plank to fit loosely in the press, which I set jack on, and on a jack with 2x10 inch screw. Set the whole thing on a large tub or trough with some water in it, and allow the wax to drain into the tub. If the wax be entirely hard, put the wax and a little cold water in a pot, boil the water until it boils, and boil the wax until it boils. I boil about 25 or 30 combs at a time in an old wash-boiler, having it as hot as I can get it, and have the wax in the press all ready, pour the boiling wax into it, fold down the sack, lay on the loose plank, screw down the jack, and in a few minutes the wax is reduced as dry as polon that comes from a cider.

After having done this I refill the boiler, and let the bees work over the hot press, pressing it as fast as they can.

Prospects for a Good Honey Crop.

I put 11 colonies into the cellar last fall, but they were not very strong, so I lost 4 of them. Last season was a very poor one for bees in this part of the State, but the prospects are for a good honey crop this year.

ALBERT GOETSCH.

Dodge Co., Wis., April 19.

How the "Robber-Bees" Were Quelled.

I had a little experience once with bees when I first commenced in the bee-business. I had read up a subject of bee-keeping, and was impressed with the importance of having a stationary infestation of robber bees and manage an apiary. I soon started out in quest of bees, and purchased two hives in box-hives. This was in early spring. I kept close watch to see that all was well with them, and everything went well the first day. The second day trouble did not arise until the queen was full of honey and bees, the other one was light in both.

About 1 p.m. I noticed there was something wrong in the apiary. I soon discovered what the trouble was—they were robbing my honey. I thought how very much I would have to learn to manage a bad case of robbing like the one I now had to deal with.

I sent one member of the family after straw, another after water, and myself after the honey. I soon discovered what the trouble was—a strong and vigorous colony which was being robbed, piled high with straw, and the sprinkler running full time. I knew what I wanted, but the bees kept piling into the hive, and none came out, but soon all was quiet. I had conquered them. I decided then and there that I was well informed in all the branches of bee-keeping.

I didn’t learn my mistake till the following day, when the bees again (as before) came out for their daily play spot.

A. E. WILLCUTT.

Value of Honey as Food.

"Comparatively few to-day know the great value of honey both as a food and a medicine. Were its value as medicine thoroly known, it would displace in the market, in some measure, all our domestic remedies or quack compounds now depended upon by them as ‘cure-all.’. If one of the bee-keepers in Minnesota would put together a series of articles for his local weekly newspaper upon the value of honey for food and medicine, it would do a great deal to supply what would require a much larger quantity than is now produced."

This says a writer in one of our agricultural papers. While there may not be in the claims made, all the writer thinks, yet in them is something worthy of thinking about. If honey is really the good thing we bee-keepers
Tennessee Queens!

Fine lot of Choice Tested Queens reared last season, dispatchable, and select golden queens, reared 24 miles apart, and mated to select drones, $1.50 each; nestless warranted. CAREER AND CHARACTER OF ABRAHAM LINCOLN.

An address by Joseph Choate, Ambassador from Great Britain, on the career and character of Abraham Lincoln—his early life—his early struggles with the world—his character as developed later on—and his life and his administration, which placed his name so high on the world’s roll of honor and fame, has been published by the Chicago, Middletown, Paul Rail-

way, and may be had by sending six (6) cents in postage to F. A. Miller, General Passenger Agent, Chicago, Ill. 18A3t

think it is, are we doing right in not publishing the matter more? Are we not "hiding our light under a bushel"? Here is the time—by letting it shine brightly all the time, we might honor our calling by leading others to partake of the good which comes to those who hold forth the rays of the bee-keeping sun—honey—G. M. DOOLITTLE, in the Progressive Bee-Keeper.

Load a Worker-Bee Can Carry.

A Stray Straw in Gleanings in Bee-Culture says:—"A worker, according to A. Astor (Rev. Int.), can carry about an eighth more than its own weight when honey is given to it. The maximum load of nectar brought in by (their) foundress (Rev. Int.) is 150 grains (a little more than three-fourths its own weight); and from then to Aug. 8d the loadings show a decrease to 25, 15, 10, 0 and 10. [It appears, then, that a bee can carry more of honey than it can of nectar—nor larger in bulk, but greater in weight. These figures are very interesting.—Editor.]

A Queen Between the Lips.

A pointer for those who, like myself, are fond of honey—bees to remember.

The hive is all open; I hold in my hands the frame she is on, but I have no cage! It is a long way back from the hive. But the sun is hot, and robbers have found us. If I place the frame back into the hive in order to go and get the queen, even the best of the 12 bees can do nothing so long as this frame is in my hands. I want that queen! What shall I do? Simply place the hand, carefully between the dry lips, close the hive, and then go and cage her. See?

I hold cell, root in the same, very easy. Quotations, "FAIRSTEAD," in the American Bee-Ceeper.

Good Apiarian Advice.

Produce what your market calls for; this will be both comb and extracted honey. Some customers want the comb, others the extracted honey.—please both. Bottle nothing but first-class honey. Furnish this to the grocers around you to such an extent that as many as may wish to do this will be able to purchase our goods. Call all your wits into play, and remember, it is as honorable to sell honey as to sell wheat or potatoes. Give good weight, and you will soon work a good trade, and get retail prices for your goods.—F. P. CLARK, in the Bee-Ceeper's Review.

Railroads Against Comb Honey.

Referring to the fact that the Grand Trunk railway in Canada has ruled out a class of honey as of less weight, and to the information given in a recent number of this journal as to contemplated action on this side, the editor of Gleanings in Bee-Culture expresses himself in the following vigorous style:

I regard this as a most serious matter. I can not think of anything that would handicap bee-keeping any more, unless it be foul or black brood, than to have the railroads practically refuse to handle comb honey. We can not and will not pay two or three times the price by quantity as by express; and if the new freight-classification should go thru, we could not afford to send these honey products. Retail dealers would be totally unable to dispose of their product, and the industry would not

**MONEY AND BEEWAX**

MARKET QUOTATIONS.

CHICAGO, April 18.—Choice grades of white honeycomb sell at 6c, and there is surplus in sight. Other grades of comb sell fairly well ranging from 2c to 25c. Buckwheat, 28@25c; light amber, 78@80c; dark amber, 100@115c; buckwheat, 100@115c. Extracted, dull, and prices very weak, with the exception of some fancy extracted comb, grades which is quoted at 780, amber, 60c; dark and buckwax comb, 70c. R. A. BURNETT & CO.

BUFFALO, April 18.—Fancy white comb, 150@160c. Poor, dark, etc., 89@95c, as to grade. Demand good on fancy. Bee wax, 200@240c old home. BATTFERSON & CO.

OMAHA, Apr. 25.—There has been no change in the market this month, and there is fair demand for all grades. Fancy white is still selling at from 90c to $1.00, $1.25 to $1.40, 130@140c amber at from 126@135c, buckwheat, 105@115c, according to quality and style of packages. As to extracted, the market is quiet and inactive, and a certain amount will have to be carried over again. Prices are declining somewhat, and what is the honey not moved in large lots will be knocked down. We quote: California white, 87@90c; light amber, 65@75c; other grades and Seathers, 65@75c per gallon. Bee wax very firm at 285@295c, and for exceptional fine you will find 300c.

HILDEBRAND & SEIGLEIN.

CINCINNATI, Apr. 18.—The demand for comb honey is nearly over. The stock of it also well taken. There is a fair demand for extracted, in fair demand: dark sells for 55c; better of 65@75c; Extracted, 75@80c. C. H. W. WEBER.

KANSAS CITY, Apr. 18.—There is very little honey offered, and the demand is steady, selling from 25c@30c. Buckwheat is firm, and no amber on the market at this time. Extracted, no change; white, from 55c@65c; dark amber, 75@80c. It is reported that there will be little on this market that could be sold from 75c@85c. Bee wax scarce and demand good, at 260@280c. W. R. CARSON.

Successors to C. C. Clemens & Co.

ALBANY, N.Y., Apr. 19.—Honey market quiet. Light supply and light demand now. The stock in well cleaned out, so we boldly hold honey to carry over this season.

H. R. WRIGHT.

BOSTON, April 4.—Fancy No. 1 white in carloads, $1.10 per lb. No. 1, 1.50@1.60c per lb., fairly good demand. Absolutely no call for dark honey this year. Extracted, white, 88@94c; light amber, 78@85c; Buckwheat, 25c.

BLAKE, SCOTT & LEE.

SAN FRANCISCO, April 2.—White comb 120@125c amber, 95@100c; buckwheat, 90@95c. Extracted, white, 68@75c; light amber, 49@56c; buckwheat, 25@28c.

BEE WAX.

Despite general expectations and contrary to experience of previous years, new honey is reported on the market. Only a fair quantity of honey is reported from Ventura county 6 cts. is asked, but this venture is probably not worth 20 cts. inquire offering in moderate quantity, both comb and extracted, mostly amber.

WANTED By young woman, position to assist in apiary.

MISS WHITELY, 1915 Prairie Ave, Chicago, Ill.

**Red Clover Queens**

**LONG-TONGUED BEES ARE DEMAND NOW.**

ONE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2; or, one Tested Queen free as a premium for sending as FOUR new subscribers with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veiling or smock. They stored red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—first come, first served—beginning about June 10th. It is therefore important that they be taken at once, since there can be no guarantee that such classification resided in the same order. Why, our Association could better expect every member to do whatever he can to help them than have such a foolish, unreasonable, and unlawful protest against the industry. I am sure that our worthy general suppliers will take such action at once. In the meantime, the Ontario Bee-Keepers' Association in Canada is about to start, and we have to have that in the same list, the Grand Trunk railway resided. It is apparent that the proposed action on our side of the line was instigated by the foolish resistance of the Grand Trunk on the other side, and as long as it stands thus, so long will it be a menace to us.
AMERICAN BEE JOURNAL
May 2, 1901.

We have a Large Stock on hand and can ship promptly.

SEND US YOUR ORDERS FOR
Hives, Extractors
OR ANYTHING YOU WANT IN THE "BEE-KEEPING LINE."

WE MAKE ONLY THE BEST.

Our Falcon Sections and New Process Foundation are ahead of everything, and cost no more than other makes. New Catalog and copy of The American Bee-Keepers free. Address,

THE W. T. FALCONER MFG. CO.,
JAMESTOWN, N. Y.

We, W. M. Grooming, East Nottingham, N. H., carries a full line of our goods at catalog prices. Order of him and save freight.

LEARN TO SING AS HOME by my new method of teaching. With my complete system you will have your voice in any key. Send 25 cents for samples. No obligation. Address:

Prof. M. W. Whaley, Kalamazoo, Mich.

Please mention Bee Journal when writing.

SWEET CLOVER
And Several Other Clover Seeds.

we have made arrangements so that we can
We can seed of several of the Clovers by freight
or express, at the following prices, cash with
the order:

5 lb. $1.00 10 lb. $2.50 50 lb. $15.00

Sweet Clover (white) . . . . . . . . 75c
Sweet Clover (yellow) . . . . . . . 85c

Aikakesh Clover . . . . . . . . . . 75c

Japanese Backwheat . . . . . . . . 75c

Prices subject to market changes.

Single post 25 cents more than the 5-pound
rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for carriage, if
wanted by freight, or 10 cents per pound if
wanted by mail.

I ARISE
To say to the readers of the Bee Journal that
DOOLITTLE...

has concluded to sell QUEENS in their season
during 1901, at the follow-
ing prices:

1 Untested Queen $1.00
2 Untested Queens 2.50
3 Untested Queens, 2.25
1 Tested Queen . . . . . . . . 1.25
2 Tested Queen . . . . . . . . 2.25
3 Tested Queens . . . . . . . . 3.00
1 Selected tested queen 1.50
2 Selected tested queen 2.50
3 Selected tested Queen 4.00
Selected Tested Queen, last year’s rearing 2.50
Extra selected breeding, the very best . . . . . 5.00

Circular, free, giving particulars regarding
class of Queens, conditions, etc. Address,

G. M. DOOLITTLE,
11A264
Borodino, Onondaga Co., N. Y.

24th Year Dadant’s Foundation. 24th Year

We guarantee satisfaction. **

Why does it sell so well? **

PATENT WEED-PROCESS SHEETING.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BEE-KEEPERS’ SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs

for sale at very low prices.

LANGSTROTH on the HONEY-BEE—Revised

The classic in Bee-Culture—Price, $1.25, by mail.

Becswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

$15.00 and $25.00 Queens
Having a Measured Tongue Reach.

The call for queens of our celebrated $20 imported mother has been so great that we have decided, in addition to the $2.00, $4.00, and $6.00 grades of this stock, to offer some $10.00, $15.00, and even $25.00 of this same blood. But these prices are for tested queens, the tongues of whose bees have been measured.

The $10.00 queen is guaranteed to produce bees with a tongue-measurement of 19-100.

The $15.00 queen, 20-100.

The $25.00 queen, 21-100.

These last are very rare and with one exception this (21-100) is the longest tongue reach yet secured. We reserve the right, when we do not have the stock with the tongue reach called for, to either return the money or to send the next lower, remitting the balance. It would be well for our friends to put in their orders at once, and as soon as we get the grades we will send notice. When the money is sent, the queens will be forwarded. These will be put up in the very best manner possible; and while we guarantee safe arrival in good order to any point in the United States, on any railway line, we will not guarantee safe introduction. Such valuable queens should be releas on hatching brood.

N. B.—It seems as if it ought not to be necessary to say that no one but a queen-bredcr or a large honey-producer should order these high-priced queens; but it is a fact according to our experience that beginners with only a few colonies will order our highest-priced imported queens, as such bee-keepers have no more use for such queens than a pig has for a wheel-barrow.

The American Bee Journal.
1881.
FEMININE FLICKS is exhibited by Miss Rose Kenkott, who, in the good State of Colorado, has worked up in the course of a year from 5 colonies to nearly 300 colonies, with only the textbooks, bee-papers, and her own experience to guide her. May her success continue.

Mr. F. Gent, of Wight Co., Minn., who has been offering bees for sale in our advertising columns, wrote us April 30th, when re-ordering his advertisement: "The American Bee Journal is a good puller." Of course it is. If you have any good thing to sell that bee-keepers want or need, offer it thru our advertising columns.

Mr. N. E. France, of Grant Co., Wis., writing us April 27th, says: "Prospects are for a good honey crop in Wisconsin this season. But some lost many colonies of bees during the winter. I am happy to say that, for the first time in Wisconsin now has a law to suppress foul brood. I have witnessed many times that every State had the right to control disease that is imported with no importing or sending of diseased bees from one State to another."

Three Friendly Editors are shown on the first page this week. The engraving appeared first in the Bee-Keepers' Review for March. Mr. Hutchinson had the following to say, in part, concerning those represented in the picture:

"It is a fortunate fact for the readers of these leading bee-journals, that the editors are really and truly friends. Instead of wasting their time and energies, and using up space in quarrels, in bickerings, in all pull together for the good of the pursuit in which their journals are devoted."

When the editors of the Bee-Keepers' Review last met at Madison, these editors met by appointment at the Chicago, Milwaukee & St. Paul station in Chicago, went together to Madison, and whiled away the time on the way by discussing bee-journalism—each trying to learn from the others how he might improve his own journal.

E. R. Root was called home from Oberlin College, some 15 or 20 years ago, to help his overburdened father; and, gradually, he worked into the editorial harness, until, at last, he was "given head," not only in Glenings, but in the revisions of the "A B C" book. Mr. Root has had exceptionally good advantages for becoming a first-class bee-keeper, having been brought up with the bees, and in connection with the largest factory there is devoted to the manufacture of bee-supplies. If I were to point out his leading characteristic, or, at least, the one that has had a great deal to do with the building up of Glenings, it is this: it is his affinity—the faculty of making and keeping friends. An editor has many times to disagree with his colleagues, but Mr. Root seems to be able to do this without giving offense. There is a great difference between the way people say, "I disagree with you," and the way they say, "I disagree with you," and explaining to him where he has made a mistake. Mr. Root takes the latter course.

About the time that Bro. Root began working on Glenings, I found a reproduction of a motto on a button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; one dozen, 50 cents, to the office of the American Bee Journal.
Strenuous Queen-Rearing is the subject written on by Mr. J. H. Martin, as will be seen by the report of the California convention in this number. The paper treats upon a new phase in queen breeding and distribution. We understand that the plan was almost unanimously endorsed by those present at the meeting. Mr. McIntyre made an estimate that if a bee-keeper could definitely depend upon supplying a large number of bee-keepers with queens, and without advertising and the uncertainties of the present method, that queens could be reared for 15 cents each. The members present were willing to pay 25 cents each, and upon that basis the few present were ready to place an order for 1,000 queens. Upon this basis Mr. McIntyre would probably receive orders in his own county, and in Los Angeles county, for over 5,000 queens; but not being prepared for such extensive queen-rearing just at present, the matter is under advisement, meanwhile others are thinking of entering the field and working upon this plan.

Now the questions before the fraternity, or rather before the queen-breeders, are, Can good queens, such as Mr. Martin’s paper calls for, be bred for 25 cents each? Can a queen-breeder rear from 5,000 to 10,000 good queens per year? Or, Mr. Queen-Breeder, how much will you charge per month for your services while rearing queens for from 50 to 100 bee-keepers?

The object in adding the foregoing is that a healthful discussion of the matter may be brought out. Mr. Martin thinks his plan is the right one for improving the working qualities of a large number of colonies of bees.

Are Old Combs Objectionable?—It is a fact that fashion seems to have at least a little to do with practices of bee-keepers in different parts of the world. In this country it is the fashion to continue to use brood-combs when many years old, while in other countries they are considered objectionable when ten, five, and in some places three years old. The rejection of old brood-combs comes from the belief that the cocoons left by successive generations of young bees make the cells so small that bees reared in them can not attain their full size. A few in this country have said that they found bees reared from old combs were a third smaller than others, but others say they can see no difference when the combs are 20 years old or older. One writer in Gleanings in Bee-Culture argued that bees must necessarily be smaller because the cocoons left from year to year do not leave room for full development. But if that proves anything it proves too much. Old combs may be found in which the septum or wall measures ⅛ of an inch, and it was shown in Gleanings in Bee-Culture that if the amount of cocoons left on the cell-walls was the same as at the bottom, the inner diameter of such cells would be so reduced that instead of measuring 5 to the inch it would take 13 of them. It was shown in the Illinois State Apiary of the Illinois State Apiary, and if honey is stored on them in to weigh as much as an ordinary worker. No one pretends that such dwarfing ever takes place.

Some worker-comb 25 years old was measured by E. R. Root, and he found that while the septum was ⅛ of an inch thick the cell-walls were not materially thinned. It seems that while the bees leave the bottoms of the cells undisturbed they continually remove the cocoons from the side-walls, so that by drawing out the cell-walls a little the cell is made as large as ever. From this drawing out of the cell-wall it happens that very old comb measures an inch in thickness, while comb newly built measures only ⅛.

Another item that should not be disregarded is the preference of the bees themselves. Give them their choice between an old black comb 20 years old, and a fresh comb in which little or no brood has ever been reared, and they will promptly choose the old comb, whether it be for the rearing of brood or the storing of honey. It is also claimed that bees winter better on old than on new combs.

Honey-Adulteration in Illinois.—From the First Annual Report of the State Food Commissioner of Illinois—1884-1885—we take the following as written by State Analyst E. N. Eaton last December, which bears directly on this subject:

Honey.

Pure honey may be defined as the nectar of flowers, transformed, and stored in the comb, and if pure bees. Extract of strained honey is the same article removed from the comb by man, usually by centrifugal force. Comb honey can only be adulterated by the bee which seems to have a patent on cupping the cells. Extracted honey, next to vinegar, is more universally adulterated than any other staple food-products.

In Minnesota, before the honey clause was added to the Food Statute, about 20 per cent. of extracted honey proved to be adulterated. In Illinois about the same ratio of adulteration was proven to exist. Last year a committee acting for the National Bee-Keepers Association, secured a large number of samples in Chicago. In all at the time employed in commercial use. I examined the samples for the Association, and found that more than 50 per cent. were adulterated. The present month finds extracted honey again selling during the winter trade. Inspector Mrs. Frank Hubbard has visited many stores in Chicago, and reports very much less extracted honey this year than last. A recent law requires the enforcement of State law requiring the labelling of adulterated honey, thus driving a dishonest competitor from the market. While none of the samples taken this winter have as yet been analyzed, many of them are of those brands which proved genuine in former analyses.

The most common adulterant of honey is glucose, wine, sugar and invert sugar is possible and sometimes practiced. The adulteration thus far discovered in Illinois is mainly confined to the market. The Illinois Food Commission is doing a good work for everybody in this State. There are still some weaknesses in the present law under which the Commission is operating, which, when removed, will tend to make their efforts still more effective in the future. We hope the strengthening amendments will be approved during the present session of the State legislature at Springfield.

A Woman With 500 Colonies.—Gleanings in Bee-Culture has a report from Lydia Crawford Harris, who last year from an apiary of 160 colonies obtained 160 50-pound cans of extracted honey, and 171 cases of comb honey. She also has two other apiaries—in all 500 colonies. If something is not done to stop this sort of thing there is no telling to what it will lead. Instead of being the down-trodden, submissive creature that a properly constructed woman is expected to be, Mrs. Harris boldly declares her independence of the "lords of creation" by saying:

"As we women in Colorado enjoy all the rights of voting, from the lowest county officers to the President of the United States, I propose to operate these yards with women help.

"As a comment on the above, Editor E. R. Root adds this:

"If the right of franchise has this effect on the gentler sex, let's give the women a chance. If the women of the land could vote she would be less of a sibyl best suited with knowledge for the work of the world and a woman of her calling for the women of the world."

A Smoker With Double Bellows has been shown in Gleanings in Bee-Culture which operates so that a puff is given as usual at the pressing together of thumb and fingers, and another puff as they separate; but the two puffs give no more smoke than a single puff of the ordinary smoker. A Stryaw Straw suggests that a smoker could be made to give a perfectly continuous blast by having bellows after the fashion of a melodeon, allowing no possible sucking of smoke into the bellows, but there would be a loss in the strength of the blast.
Convention Proceedings.

The 11th annual convention of the California State Bee-keepers' Association was held in Los Angeles, Feb. 25 and 26, 1901. There was a small attendance, but all were hospitable and kind toward the visiting delegations. Secretary McIntyre explained some of the advantages of the new State Law in the interest of bee-keeping, thru the efforts of Assemblyman R. M. Clark, of Ventura, assisted by other southern legislators. The new law reads as follows:

AN ACT
To promote the Apicultural Interests of the State of California by providing County Inspectors of Apiaries, and defining their duties and powers, and the manner of enforcing the same.

Secretary McIntyre suggested that every member of the Association consider himself a committee of one, authorized to investigate honey adulteration in their respective districts.

ELECTION OF OFFICERS.
At the time of the election of officers the following were chosen to serve the coming year: President, G. S. Stubblefield; vice-presidents, H. E. Wilder, G. W. Brobeck, Robert Wilkin, E. A. Roney, and T. R. Canady; secretary and treasurer, J. R. McIntyre, Sespe; executive board, J. H. Martin, E. Hart and G. W. Brobeck.

A general discussion of the affairs of the bee-keepers' extension, which has a practical interest in the state, was made, and emphasized the need of co-operation among apiarists.

CONDITIONS IN LOS ANGELES COUNTY.
President Brobeck, of the Los Angeles County Bee-keepers' Association, stated that the local Apiary is on the decline. There were a few colonies of bees that had greatly decreased the number of colonies. Four years ago the estimated production was 4,000,000 pounds. Since then 75 percent of the bees have died. This season, however, is so far much more favorable than the season four years ago, and therefore there may be a very fair yield, notwithstanding the decrease in colonies. Most of the apiaries in this county are situated along the lower mountain sides, from San Fernando to the eastern county line, and in the hills around San Pedro.

T. O. Andrews, of Orange county, described the state of the honey-business along the Santa Ana river, where he has owned several apiaries. Seven years ago he took 18 tons in 1852 colonies, but the rain and climate continued drought which had greatly decreased the number of colonies. Four years ago the estimated production was 4,000,000 pounds. Since then 75 percent of the bees have died. This season, however, is so far much more favorable than the season four years ago, and therefore there may be a very fair yield, notwithstanding the decrease in colonies. Most of the apiaries in this county are situated along the lower mountain sides, from San Fernando to the eastern county line, and in the hills around San Pedro.

Strenuous Queen-Rearing.

In these twentieth-century days we hear much about strenuous living and working. I suppose strenuous is only another term for high-pressure, and we have had high-pressure potters rearing, high-pressure poultry rearing, high-pressure commercialism, and high-pressure many other things; but I have never heard much of high-pressure bee-keeping.

High-pressure is, however, too much out of date to apply to twentieth century bee-keeping, and "strenuous" is the term; and I have an idea that, to commence from the root of the matter, we need a more strenuous queen-rearing.

Let us consider the subject. During the past season I found a strain of bees in the apiaries I was managing that were so far superior to the other that, had they been of any strain, their queenly products, in that colony, our honey crop would have been increased by several tons. The discovery that this strain were such good rustlers for honey was not made until the season was well advanced; and now, in order to help them benefit from the hard times that had gradually diffused thru the whole apiary.

When I find a strain of bees like those I have mentioned I am impatient to get them a queen up to that standard, and I will need several when I want them, and the lack of three is likely to ruin them when my bees are devoted to the extractor or at other work. In fact, I am strenuous at something else, and need an extra-strenuous plan to supply the queens.

I think every bee-keeper present has observed that not one apiary in one hundred is properly queened, and I think we all have a dim sus...
tion that our own apiaries are not up to the standard we desire. We hear of golden yellow queens, leather color, long tongues, and even $100 queens. To make a good start we should like one of those $100 queens. But until the time comes when we can afford one, our plan will finally conclude to send for a dollar queen, and that is about as far as we get this year; but next year, if we have a big crop of honey, we will do better. Our dollar queen may be good, bad, or indifferent; and, whichever it is, we do not get much out of her.

Then you know that queen-rearing has become a great science of late years. All the authorities now agree that the number of workers, the quality of the workers, and the size of the colonies are governed by the number of queens, the quality of the queens, and the size of the queen cells. Then we have the problem of making queen cells by the peck, and queens by the quart. A great load seemed to be lifted from my mind, and I formulated the following more strenuous plans for queen-rearing.

In the first place, every bee-keeper needs the very best queens that can be reared—best in hardiness, prolificness, and notably in the honey-gathering qualities of her progeny. And in the second place, there are but few bee-keepers who have the combination of qualities that will insure their success in modern strains scientific queen-rearing. But the number of bee-keepers in a given locality turn their queen-rearing over to an expert in that line of work. A contribution from each bee-keeper interested would enable the expert to commence operations with the best available stock. Each bee-keeper in this district should agree to take a certain number of queens per annum; and, having a definite number of queens rear to, and a large enough colony to support the experiment, the expert could then, by a minimum cost to the bee-keeper, and at the same time with a good profit to himself.

A person devoting his entire attention to queen-rearing will strike to improve his stock, and his patrons will receive the full benefit. But in the same case this would have an influence in keeping the stock up to an approved grade.

The idea of sending for a breeding-queen and rear daughters, granddaughters, and great-granddaughters from her, and trust to a promising mating with our drones. This is another system that is justified to control the mating of queens with selected drones, and the bee-keepers in this district would get queens only one removal from the original, or daughters, and from the rear to the ultimate case. Hence an expert hand will dilute the blood too much by the many removes from the original stock, and this would be entirely avoided thru our expert queen-rearing station.

This plan is in line with the division of labor which at present is recognized as the most effective way for accomplishing great results; and if the experiment is successful, the bee-keepers should readily for this advance in their methods of management?

I will leave the question to you for solution, believing that, if it is determined, then I feel the honey-producing power of our colonies will be advanced many fold.
Do Bees Help to Spread Pear-Blight?

By Prof. A. J. COOK.

Our good friend, J. H. Martin, so favorably known to all beekeepers, writes me from his present home as follows:

"I herewith hand you a clipping from one of our local papers. The subject of bee-keeping and the news from Kings County:

As I understand, the blight is in the blossoms and so it is possible that it is spread by the bees. Would it not be well for you to comment upon this very important subject in the American Bee Journal and give us the truth of the matter?"

The following is the clipping:

"The supervisors have a novel question under consideration. It is whether bees are responsible for the spread of pear-blight, and what steps will or can be taken in the matter. W. Motheral and J.

F. Tilton, Horticultural Commissioners, gave their opinions on the matter. Mr. Motheral asserted strongly that bees spread the pear-blight, and should be condemned as a nuisance to the orchardist. Mr. Tilton is inclined to agree.

There is no doubt but that this question is a very important one, and certainly bee-keepers will be interested in any experience regarding it. Pear-blight has long been a serious enemy in the pear orchards in the East, and is now working its way into the West, as it recently did in California. At a recent institute, held at Banning, Riverside Co., there was no topic which called forth so much of interest as did this same one of pear-blight. The people there are much disturbed regarding the matter.

I think it was Prof. Arthur, of Purdue University, Indiana, who demonstrated that pear-blight is a microbe disease. If I remember correctly, he discovered the specific microbe, found that he could grow it in artificial cultures, and could by their use inoculate healthy trees. I think Prof. Arthur suggested that bees might be a means of spreading the disease. It is not known that the blight attacks the end of the twig and works inward toward the trunk of the tree. Of course the germs are in the sap, and might very likely be in the pollen, altho, so far as I know, their presence there has never been demonstrated. The pollen is carried to the stigma of the flower which, from its delicate sensitiveness, we would suppose, might be a very vulnerable point for infection. Thus the conjecture that bees spread the disease would not be an unreasonable one.

Until we find, however, that the microbe is in the pollen, we certainly have a right to place a large interrogation point after this theory. Mr. Motheral or any one else who speaks with assurance in this matter, would be rash, indeed. To declare bees a nuisance on this account is entirely uncalled for.

In the early spring, the swelling buds of both flower and leaf would be the most susceptible to microbe influence which may contribute greatly without the aid of insects. If insects are the medium of transportation, there are many others than bees, and removing the bees would not bring security. We know that without the honey-bee, complete pollination of flowers is impossible. A decline or disappearance of bees would be a loss in their very light, and would work them incalculable injury.

Many leading scientists of the East, especially Professors Waite and Fairchild, of the Agricultural Department, have given this matter the most careful attention. It is significant that they urge most strongly that fruit-growers take all pains to secure the presence of bees in the near precincts of their orchards. The supervisors and commissioners of Kings County cannot afford to take a back step in this important matter.

Los Angeles Co., Calif.
sour then, where they tax bees, honey on hand, corn in the crib, and potatoes in the cellar—not forgetting the poor man's crop of peas and beans, and even their garden machine.

"About a mile distant from my home lived a man—I shall not tell you his name because he is out of business for good—who kept bees, had kept them, he told me, 'for more than 70 years.' Besides he kept several queen bees about bees—their nature, and ways of doing things—that I could not make up my mind to adopt.

"Well, one beautiful day in early May this friend sent me word that he had a very large swarm out on an apple-tree near his house, which I was to catch and bring to him, as he was a large commercial bronchologist with it. Of course I went for that swarm and brought it home in my bee-box. Within a week I got three more swarms in the same way, and at the same price, and of the same kind friend.

"I had learned from 'Bees and Honey'—an excellent little book on bee-culture, for beginners especially—how to house a new swarm so that it would lose no time money-<ref>money-saving</ref> around, but go right to work storing honey for me. As compensation for knowing how, I took from those four one-<ref>dollar</ref> swarms 350 pounds of white clover honey, in sections most beautifully <ref>finished</ref> and <ref>finest</ref> all before the end of the same month.

"Some time during the following October my friend sent me for one day. The messenger said: 'Would you please come down and take some honey off the hives?' But it was already late in the day, and I was pretty sure to lose that work, in that, coming in the person of a messenger that I wouldn't do such work on such a day for the best friend I had; but that I would come down the first <ref>suitable</ref> day in the morning.

"Well, a little later I went down. My friend pointed out to me two hives, of the 14, from which he wished me to take what surplus honey I might find. The others, he thought, hadn't done anything; and most of them had no supers on, anyway.

"He showed me two sort of a hopper-shaped <ref>beehive</ref>—'The Mother-Hubbard hive'—or something like it—I think he called it. The bee-enclosure was at the small end of the hopper, which stood grandly upon four short legs, and more a conical-shaped hat on top. But that cunningly devised bee-entrance at the extreme lower end of this so-called 'hive' made such a deep impression upon my then very susceptible mind that I have never forgotten it. I am sure my friend was well pleased with both of those two hives—<ref>took</ref> especial pains to explain to me the superior excellence of that particular feature of the hive.

"'You see, Mr. Gehring,' he said, 'that bee-entrance, located as it is, acts as a ventilator to the hive, like a chimney in a house, which resolves all of the moisture in the air that passes through it, as you know. Then, again, that opening is as an automatic dirt-trap—the hive cleans itself, you see, because the dirt and dead bees fall right down thru. Besides all that, Mr. Gehring, you can see for yourself that <ref>honey</ref> can't be very easily get into the hive by way of such a contrivance as that.'

"Well, I opened one of the hives and found quite a <ref>nest</ref> of honey, mostly in small frames inside of a sort of a <ref>beehive</ref>-arrangement on top of the three-cornered brood-frames, and some of it between and above these little frames. The second hive was in the same condition. I called at the kitchen-door and got a large dish-pan, into which I put the honey. The next morning I repeated the experiment for him.

"Then I examined all the other hives for honey, but found none. The dish-pan full was the whole yield from 14 hives!

"'When I carried the honey to the house my friend—who had kept himself out of sight while the honey harvest was on—open the door and met me, as he said. He seemed to be well pleased with his crop of honey, and smilingly inquired how much I got from those four swarms. I told him, and added that I would probably get a hundred more or more from those same swarms before the season ended; and leave them enough each to winter over very nicely.

"I don't know what he thought when I told him that; but I shall never forget his reaction. He <ref>obstructed</ref> the passage to his cellar, and went with me to the kitchen to taste the honey, which we both sampled, and compared the comparative difference between his way of keeping bees and my way of bee-keeping for he sold me his whole outfit before winter for the paltry sum of $15.

"The second case to which I alluded, as I presume you remember, Mr. Bond, happened in this way:

"One of my near neighbors had two colonies of bees in his back-yard—both in box-hives. One Sunday morning word came to me that there was some sort of activity going on the hives and was hanging in a bunch from a limb of an apple-tree in the front yard, and that I could have it by coming after it.

"It was a hot day, and it was a rather poor honey season; but that swarm was filled, and finished nicely, two supers of 28 sections each. One evening I took four of the nicest sections and presented them to my Presbyterian brother, who told me it was a vote of thanks for a good deed. In my case: and that, if he wanted it, I would sell it to him for $10, hive and all.'

(To be continued.)

No. 4.—Drone-Bees and Their Utility.

Can We, and Shall We, Control their Production?

BY C. P. DADANT.

If the reader remembers my previous articles on the subject, he knows that we have plainly shown that there is a decided advantage in decreasing the number of drones in <ref>hives</ref> that are undesirable for breeding purposes, and that the advantage will be derived, in part, from a greater saving of <ref>honey</ref>. The approximate amount of profit to be earned from the prevention of drone-rearing, or from the excess of it, is, however, difficult to establish. By following the method mentioned, of removing drone-comb, and replacing it with <ref>beehive</ref>-cork, we estimate that this large measure the production of the idlers, but increase our chances of a greater production of worker-bees, which, costing no more to rear, will yet help increase the stores in the hive, or the consumption of them.

In the relation of my summer trip to Europe, and of my attendance at the International Bee-Keepers' Congress, I mentioned the discussion that took place on this very question. The matter had perhaps more importance to the bee-keepers of Europe than we could place upon it, because of the very great divergence of opinions expressed over there, by some noted bee-keepers. A French bee-lover, by the name of C. M. Weber, has written a poem on bees, somewhat after the fashion of Dr. Evans. In this work he has asserted that each drone consumes during his life, at least five grams of honey, or in other words, that it takes but a hundred drones to consume, from their birth to their death, over a pound of <ref>honey</ref>. If we take such an assertion seriously, the honey consumption by the drones of a colony would be enormous. This would mean that the drones produced in a square foot of comb could do away with 50 pounds of <ref>honey</ref>. To me it is almost to be considered as an absurdity. Some other men have gone still farther and have endeavored to prove that a drone may consume as much as 11 grams of honey in his life, which would be the equivalent of a pound of sugar. These arguments, however absurd they may appear, have caused considerable comment, and some discussion, and the experiments that were brought to light before the Congress were evidently intended to refute these too-magnified ideas of the utility of removing drones.

A gentleman by the name of Dufour gave notice of quite extensive experiments which he has made on the subject, and reported weighing 10 colonies at different times during the summer. Half of these colonies contained but little drone-comb, and the other half contained drones, while the other five contained many drones, and the total result was a difference in production of 152 pounds of honey in favor of the hives having the least number of drones. The matter had perhaps more importance on a large scale, in matters of this kind, is shown by the fact that out of these 10 colonies two were selected which were apparently of equal strength, to be weighed regularly, and the difference between the two, in the results, was in favor of the one having the most drones, but it was a mere trifle, less than a pound. So we must recognize the wisdom of this
Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, 111.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, many of which will answer them better than these columns can. Please do not ask the Doctor to send answers by mail.—Editors.)

Get a Bee-Book.

For fear some beginner may not have read them, I want to repeat the words of the editor on page 244, that should be emphasized:—

"First get and read a good bee-book thoroughly, then get the bees. Then read your book again. Then you will be ready for a good bee-paper, and, very likely—more bees."  

C. C. MILLER.

A Beginner's Questions.

1. I have a hive offered me. When I receive it what would be the first thing to do to have it in trim for the honey-flow?  
2. I have a hive that about two years ago a colony died in; of what cause I have no idea)—would it be safe to put another swarm in?  
3. The cells are filled with some kind of stuff somewhat resembling a fine sawdust, very filthy, and a few webs, but I cannot find any worms. Is there any way to save them?  
4. Wouldn't it be a good plan to winter two or three colonies, outdoors, in a kind of enclosure made of boards, back, two sides and a roof, with an opening to the south?  
5. When would you put supers on?  

WASHINGTON.

ANSWERS. 1. I am at a loss to know whether you mean a hive or a colony of bees. From your second question I should judge you mean a hive, in which case I should say that probably using more of this is necessary to get the hive is clean. If it is an old hive, it is quite possible that it may need a thorough cleaning out. If you mean a colony of bees, the first thing to be done depends upon the first thing that is needed. That might be a good way of different things, and some of them might be supposed and answers given accordingly, but even then the very one needed might be omitted.

The first thing that is needed more than all else is a thorough familiarity with a good text-book on bee-keeping. If you have only a single copy of such a book it will be well to become familiar with the contents of a text-book. When you have done that, there will be plenty of questions that will come up that may not be fully explained in the text-book, and this department will be ever ready to help out.

2. It will be entirely safe unless there has been foul brood in it. You can find out whether foul brood has been in the neighborhood. If it has not, there can be little risk in the hive. If it has, then you must try to find out whether a diseased colony has been in that hive, and act accordingly. If you use combs upon which a foul-brood colony has died, you may safely count on the appearance of the dread scourge. But the hive itself, with no combs in it, Mr. McEvoy, the foul brood expert, says may be safely used.

3. Very likely what appears like fine sawdust is pollen, and it may have been worked upon by some kind of insect. The webs are likely the work of wax-worms, but the freezing of the comb has destroyed these wax-worms that were present. If these combs are given one or two at a time to a strong colony of bees they will be cleaned up, and if not too badly riddled by the worms will do good service.

4. Such an arrangement is often used with good results. A good way is to watch the first beginning of white wax put by the bees upon the upper part of the combs and at once put on supers when it is seen. Another way is to put then on when you see the first flowers upon the plants from which you expect your honey harvest.

A Beginner's Questions.

Last September I bought some Italian bees in double-walled Langstroth hives, "Langstroth on the Honey-Bee," Cook's "Bee-Keeper's Guide," and the American Bee Journal for one year, which I enjoy very much. My wife says that I have had bees in my bonnet all winter. But I notice that I am not the only reader of the Bee Journal in my home!

May I return to the country and my bees, and there are several things that I would like to know which do not seem to be in the bee books.

1. How can I tell if my colonies are strong?  
2. How often should the hives be inspected? and how often can they be without injury?  
3. Would all the young bees be taken out? (to be out at the same time), and how long left out?  
4. How can I tell if the frames are "well-covered?" and does "frames well covered" mean all the frames in the brood-chamber?  
5. Are particular frames used for brood? and honey?  
6. Do a May queen and nucleus usually yield surplus honey the first year?  
7. Do queens go out for a flight after their wedding-trip?  
8. Is there danger of using too much smoke?  
9. How may I tell if there is a good honey-flow?  
10. How long does it take honey to ripen?  
11. When is the stripping of honey done?  
12. After being stirred, is it the best method of removing the stinger?  

NEW YORK.

ANSWERS.—1. Look at 'em and see. If in April you find combs covered with bees, and brood in them, you may brag that you have a strong colony. If you find only one or two frames covered, it is very weak. If foar, it will come out in good form.

2. That's a tough one. If you mean for the good of the bees, from one to half a dozen times a year may do. If you mean for a cross-pollinating fellow who is just beginning, three times daily except Sundays, I think is no quite rough on the bees. Fortunately, however, they can stand a good deal, and if the hive is only opened when it is once or twice rough for them to fly freely there is perhaps no appreciable harm if they should be opened once every month. At any rate, remembering how crazy-headed I once was myself and how little I have recovered from it in all these years, I'm not the man to put any restrictions on your tinkering with the bees, always providing you do it when warm.
Swarming Management, Etc.

1. I am just a beginner in the bee-business. I hived some 60 swarms last spring, and some eight this spring, and I have my first yet to lose. I always move the swarm. Now what is the difference? See some advocates during the old time.

2. I have my bees on the lowlands of the river, so I have to scaffold up for them, five or six feet off of the ground. Can I set them on the ground during the summer, then raise them in the winter, or on the high water? I have been thinking of putting them on the ground this spring.

CALIFORNIA.

Answers.—1. Putting the swarm on the old stand and moving the old hive is not done for the sake of keeping the swarm from deserting, but to throw the flying force down, making it easier to keep them above high water. I have been thinking of putting them on the ground this spring.

2. I see no reason why it will not work all right to lower the hives during the time it will be safe, and it will certainly be much more convenient not to have them so near the sky when working at them.

Perhaps Bee-Paralysis.

What can be the matter with my bees? The colony most affected has almost perished. The bees craw or are dragged out of the hive and they then crawl off in the grass to die. Some try to fly but fail. Where one lies during the night it is a yard or more long; it is all brood. They have been that way two months. I am feeding them honey. They are in Langstroth hives.

ARKANSAS.

Answer.—From the little of description that is given it is not possible to be certain, but the great probability is that your bees have bee-Paralysis. If that is the trouble, you will find the affected bees have a tremulous motion, are inclined to be black and shiny, and are pulled and dragged about by the other bees. Many cures have been offered, but none of them seem to be reliable. It is possible the disease may disappear of itself, and it is possible it may keep on with its deadly work. Some have confidently claimed a cure by making a diseased colony exchange places with a healthy one. It would do no great harm to try the experiment.

Dividing Colonies.

I have 16 colonies and wish to divide them so as to get the white clover honey. I divided last year and put one-half into each hive, but lost the white clover crop, as they were drawn by the empty hives, or on the honey-flow of foundation that I put in place of the four that I took out. I used the eight-frame dovetail hive. I wish to requeen from two queens that I got last fall. Would I better use the nucleus plan, as I can get that out of the Journal or the "A.B.C."

ILLINOIS.

Answer.—You do well to use the nucleus plan both for rearing your queens and making your increase. That will allow you to keep most of your colonies strong for storing. When you cut a colony right in two, neither half is strong enough to store a frame of honey; but you can from time to time draw a frame or two of brood and bees from a colony that is storing without very seriously interfering. Of course it does make a difference but nothing like the difference it does to take away half the force.

“"The Hum of the Bees" in the Apple-Tree Bloom" is the name of the finest keepers’s song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is sung by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies or more, one new yearly subscription, and the American Bee Journal at $1.00.

The Premiums offered this week are well worth working for. Look at them.
INSECT HONEY ON "CLOUD REST."

As told on page 196, Prof. Cook certainly found scientific "nuts and raisins" on Cloud Rest in the Yosemite—great drops of nectar secreted by pine aphides. And it was doubly beautiful news, as Dr. Gehring who discovered this marvel could hardly believe what the origin of the nectar was. Quite interesting to see that all the party pronounced it of excellent flavor. If some of us should say that bees work on aphide secretion and clever at the same time, and mix the proceeds, and that the mixture pleases every serious soul in all creatures. As to case in hand, the matter is still more complicated. Sometimes the wound is very serious and sometimes it isn't, depending upon the size of the lump of tissue pulled away with the sting. Losing the sting only should not make a bee less than losing her in a fight kills a cow. But if you should jerk off the horns horns in such a way as to carry the whole top off her head away too, she would probably die. Again, stingers are mostly aged (presumably) and aged bees in June have a very short span of life left anyway. Wonder if this fact has not been forgotten in some of the "direct experiments." Page 197.

BEE-KEEPING FOR INVALIDS.

Yes, from one point of view, bee-keeping is hardly the thing for invalids—calls for lively stepping around, long hours, and many other things that bee-keeping is hardly the thing for. For some one successful bee-keeping invalid, like Mrs. Astell, rather extinguishes considerable argument on the other side. And here's a good sentence from Mrs. A., worthy to be printed large on the beginner's banner: "Pay little attention to what your neighbor advises, unless you know him to be a practical apianist." The neighbor wise and gray, who has had "more or less bees around my place all my life," is especially a dangerous snare to the beginner. p. 197.

THOSE TALKS TO BEGINNERS.

Here's compliments to the talks to beginners by Mr. Gehring. They are good. But then, every new dog must expect to be snuffed at and snarled at, and I'll see if I can't find a place where I can snap my teeth together. Ah, here it is: "They give up as soon as they find themselves prisoners—always and everywhere." This is very correct as a general truth; but there are occasional exceptions, that they do sometimes ignore everything else but the consuming passion to find a vulnerable place and put in a sting. The bee under your veil almost always feels intimidated and tries to get out, even the beekeeper's ones have preceded to business. I think this takes in two ways, sometimes by being too infiltrated to notice the plainest evidence of imprisonment, and sometimes by taking a few turns around, sizing up the situation, and then, when the beekeeper has sworn to die in the attempt does best to "strike home" at once. p. 199.

NECTAR-GATHERING MICE.

Our bees, of course, have the other insects and the humming-birds as competitors; but it is news to be informed that there are nectar-gathering mice. (Apologies to the scientists who want them called Marsupials; but the picture says they're mice.) Certainly animate nature is amazingly versatile in its forms. Page 212.

The Afterthought.

The "Old Reliable" seen thru New and Unrealible Glasses.
By E. E. Hasty.

The Home Circle.

Conducted by Prof. A. J. Cook, Claremont, Calif.

ATTRACTION HOMES AND SURROUNDINGS.

The home circle like everything else about us, is wonderfully affected by the surroundings. One might say there are the influence about the kind word and the thoughtful act in the home. I spoke truly of the marvelous influence of the flowers in the home. I think it was Henry Ward Beecher who said, "Show me the books and the bees, and I will tell you who to visit." And the company frequent the same, and I will rightly describe the people of that home. The home is not simply confined to the inside of the walls that domicile us. The immediate surroundings of the house are of equal importance in their influence to refine the character and mould the tastes.

Some years since, the village of Kalamazoo, Mich.—it was larger than a great many cities—gained a wide reputation, not only for being the largest village in the United States, but for being one of the most beautiful towns in the country. It was not that the houses were palatial. Many of these were cottages, and not a few were very humble in their dimensions and architecture. But the thing that attracted everybody, and gave the village its name, was the fact that beautifully kept lawns and lovely flowers, shrubs and trees, usually arranged with the skill of an artist, which adorned nearly every home in that beautiful village. I hardly need say that the people of Kalamazoo were exceptional in refinement, intelligence and enterprize, loneliness like music charmed every one and will certainly attract the best to its near presence. Kalamazoo had its fine public library, its ladies' club which attracted large attention, and its drives and boulevards which were enchanting. People were delighted in spending their summer outings in this lovely spot.

We may not all be so fortunate as to live in Kalamazoo. We may be so unfortunate as to have neighbors who care little for neatness, order, and beauty. We can, of all, most yet our home the pride, not only of those who occupy it, but also the pride of all our neighbors. Even those who are lacking in taste or are too indolent to make the exertion which fine grounds require, often show their appreciation when company comes to visit them. As they walk or drive out, they are very sure to pass by the orderly, well-cared-for places of the town or neighborhood. How many reasons there are why each of us should do all in our power to make our grounds the most lovely and attractive in the neighborhood. Whatever gives us pleasure, we have shown already, will add to health and longevity. Thus we score again for the neat home grounds. We love to have our immediate friends refined and cultured. I wonder if children that are brought up from the earliest years, where everything tells of neatness and order, who never fail to receive something of real refinement. Surely if beauty about the home works such blessedness in its members, we may tally again for home adornment. We know what the Scripture says about the heaven, and how all the moral beauty is transformed. Can any of us have a higher ambition than a wish to plant this heaven that shall tend to make all the homes of our vicinity attractive and beautiful?

I believe I know just why Kalamazoo gained such a wide reputation for its superlative attractiveness. There is no question but that an exceptionally large number of the first settlers of that beautiful little village came from just such homes as we have been trying to describe, and were so attracted to beautiful surroundings that they gave first attention to making their own homes so neat and lovely that others who came to the town even the less enamored of such beautiful things were at once led to follow the good example already set. Soon, it would be said and receivable by any slovenly place was populated to disfigure the view. The plan was to have the village set the example, and thus the whole village became famous through the State and country.

Possibly we bee-keepers stand in special need of some exhortation in this department. In California, especially, the apiary is off in some canyon or on some secluded mesa, and is likely to be seldom visited by any but the bee-keeper and his family. Thus the stimulus which comes from rubbing against the world and from its criticism is wholly lacking, and we are likely to become largely indifferent as regards the appearance.
not only of the apiary but also of the cabin or house in ease we live near the apiary, and all the surroundings. If we do make the apiary our home, and the family shares its pleasures with us, we certainly can not afford to neglect these adornments which will go so far and do so much to make our loved ones posset of a personality which will live through the whole of our lives and delight us and bless the world. Here again we score heavily for home adornment.

There is another reason why we should all look to it that our homes are made as attractive as our means and time will permit. By giving a little more time, we can purchase our flowers, shrubs, vines, and the like, for all that is needed at a slight cost. By giving study to the grounds of others we can learn what are the most beautiful plants and shrubs. This will not only improve our observation but will be a delight in itself. Thus as we come together for ourselves we shall make few, if any, mistakes. By giving a little time each day we can do all that is required, and hardly feel it either in time or labor. We thus keep in touch with all about our home and it soon becomes so much a part of us that it develops within us a love of the place which does so much to sweeten life.

The above is not simply theory with me, for in our own home we have tried to carry out what I have suggested above. California has much to encourage one in this kind of an undertaking. The flowers and plants here are so varied and beautiful that it is a wonder that even the dormant ones will not move to bring them to their own dooryard. The soil here is also so marvelously productive that a single season will suffice to clothe a bare place in the landscape with beauty and verdure that would require years in the more tardy East. Wherever we go, whether in the country or in the city, we are all eagerly watching for vines, flowers or shrubs that are more lovely than those which we already possess. Our excursions are therefore more enjoyable, and we have been able to select the most beauti ful of these flowers and shrubs and place them anywhere. We each of us, then, planned how we would have our walks and drives, where we would put the lawn and where we would put the various plants that might show off to the best effect. We made plans and plans and selected the one which all agreed would serve best for our special place and purpose. We then set out the plants and all have had a part in cultivating the ground, adding the needed water and using the pruning shears. What a bond of interest this forms in the home! What a delightful thing, to think of how it prolongs the meal-time hour. Thus we see that the advantages in all this beautiful work of home adornment reach out in many ways, and pay a tremendous interest on the capital invested.

We are all very fond of grapes and have sought out what we believe are the best, selecting from both foreign and American varieties, and have planted them in two rows about eight feet apart. We have used both gas-pipe and have made arches spanning the drive toward the house. The vines run over this and form a beautiful arbor. This not only affords a shady place to sit and read, and, in the autumn, to eat, but also hides the clothes-line which in the dry climate of California has little need of the sunshine to make its position suitable.

On the north side of our house, similar arbors of English ivy and other beautiful vines form another cozy nook. We have not only thought of shade but of other beautifying shade we plant the exquisite ferns, the charming begonias and the graceful climbing azaleas. These anchor the climbing rose-bushes—wisteria, solanum, tanecus, etc.—away from the house, and give a great deal of color and beauty to our gardens, which are admired by all. Surely, the home circle does not know what it misses if it does not do all it can in this matter of adornment of home grounds.

We have also studied up the matter of fruits, and have added such fruit-trees as we think will contribute most to the comfort and satisfaction of the family. In California, this is a matter of exceeding interest as almost all the fruits known to our country do well here. I remember visiting many apiarists in Michigan who had not lost sight of these matters which engage our attention to-day. I remember very well the home of Dr. Whiting, of East Saginaw, who will be remembered as such an enthusiast in all matters pertaining to the apiary. We remember with what pleasure Dr. Whiting showed us his grapes and his trees, and how proud he seemed to be, as he gave us the beautiful grapes and fruit.

Dr. Whiting enjoyed his bees, I can but believe that he received greater enjoyment from the fruit which graced his own table, and resealed the appetite of his fortunate guests. I have visited many other bee-keepers in many States of the country, and not a few of them had homes that might be the envy of any one. Many, like Dr. Miller, loved the roses and other flowers, and many of them have adorned their homes in a way to offer an object lesson of real value to all passers-by.

I do not believe it is necessary to secure the services of a landscape gardener in carrying out these suggestions. There are very few of us who, if we carefully observe the places of others, especially those that please us and think of the same expense that we are able to make, can not fashion our own grounds in a way to please us and receive the approval of the public. The very study that we shall give to the grounds of our home will be a wholesome pleasure and valuable in the added knowledge which we shall receive. It is also valuable and even more delightful to talk these matters over with those whose beautiful places show that they have taste and appreciation. I have visited almost every place in Southern California. Some of these places, like Montecito and Palos Verdes, are to California what Kalamazoo is to Michigan. With what exquisite delight I look upon and studied the many beautiful places of these cities. How I have enjoyed talking with the owners and finding out the principles which they had used so successfully in adorning their own beautiful grounds. With what especial delight did I take Mrs. Cook to enjoy with me the environs of the second city, and with what eagerness I have wished we could all visit with Mrs. Cook to enjoy together the incomparable beauty of the little suburb of Santa Barbara, known as Montecito.

General Items

FARM WAGON ECONOMY.

The economy of this proposition is not all that is found in the very reasonable price of the wagon itself, but in the fact that the wagon will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon, and the new famous Electric Wheels, have solved the problem of a successful and durable low-wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material that can be obtained—wheels, axles, wheels, etc. Guaranteed to carry 400 lbs. These Electric wheels when made in any wagon, and make practically the same effect as one. They can be had in any height desired and any weight required. With an extra set of these wheels, the farmer can interchange them with his regular wheels and have a high or low-wagon at will.

Write for catalog of the full Electric Line to Electric Wheel Co., Farmington, Conn., Ill. Please mention Bee Journal when writing.

Bees in Fair Condition.

I put all my bees out April 29th, and they are only in fair condition, being light in weight and also in bees. I lost 6 thru starvation and others that were brought in were due to not being able to put them into the cellar myself. I had 220 colonies.

EGYPTIAN AND HUNGARIAN BEES.

I have yet to see the first Egyptian bees. Many years ago Mr. J. W. Winder, of Cincinnati, and not very sorry to see in last year's Bee Journal, offered to send me an Egyptian queen the succeeding spring with the pollen of them during the winter which followed. I have had more experience with the Hungarian bees, as I once took care of a colony for an old friend, who has since passed away. I

ITALIAN QUEENS.

Having been 25 years rearing Queens for this Apiary, I have the best known plans, will continue to recommend them.

PRICES.

One Unrestilled Queen $10.00
One Tested Queen 1.25
One Select Tested Queen 1.50
One Breeder 3.00
One Comb Nucelles 1.50

BELGIAN HARES

Choice, pedigreed and common stock; youngers, $3.00 per pair. Write for description and prices.

J. STRONG

Clarefield, Page Co., Iowa.
Red Clover Queens

LONG-TONGUED BEES ARE DEMANDED NOW.

One Untested Italian Queen FREE as a Premium for sending us two new subscribers to the American Bee Journal for one year (with $2; or, one Tested Queen free as a premium for sending us four new subscribers with $4.00.)

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported him himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veils or smoke. They store red clover honey last season.

Orders for these fine, "long-reach" queens will be filled in rotation—first come, first served;—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipping, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to GEORGE W. YORK & CO., 144 & 146 Erle St., CHICAGO, ILL.

Buggy Announcement Extraordinary.

The Kalamazoo Carriage and Harness Co. of Kalamazoo, Michigan, have adopted the plan of sending their vehicles anywhere, on 10 days' free trial. They sell direct to consumers at wholesale prices and allow you to take the vehicle from the depot, hitch up to it, try the springs, running qualities, see the trimmings, finish and style before you decide to keep it. No man should "cut the bag, sized unison," They know the quality of their goods and are willing to let them sell themselves. Write for free catalogue on these merits.

KALAMAZOO CARRAGE AND HARNESS Co.,
Box 53 Kalamazoo, Michigan.

Weather Unfavorable for Bees.

This is cold weather for bees. Mine came out for a flight April 3d, and those that were alive had a good one. The loss was 12 percent, and if the weather does not change soon I am afraid we shall lose more. There is such a cold wind blowing from the northeast that I am unable to open my hives, but I hope a day will soon come when I can look them over. I know that some of mines are very light, but I am hoping for the best, and I am very much interested in bees. I would like to know what a bee-house is; where it keeps itself; and what the work is that it does in a bee-hive. C. H. Vogt.

Manitou Co., Wis., April 24.

Bees Bringing in Pollen.

Bees came thru the winter nicely, I put them out April 10th, and they brought in pollen an hour after being put on the summer stands. We had heavy frosts April 19th and 29th, the temperature being 21 degrees above zero, but since then the bees have been working lively. They are stronger than usual. I am getting better slowly, but can not do much as yet. I. Threlkell.

Blacks vs. Italians in Brood-Rearing.

I wintered 42 colonies of bees on the summer stands with no protection, and did not lose a colony. I think black bees far ahead of Italians in regard to brood-rearing. C. C. Ream.

Severe Winter Causes Heavy Losses.

My loss so far is 10 out of 25, and I hope the limit has been reached. The weather was so severe all winter that the bees could not reach their stores, so I have been feeding the honey to the survivors. Mrs. C. A. Ball.

Oneida Co., N.Y., April 22.

Bee-Keeping and Bears in Florida.

The secretion of nectar from flowers in this locality has been rather poor so far this season. There have been cool winds and heavy falls of rain. Fruit trees have bloomed profusely, and are now thru with the exception of Burbank plums, which are now opening. The plum season is very early this year, and has been for several weeks, and is a great favorite with bees.

There is an apiary located at the mouth of
the Cheetahtchawke River, near a swamp 15 miles across. The damp, rich soil produces many honey-yielding plants, and it furnish enough secure retreat for bees: one visited the apiary, and ate and destroyed 15 colonies. On an arm of St. Andrews Bay, where an apiary is located, bear destroyed several stanchies, but was shot, and much meed secured and a fine pet.

R. A. HEXT.

Fillmore Co., Minn., April 16.

Last Year an Average One.

My bees wintered well. Last fall I put 54 colonies into the cellar, and last week took out that number in fine shape. Last year the bees have wintered out, as I got about 1,800 pounds of honey.

J. F. ROWLEE.

Osweego Co., N. Y., April 23.

Bees Building Up Nicely.

Bees are building up nicely, and are swarming, but not storing very much honey than they consume. I expect the honey will be from the second cutting of alfalfa, which will be in May.

I appreciate the American Bee Journal very much.

Mrs. A. BOWEN.

Meredic Co., Calif. April 16.

Gathering Pollen and Honey.

We have had a very backward, cold spring, but the bees have wintered well, and it is nice weather now. They are bringing in pollen and some honey from the woods. I have lost colonies. They are very irregular. Some hives, sparsely placed, are good. Clover wintered splendidly, both white and aliskc. DANIEL STUART.

Ontario, Canada. April 27.

Bees Gathering Honey.

My bees wintered tthrop, and are bringing in lots of honey to-day. The American Bee Journal is all right.

GILBERT BROWN.

Fulton Co., N. Y., April 27.

Wintered With Small Loss.

The bees have come thru the winter in good shape, mainly due to the cool weather of 60. It is snowing here to-day, and the temperature is 36 degrees above zero.

FRED HUTCHINSON.

Livingston Co., N. Y., April 19.

Bees in Eastern Pennsylvania.

I am starting in the bee-business in a locality which I suppose is about the poorest in the state. My bees are kept in large quantities by almost every farmer in the neighborhood—from one to five colonies—in the old-fashioned box. All of them are kept for the little surplus honey, only from 5 to 15 pounds from their best colonies. I know of some that the hives have not gotten up until the third year in succession. Bee-plants are very scarce around here, except that of fruit-bloom and white clover, which, however, are quite plentiful. Almost every foot of soil is cultivated, and all weeds and wild flowers along the fencelines and road sides are cut down. There is no buckwheat raised here any more, which used to produce large quantities of honey. We need the bees longingly, as the crops are very badly in this part of the country, as there are hundreds of acres of red clover around here, where barley or hay would do to good advantage.

I bought several colonies of black bees last spring at $1.00 per colony, and expect to transfer some of them into developed hives, and later on supply them with Italian queens.

F. M. MAYBERRY.

Montgomery Co., Pa., April 18.

Tennessee Queens!

Fine lot of Choice Tested Queens ready for sale, daughters of select imported and select golden queens, reared 100% from pure bees, and mated to selected drones, $1.50 each. Aided warranty. Queens, from same breeders, either strain, 75 cts. each. No bees owned more than 25 miles. None impairs within 3, and but few of these 5 miles. 25 years' experience. Discount on large orders. Contracts with dealers a specialty.

Quilts or No Quilts.

At the Ontario convention, reported in the Canadian Bee Journal, 18 were in favor of quilts and 12 opposed.

Sugar for Feeding

It is good in the fall, perhaps better than honey; but for spring, honey is away ahead, says A. Alberti in Deutsche H. B. Ttag. The sugar needs a digestion that the honey does not, and in the fall and early winter this little matter because the food is taken in such small portions that when breaking down in late spring or winter, then it is consumed in larger quantities, and so many more sugar overburdens.

Hoffman Frames.

These have been strongly championed by Editor Root, but he now admits that there are localities in which propolis is so bad that Hoffman Frames are impracticable.

A Plan of Producing Comb Honey.

Here is a matter for you to try in your apiaries. It is the system to be used with shallows, discharging brood-chamber thru the spring. Manage so as to have the brood as much as possible in one cell. The chambers for feeding the brood nest in the upper one, and spread it and manipulate as much of the full of brood. The success does not depend on this getting the one set of combs solid full of brood, tho to obtain best results it will pay to do so. With this system there is so much room you keep down the swarming fever, and I think the room to spread, especially downward, gives a greater vigor of work than a crowded hive.

Ten days before the flow begins, put the queen in the lower chamber with a little brood—one comb with any amount of brood will be plenty; an excluder on this, and the rest of the brood on top. At the beginning of the flow when the flow is just starting, take to a new stand the lower hive with the queen, and put the brood chamber on the new stand with nothing but its sealed brood and no queen, but give a virgin queen or ripe protected cell, or wait two or three days and give a queen for cell. Give only a cell or a virgin queen, because the brood is all sealed that is left on the old small; and while the virgin is mating and getting ready to lay, the brood is hatch- ing; so when she does begin laying, the last of the brood is about ready to emerge, and your colony is just in the condition of a colony that has swarmed naturally, and their young queen just ready to lay, except that you have kept the strength of the colony on the old stand, and have been getting section work. As the brood hatch, the brood-cells are filled with honey; but as that young queen begins to lay, that honey goes up to the sections out of her way, and you have no swarming, either.

This system anticipates quite a contracted brood-chamber left on the old stand, which would be the result with one section of a discharging brood-chamber, hence there would not be an great amount of honey. You can do it during the time the queen was not laying. To make the best test with the eight-frame hives, I suggest that you use six to the box, using a dummy at each side; thus you have a twelve-frame hive before the separation at the start of the flow, and way up the strength. The whole plan contemplates a big hive up till the flow, then a very small one on the old stand, and yet all swarming effectually control, with the force of feeders right where they

A HANDY TOOL-HOLDER!

Sent by Express, for $1.50; or with the Bee Journal one year—both for $2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Superintendents, Railway Officials, Quarryman, Farmer, or anyone using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes. See the work done from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to very desired size by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an LEADLE the Tool is moved to the right. It is free along the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

Spraying Trees in Bloom.

I have already reported that the Experiment Station at Geneva, N. Y., counseled against spraying trees while in bloom; that it may kill the blossoms. But I have also been counseled that the delicate organs of the flowers; that in some cases those who had been most active in urging spraying during blossoming-time had to suffer the sorrow that such spraying had seriously cut down their fruit crops. While these experiments were being conducted and in that vicinity, the same kind of experiments were being carried on at Cornell Uni-
versity, N.Y.; and now we have a report from John Craig, of Cornell station, concerning the findings of the General station. This report is published in the American Gardening for April 9th.

It has been urged by the advocates of spraying in bloom, that during seasons like that of 1890, when the trees are heavily loaded with blossoms, the spraying has a much smaller chance of the reaching away the superabundance of fruit. Regarding this, Mr. Craig very peremptorily says:

"It seems that, when this admission is made, the strength of the argument is very much weakened, for if the spraying process, when carried on correctly, can be practiced with safety and advantage only in seasons of heavy bloom," Elsewhere he states that spraying was injurious to tender tissues; and that, the more delicate the structure the more likely is injury to ensue. The spraying process follows spraying trees in bloom is probably due to the injury to the pistils or stigmatic surface by the spraying insect.

Mr. Craig then mentioned another objection to spraying in bloom viz., the destruction of the bees; and then, in giving a reason why such destruction should not take place, he says:

"When cross-pollination is carried on by the bees, the fruit will be more secure; self-pollination occurs. Now, if we cover our apple-blossoms with mixtures which are likely to prevent the bees in the blossoms, then, I think that we shall be using against ourselves a double-edged weapon."

When it is remembered that these experimental stations are at the Geneva and Cornell stations at the instruction of the fruit-men, who are anxious to prove that spraying during blooming-time was an advantage, the results, being just the reverse of what was expected, are all the more valuable. —Editorial in Gleanings in Bee Culture.

$15.00 and $25.00 Queens

Having a Measured Tongue Reach.

The call for queens of our celebrated $200 imported mother has been so great that we have decided, in addition to the $2.00, $4.00, and $6.00 grades of this stock, to offer some $10.00, $15.00, and even $25.00 of this same blood. But these prices are for tested queens, the tongues of whose bees have been measured.

The $10.00 queen is guaranteed to produce bees with a tongue-measurement of 19–100.

The $15.00 queen, 20–100.

The $25.00 queen, 21–100.

These last are very rare and with one exception this (21–100) is the longest tongue reach yet secured. We reserve the right, when we do not have the stock with the tongue reach called for, to either return the money or to send the next lower, remitting the balance. It would be well for our friends to put in their orders at once, and as soon as we get the grades we will send notice. When the money is sent, the queens will be forwarded. These will be put up in the very best manner possible; and while we guarantee safe arrival in good order to any point in the United States, on any railway line, we will not guarantee safe introduction. Such valuable queens should be reared on hatching brood.

N. B.—It seems as if it ought not to be necessary to say that no one but a queen-breeder or a large honey-producer should order these high-priced queens; but it is a fact according to our experience that beginners with only a few colonies will order our highest priced imported queens. Such beekeepers have no more use for such queens than a pig has for a wheel-barrow.

MR. JESSE M. DONALDSON AND HIS APIARY.
(See page 312.)
Weekly Budget.

REV. E. T. ABBOTT will soon lecture at the high school in St. Joseph, Mo., on bees and bee-keeping. He knows how to do it in an interesting and profitable manner.

MR. O. O. POPPLETON, of Dade City, Fla., writing us May 1st, said:

"This season in this locality the honey-flow will be an almost absolute failure, because of lack of saw pines to pollinate, but there is plenty of bloom farther up the coast."

Mr. Daniel Danielson, one of the prominent bee-keepers of Turner Co., South Dakota, gave us a call recently. He had been in a Chicago hospital for awhile, and was about to return to his home and farm, where he looks after the bees, not being able to do heavy farm work any more.

Mr. M. L. Treaster, of Nebraska, called on us May 3d. He is not now engaged in bee-keeping, and has not been for years. At one time he was secretary of the Nebraska State Bee-Keepers’ Association. Nearly 30 years ago he had a super-abundance of foul brood. It is an interesting story, as he tells it, though one that he would not like to experience again.

Messrs. Bartlett Bros. & Merrick, last year, in one apiary in Utah, from 100 colonies and their respective Trombley colonies of 25,000, got:

No. 1, white extracted honey 27½ tons, or a shade more than 343 pounds per colony, spring count—cleanings in Bee-Culture. It is no great thing to get 343 pounds of extracted honey from one colony—that has often been beaten. To get that amount from each of 25 Trombley colonies would be remarkable; from 199, spring count, in one apiary—it is stupendous!

Mr. Wm. M. Whitney, of Kankakee Co., Ill., wrote us April 24th as follows:

FRIEND YORK,—I am trying to get caught up on my reading matter, which accumulated during my long absence, and I spend much of my leisure time with the "Old Reliable." While I expected to attend all the sessions of the National Association in Chicago, on account of ill health I was there at the opening session only. I have been very much interested in the report of the proceedings.

On many questions discussed, it is plain, I think, that difference in locality, with different climatic conditions, differences in trading conditions, etc., make all the difference in the world in conclusions—change places and circumstances, and opinions reverse as quickly.

I think you are entirely right in the matter of labeling your honey. If any producer desires to do retail business, why, it would be all right to label his packages; but it would be presumptuous in me, to wholesale to you, and expect you to label to the retail trade or consumer.

I am with the majority respecting the second-hand tin cans. Of the few I purchased two years ago, three were used—two spoiled my honey, and the other was used for refusal dignities. The third has never been taken from the cases. They were so rusty, and smelt so badly, I dared not use them for anything. But I paid 3½ cents per pound, and took out the price paid, and sold for waste honey.

I had heard nothing of your removal till the day I concluded on you at your present location; nor did I realize the extent of your misfortune till I read the account in the Bee Journal. You certainly have the sympathy of all your patrons, and it is hoped that what seems a misfortune may prove a blessing in disguise. Your present location is certainly much more convenient than the other. I am just lucky enough at my age (73) to prefer riding four or five blocks on street-cars, to climbing two or three flights of stairs, when I wish to find you.

I hope you have not sustained a serious loss. Truly yours,

WM. M. WHITNEY.

The loss on the stock of bee-keepers’ supplies was much larger than we anticipated at the time we settled with the insurance company. We should have paid at least twice the amount received.

As you say, we believe our patrons will help us out by giving us all the trade they can, and especially try to help us extend the circulation of the old American Bee Journal. For all of which we will be truly grateful, and do our best to give them good value in return.

"BEE-KEEPING BY AN AMATEUR" is the heading of an article in the Bee-Keepers’ Review, accompanied by a fine picture of the apiary of the "amateur," Peter N. Duff, of Cook Co., Ill. Beginning less than two years ago, he now has 52 colonies—a pretty good outfit for one who calls himself an amateur. He wintered his bees in a repository above ground at a place generally considered bad, but as he succeeded in keeping the temperature between 40 and 48 degrees, he must be excused for successfully wintering. A small oil-heater, with chimney to carry off gases, raised the temperature when too low. Success to the genial Mr. Duff.

Mr. GEO. THOMPSON, of Geneva, Ill., we regret very much to learn, died April 14th. He was one of the oldest bee-keepers in northern Illinois, and a very staunch friend of the American Bee Journal and its editor. We feel that his departure is indeed a personal loss, and our sympathy is extended to Mrs. Thompson and the bereft family. We understand she has a number of complete volumes of the American Bee Journal, which she, of course, has no use for, and would like to sell. Any of our readers desiring such volumes would do well to write Mrs. Thompson.

That story about Bee-Trackers in Texas who make a living by marking a single bee as it leaves its hive, then following it mounted on a bronco without ever losing sight of it till it alights on a particular flower, and thus the kind of honey is tracked for exact place—the bee-trackers generally each have a hand Queen with the remark that in that part of Texas it isn’t the men that track the bees, but the bees that track the men! No doubt the men often “make tracks,” and that in rapid succession, too.

Mr. CHAS. KOEPFEN reports in the Bee-Keepers’ Review for this month. Without any help, he took 14,000 pounds of comb honey from six apiaries. Unfortunately the size of the apiaries is not given, nor the yield per colony. If he had 120 colonies averaging 117 pounds each, he must have had little time to waste. If he had 280 colonies averaging 50 pounds each, he must have done some remarkably lively stepping around.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes:

"I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation will start which will end in the sale of more or less honey: at any rate it would give one a chance to give theospel publicity to enlighten many a person in regard to honey and bees."

The picture shown here-with is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside for holding in place.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

May 16, 1900.
Heavy Rains in California—the last week in April gave almost positive assurance of large crops. It seems that the rains were quite general over the State, and particularly in the central and southern parts. Mr. W. A. Pryal, of Alhambra Co., has kindly sent us clippings from local daily newspapers which speak almost gleefully over the hopeful prospects for farmers of the State. This, of course, means much for the bee-keepers as well.

But what if old California should come up to her old-time record as a honey-producing State this year? And if all the rest of the country should also have a large honey crop, this whole nation ought to be well sweetened.

And yet, unless there is a proper distribution of the crop of honey, there will be glutted markets and losing prices. There ought to be something done to handle the crop in a manner that will realize to the producers fair and just prices for their honey product. And now is the time to think about this subject—before the crop is ready to market, and not afterward, when it is too late.

Buckwheat Comb Honey, according to Henry Segelken, of Hildreth & Segelken, in Gleanings in Bee-Culture, is in so much greater demand than extracted buckwheat that it would be well for producers to change from extracted to comb.

Queen Rearing is discussed by L. Stachniel in a very able article in Die Deutsche Bienenzucht. His manner of securing the work of queenless bees seems especially commendable. On one of his strongest colonies (several such colonies may be used) he places an excluder, and over this a hive-body in which he puts four or five frames of brood from other colonies, filling up with empty combs. In eight or nine days nearly all the brood in this upper story will be sealed, and a large number of young bees will have emerged. At this time, in the afternoon, he takes out one of the broodless combs, and moves the frames in this upper story so that a vacant space shall be left in the center, in which a frame afterward be hung. This upper story is then moved bodily to a new stand. So large a proportion of the bees being young, few will return to the old stand, and in the evening they will show full signs of queenlessness, when the frame with prepared cells is carefully pushed down into the vacant space with full expectation that prompt work will be started to rear queens, and that they will soon be under way the next morning. This hive, with its contents, can now be returned and placed over the excluder from which it was taken, when the cells will continue to completion.

Editor Pender, of the Australian Bee-Keeper, makes a practical point by saying that when he takes the frame of prepared cells from the queenless bees (which he says need only two hours to give the cells a good start) he makes sure to take with the frame all the adhering bees, and puts this frame in an upper story over an excluder, between two frames of young brood placed there at least a day before. He says:

I do not disturb the bees on the cappings any more than I can help when carrying them to the upper story. I want the work to go on without any check. If I had removed those bees hanging on the frame and put the frame into the super without any bees, it would be some time before the hive in hive 2 would find the started cells, because the hive is not over-crowded, but by taking the clinging bees, too, the building of the cells goes on as if the chance had not been made, and the bees in the super soon assist in making the cells perfect.

Time for Development of a Queen.—In the Australian Bee-Bulletin Mr. Doolittle is credited with saying that from the laying of the egg to emerging from the cell the queen requires 15 days. It is doubtful that Mr. Doolittle would be willing to father that statement, altho there is some good authority for it. In the past 40 years there has been a material shortening of the time taught. In the first volume of this journal, in the year 1861, between 17 and 18 days was given as the right time. At the present day, some say 15, some 16. The 17 to 18 days formerly taught was probably true for a weak nucleus, and 15 may be the normal time for a strong colony.

Shipping Drone-Eggs by Mail.—One difficulty in the way of rearing queens early at the North is that early drones can not be secured. “Swarthmore,” in the Rocky Mountain Bee Journal, tells how he has overcome this difficulty. By way of caution it may be said that even if drones were plenty it remains to be proven that good queens can be reared ahead of their usual time. “Swarthmore” says in part:

Last season I was prompted to do some experimenting with drone-eggs, sent to me from many distant points by post, and the result was so highly satisfactory that I cannot but give the long-suffering Northerner the benefit of these experiments.

A number of tubes of fresh-laid drone-eggs, in dry comb, were forwarded to me by mail nicely packed in tissue paper and enclosed in 4½ x 4½ section-boxes. Immediately on receipt of these bits of drone-comb they were fitted into frames and placed in the center of the brood-nest of a strong colony previously made queenless for the occasion.

Very few of these eggs were removed by the bees, and the number of dissolvements in transit was hardly worth mentioning.

The queenless bees readily accepted these drone-eggs, and each and every one will be properly cared for, reared and sent forth in handsome, healthy, flying drones long before any other colony in the yard has given a thought to drones or the need of them.

Thus the Northern breeder may gain from six to eight weeks' time in getting under way with his breeding operations for the season, and as soon as the traffic is well understood by oildraper and receiver. I warrant bees will wonder why they did not do the simple thing many years ago.

Must Bait Sections be Cleaned in the fall by the bee ? A discussion in one of the foreign bee journals as to whether it was best to put away extracting-combs in the fall without first having them licked out by the bees showed a division of opinion and practice. The claim was made that if the combs were left wet there was danger that the small quantity of comb left would sour. On the other hand, it was urged that giving back the combs in the fall was likely to induce robbing, and that worms were not likely to trouble the wet combs so much as the dry ones. Strangely enough, little or nothing was said about the chief objection urged in this country—the effect of the granules of honey inducing granulation in the fresh honey stored in the cells.

It has been held that the need for fall cleaning by the bees was more urgent in the case of sections than extracting-combs. But G. M. Doolittle comes forward in Gleanings in Bee-Culture and stoutly asserts that it is all a mistake to suppose that honey left in bait-combs will granulate any quicker than it would have done if the sections had been full. He claims as good results by using baits that have not been cleaned out by the bees in the fall. Several others have reported, some on one side and some on the other. So far from agreeing with Mr. Doolittle, Mrs. A. J. Barber reports that even when cleaned out by the bees, bait-sections are very slow in being sealed. Others say that bait-sections when properly cleaned out in the fall by the bees and used the following summer are the first to be sealed. A call for more reports is made, and the end is not yet.

“The Way from the Cappings of a ton of honey I find to be about 35 pounds when all completely capped, about 30 pounds.” So says R. Beume, in the Australian Bee-Bulletin.
CONVENTION PROCEEDINGS.

Report of the Utah Bee-Keeper's Convention.

The Utah Bee-Keeper's Association held a convention April 5, 1901. The meeting was called to order by Tres. Lovesy promptly at 10 o'clock, a.m. Secretary J. B. Fagg called the roll and read the minutes of the previous meeting.

A letter was read by County Vice-president C. C. Hartlett, of Uintah County, regrettting his inability to attend. He reported the bee-industry in Uintah County in a satisfactory condition; also that there were 50 or more bee-keepers in the county, and about 20,000 hives. Similar reports were made from County Vice-presidents A. N. Winson, of Washington County, W. J. F. McAllister, of Kanab County, and P. M. Grigg, of Wayne County.

Mr. Roberts, one of our old-time bee-keepers, and who was one of the first to introduce bees into Utah, gave some of his early experiences in hauling bees many hundred miles on wagons from California. He also spoke on the introduction of the movable frame, on organization among bee-keepers, and on the medicinal qualities of honey.

THE PRESIDENT'S ADDRESS.

I have received fair to flattering reports from nearly all parts of the State during the past 10 to 15 days. The reports from some of the central and southern parts, especially, have been universally encouraging in the prospects for the coming season. I find, as a rule, that the snowfall has been abundant, and it has been more evenly distributed over the State than in other years. Thus insuring a fair amount of irrigation water, and so the chances for success are fairly good where the bees are in good condition. But while the many hopeful letters I have received give an encouraging outlook, still the bright picture may have a dark side to it. While the winter has been very much above the average in some localities, still a more serious condition exists in at least one or more counties. I find that there is a great deal of disease among the bees in some places. I have tried to urge a more persistent effort on the part of our bee-keepers to eradicate this disease, resting that a few minutes spent in prevention are worth a month trying to cure. And one of the many reasons for publishing our expected treatise is that it will benefit our bee-keepers and bee-inspectors by putting into the hands of every bee-keeper simple and effective remedies for the benefit of himself and the industry. Our bee-keepers can and should take a new pace in the new century by helping themselves and aiding the Association in its laudable efforts.

There are other things which we as bee-keepers could improve on to our own benefit and advantage, and one of these is organization. We need no prophet to tell us that our only salvation depends upon a strong union of interest by proper organization. We find that the trades, laborers, farmers, etc., are organizing for mutual benefit, and why should not the bee-keepers? They should organize for the purchase of supplies and also for the disposal of their products.

Some many obstacles can be overcome by timely and proper management, still our brightest prospects do not always turn out a shining success, and if we attempt to count our profits by the prospects, we sometimes reap disappointments. I find the greatest interest in this State still an unsolved problem; while with proper care the bees can be wintered successfully in most parts, in some places success seems to be almost impossible.

Would it not be well to consider the question of our Association making an exhibit at our State fair, or the one at Buffalo, and also the World's Fair to be held in St. Louis two years hence? We certainly should be represented there. I would be pleased to have our bee-keepers throw additional light and information on these matters, or any other one in the interest of the industry, not forgetting the treatise which I wish to publish as soon as possible.

E. S. LOVEY.

Vice-President J. Hansen, of Boxelder County, reported the industry in his local and southern parts, of the same county, reported quite a loss of bees in wintering in his portion of the county, and J. L. P. Johnson, also of Boxelder County, wrote that as a rule conditions were favorable, but that there was some foul brood.

County Vice-Presidents Geo. Hone, of Utah County, A. F. Stevenson, of Davis County, C. O. Falkman, of Weber County, Thos. Belliston, of Juab County, and Ulrich Braymer of Carbon County, reported their respective counties in fairly good condition. A number of letters were read from the secretary from county vice-presidents, inspectors, and others, and while most of the reports were encouraging, some spoke of loss by disease.

Inspector Anderson, of Cache County, said they had some disease, and that the county commissioners desired him to do all in his power to eradicate it. Mr. Scott reported much disease in some localities, and Mr. Dart exhibited samples of diseased food, and other interesting articles from Fort Worth, Tex., after which a long discussion ensued as to the cause and effect of disease, the best treatment to prevent, cure, etc. The McEvoy treatment, with some modifications, was recommended. Our bee-keepers are waking up, and with the aid of our treatise, our county inspectors, we hope soon to banish it from the State.

A resolution was offered favoring the publication of a treatise or pamphlet by the Association, the object of which is to give the best and quickest method of fighting and preventing disease among the bees; and also how best to protect them against their enemies. Also, that the State law, the relation of bees to fruit, seed, plants, etc., be published in connection with it. After a long discussion which was participated in by many, the resolution was unanimously passed, and Pres. Lovesy, Secretary Fagg, and Messrs. Thos. Belliston, L. J. Whitney, and F. S. Dart, were appointed a committee to compile and publish the treatise.

Stronger organization among bee-keepers was discussed at length, with no definite results. A resolution was presented and passed, urging the bee-keepers to aid the Association in making an exhibit at the State Fair in October, and also in Utah and St. Louis. Many reports were given, coming from honey-consumers in the East, praising the superiority of Utah honey.

The election of officers resulted as follows: President, E. S. Lovesy; 1st Vice-President, R. T. Rhino; 2d Vice-President, Wm. Warham; and Secretary and Treasurer, J. B. Fagg; Assistant Secretary, C. R. Matson. County vice-presidents, Salt Lake, Wm. A. Bills; Utah, George Hone; Washington, A. G. Stevenson; Juab, J. Hansen; Weber, C. O. Falkman; Juab, Thos. Belliston; Utah, A. N. Winson; Tooele, Ben Barrows; Cache, Henry Bullock; Morgan, T. R. G. Welch; Uintah, C. C. Bartlett; Emery, Chris Wilcox; Wayne, P. M. Grigg; Carbon, Ulrich Braymer; Sevier, R. A. Lowe; Kane, W. J. F. McAlister.

AFTERTWO SESSION, 2 P.M.

The next question considered was the purchase of supplies and the disposal of bee-products. It was stated that nearly all supplies except sections can be purchased in the home market; the only supply that has to be sent out for is material for the hives. Howard, it was decided to try to keep all bee-keepers informed as to prices, from time to time. The question of grading was discussed at length, and it was shown that a few dealers prefer the raw honey to the cut, and that it is cheaper. Still there is a good demand for the best, regardless of the difference in the price.

Mr. Scott urged bee-keepers to be careful in grading their comb honey, because a few partially filled or un capped comb would not only materially reduce the price of the honey, but it would injure the reputation of the bee-keepers. Mr. Hone stated that, as a rule, the greater portion of the bee-keepers of Utah had a good reputation for fair dealing, but in order to protect their products in many cases they ought to stamp their names on each case.

QUESTION BOX.

Ques.—Is dividing preferable to swarming?

Mr. Hone preferred dividing because he had better success than with swarming. Mr. Whitney obtained very good results by forced swarming. Mr. Lovesy preferred dividing, as the bees are more gentle, the colonies more easily regulated, and better results can be obtained.

Ques.—What style of hive is preferred?

Mr. Fagg.—The 10-frame Langstroth for all practical purposes, both for our own and contracted hives.

Ques.—Does spraying during fruit-bloom kill the bees?

It was proven that it did, and also that it was an injury and no benefit to the fruit-grower.

Ques.—Is queen-stamping necessary?

It was decided that it is.

Mr. Dart.—I put new burraps between the hive and super, with some chaff in it; this keeps the bees dry, and I have no trouble.

Bees Dying in the Hives—One of the Causes.

BY C. P. DADANT.

I SEE an inquiry on page 201, concerning the cause of the great and almost total loss of bees and the recorded hives in one apiary, the bee-keepers being at a loss to decide to the bee-losses in this vicinity during the winter of 1879-80, and I will ask leave to describe it.

The season of 1879 was very dry. During the summer and fall the bees harvested nothing. But fruits were plentiful and so were brier and raspberries. This season on all sorts of damaged fruit. They began on damaged peaches, in August, then to grapes, and later to apples. The number of bees found in small vineyards was so great that the win ters held meetings in which they discussed the advisibility of petitioning the Legislature to obtain a law forbidding the keeping of more than 20 colonies of bees in one apiary. Wherever a damaged berry was found it was full of bees and most of the grape-growers were of the opinion that it was the bees that punctured the fruit. Arguments were out of question until the heads became cooler, and it was at that time that we decided to plant grapes on a large scale in order to show our neighbors that grapes and bees long kept profitably on the same farm, in large numbers and without mutual injury. The damage in this case was really greater on the bees than on the fruit, which had of itself no value for any one, and that with such water, unhealthy food, they became unable to do anything. This unwholesome sweet (?) fermented in the hive and became inferior wine, cider, vinegar—yes, mainly vinegar. But there was nothing else for them except an occasional sorgl to pass through this disastrous winter, prospered and thrived when warm days came, on the plunder that they obtained from deserted hives, for the stuff seemed to be scattered in small patches in many of the combs, of the most of it being unsealed, as might be expected.

The most damaging result of this reduced food is certainly brought about by the confinement of the bees during cold weather. In an open winter, when the bees can have a flight once a week, I believe much less trouble would ensue, but when the bees are long confined on the comb, with such water, unhealthy food, they become unable to retain their excreta and the healthy bees catch the infection from the diseased ones. The after result of this trouble in spring is, sometimes, constipation or an indication of undernourishment. This is caused by the failure in the spring to carry on their food in a more warm. But in most instances the disease slowly disappears or wears out. I have, however, seen it persist through the summer in a few hives and the diseased bees kept themselves alive by varying the amount of food that they were carried out by their merciless sisters, for the bee is pitiless to the useless member of the family, and sickness finds no sympathy with her.

I cannot help thinking that the case mentioned on page 201 is identical with what I have described. The fruit-juce stores, the sickly bees dying in small clusters, the stench in the hives, and the protracted cold weather, all lead to the conclusion of the cause. This has become a more and more common winter cause. By the time this article appears in print, there may be left of that apiary which will probably be in much better condition, as the spring blossoms are a sovereign remedy for Winter's ill-doings.

Hancock Co., Ill.

Numbering Hives and Keeping a Record.

BY C. DAVENPORT.

There are some who do not consider it necessary to have hives numbered, but to me it would seem almost impossible to handle a large number of colonies unless the hives were all numbered or distinguished by a letter or number. This is true of all kinds of operations. Hives are also numbered, and to have both hives and rows numbered saves a large amount of work, for, as will be explained, it enables me easily to keep track of each colony and the entire assemblage of colonies. It is of nearly as much importance, I can find or tell where any colony is without searching over the entire yard.

Instead of using a record-book I use smooth pieces of thin blotting paper, which I cross with boards 16 inches long. I much prefer these boards to a book or paper of any kind for all transient records, as they are a great deal harder. For permanent records a book is, of course, preferable. With my system it requires about three of the record-boards for a 100 colonies. In the case of 100 colonies, but each board can be used for a number of seasons, for at the end of the season, if there is anything on them which is to be preserved, it can be transferred to a book, and the writing on the boards planned off, when they are ready for use again the next season.

After the bees are put out in the spring, the condition of each colony is set down on one of these boards. A board is marked off into as many rows as there are rows of hives in the yard, and if, for instance, the colony in hive No. 8 in row 5 is weak in bees and short of stores, it is marked off on the board under row five thus: 8—M—W—B.

The letter M after the number of the hive shows that this hive is the middle colony, the B, that it has but one colony. If I have the rows run east and west, and if I have been nearer the east end of the row than the middle, the first letter would have been E instead of M; or W if nearer the west end.

The first letter after the number always tells where in the row the colony is, and this saves a good deal of walking where there are 25 or more colonies in each row.

The next letter in the record is W, which shows that the colony is weak. Next is the letter B, showing that they are short of stores. If they had had plenty of stores the last letter would have been A instead of B; and if they had been so short that it would be necessary to feed within two or three days, the last letter would have been C.

To explain my system further I will say that under some row we find this record: 98—E—W—A X. This says that the colony in hive No. 98 is at the east end of that row, and is weak in bees, and maybe they can use, so we can draw a frame of stores, and the record for that colony will be No. 8, whose record will now read thus: 8—M—W—B—A. The letter B being crossed shows that this colony has been fed, and the letter A after it shows that they have been fed enough to make them strong in stores. If we have crossed a wedge beneath them by feeding No. 8, and then only fed a small amount, then it would have read: 8—M—W—B—C—15. This says that they were fed April 15th enough to last them a week or 10 days from that date. If no honey comes in from the fields by this time, or before, we can tell by looking at this record-board what colonies have to be fed again, what rows they are in, and where in the row.

Later, if it is desired to equalize the colonies in
strength by drawing frames of brood from the strongest and exchanging them with weaker colonies, it is not necessary to spend a day or two in hard work examining each colony, for the record board shows the weak, medium and weak colonies, and tells just where they are.

Still later, the strong colonies may require more room, especially those that had a large amount of stores—the record shows what and just where these are.

At the beginning of the main flow, or when the supers are put on, a second board is taken and a new record begun. This board is marked off in rows to correspond with those in the yard, the same as the first one was. This second record also shows the strength of the colony and where it is. So at the end of the season these records show what colonies have swarmed, and about what each colony has done in the way of surplus work. Of course, this system of a cipher code or abbreviation keeps the management of the apiary from any endless variation: for instance, when examining the colonies the first time in the spring, if any are found to be queenless, a small x is placed under their number, and soon after they are united with weak colonies that have a queen so far I have decided that with me it does not pay to try to save a colony that loses its queen during the winter, for after the long winter confinement that bees are here subjected to, they live but a short time after being put out in the spring, and, before a queen can be secured from the South and new brood reared, they, as a rule, become so weak that they do not amount to anything that season, so far as surplus is concerned; and with a large number of colonies there is almost always a few that have a queen but are so weak that they are unable to build up in time for the white clover flow. A queenless colony united with one of these may enable them to build up into a strong colony for the white flow, so that anywhere from 10 to 160 pounds of surplus may be obtained, besides artificially swarming or dividing them so as to have, if increase is desired, two colonies in good condition for winter; and this of course may apply to two weak colonies that have queens, for although many have decided that it does not pay to use the queenless colony in the spring, I know that in my locality, under some conditions, it can be very profitably done; but if there is anything about our pursuit that requires skill and experience, it is, in my opinion, uniting weak colonies with profitably in the spring.

Southern Minnesota.

A Few Grains of Wheat for Honey-Gleaners.

BY ALLEN LATHAM.

It has been so long since I have sent any of my wisdom to the "Old Reliable" that I ought to have a good store accumulated now. So much straw has been sent that I think it is time for a harvest of grain.

Bees and Strawberries.

In this locality bees are frequently seen at work on strawberry-bloom in the season of bloom. They appear to get a little honey, but more frequently are gathering scant loads of pollen.

Honey and Pollen on the Same Trip.

The statement made some months ago that bees do not gather pollen while after honey, must be received by the bee-keepers of Massachusetts with great incredulity. In the season of clover especially do the bees here gather the two products. In some seasons the sections of clover honey are ruined by the accumulation of pollen in them. We are thankful that this does not happen every year.

Apple-Blossom Honey.

I am glad to see that this delicious honey has received its credentials. It is the most reliable honey we have for quality. With favorable weather a good crop is obtained every year of even date. The trees do not blossom evenly on the "off" years with this. The honey is a pale straw color. It is the heaviest honey we get. I have seen it so thick that it was almost gummy. It never dries. It is palatable on the day that it is gathered. This can be said of no other variety with which I am acquainted. I get two or three hundred pounds of apple-blossom honey every year. This on the day that the blossoms are about to open, or perhaps two days earlier, I fill the brood-nest full of syrup. This drives the bees into the sections. To make doubly sure that the bees go up to the vitamin in the syrup, I fill the super with syrup, in the super. This feed does not stay in the section, nor is it carried up. As every bee-keeper knows, the brood-combs get the first of the flow. If the combs are filled with the cheaper feed, then the honey is taken directly to the supers.

This flow from apple-blossom lasts only a few days, usually about 10; hence the necessity of getting the bees into the sections at the very beginning. This treatment will yield some thirty pounds of honey per colony. Some may express fear that the sugar will get into the sections and injure the purity of the honey. This does not happen. The syrup is ripened and placed in the brood-combs. It is difficult to get enough of the thist syrup. It prevents the bees from preventing considerable honey going there too. The syrup is poured into the empty cells of each comb from a coffee-pot. It diminishes greatly in bulk in being cured by the bees. If it is desirable to fill the sections, some cold rain comes on. Then a small allowance, as soon as clearing weather arrives, will probably drive the bees again to the sections, which they will have drawn away from during the rain. After the syrup has been used up, a new apiary filled with a few honey comb-cells: the bee-keeper will find beautiful sections of the most delicately flavored honey in the supers. In the corners of the brood-chamber will be found sealed syrup. It does no harm there as it will keep perfectly. I would advise every bee-keeper to run a few colonies with this honey, if he has not yet to get a choice honey for home consumption. My apple-blossom honey never goes into the general trade. It is all saved for home, friends, and a limited select trade. I sell it always at 25 cents per pound. I never have any left into the second summer.

Bumble-Bees in Winter.

Possibly the subject has been sufficiently hashed, but I will add my chop. Only the queens live through the winter. They crawl into a pile of leaves and lie inert till April or May. They do not become white, and the writer who found such "about ready to emerge" probably found the image of the June-bug.

The Tent for Mating of Queens.

This is the best yet. Now let us investigate as to how small this tent can be successful. If a drone has not been made the highest premium will be paid in the bee-yards. If a tent six feet in diameter will do, then that is what the small breeder wants. Some of us should hardly care to build a 30-foot one.

Tent for Breeding, Etc.

The "grain" that I shall now offer is worth its weight in gold. Having more honey in brood-combs than I needed, and a great number of unfinished sections, I wished a transfer fer. I loaded up a strong colony with supers of these sections. Then came the rab. Bees will not empty combs unless they are outside their hive. If outside the combs attract robbers. The problem was solved in this way:

My tent was made of five screens, each six feet square. This tent was without any bottom removed. Then the uncapped combs were placed within the tent as far from the hive as possible. These bees finished many sections. The work went on all through August. There was no honey in the fields, and robbers were fierce. They were taken by the score outside the tent, but never go up and in. The home bees quickly learned that to go away from home they must rise, and to return they must get above the hive and drop. This device is of wide application. The very best way of obtaining combs out of the bees trying to get out as the hive is left open. With a six-foot fence of mosquito-bar around the hive the advantage of the tent is retained and the worst feature gotten rid of.

If a weak colony is being robbed, try such a fence about it. You will be highly gratified with the result. Robbers will not get in—theY will try to enter through the netting, but not otherwise.
I am rather short of land space, and thought I would utilize my attic windows for hives. Two hives were placed facing each other on the east side of the room, with a small window to the entrance served for exit. Two or three small holes were bored through the glass at the top of each pane to let out those bees which left the combs during manipulation. As far as honey-gathering is concerned nothing is gained, more than to offset loss. In wintering much is gained. The two colonies have seen two winters thus. They have come through strong in each. Few bees were lost from the combs, usually vigorous. The combs come through without a spot of mold on them. It is delightful to open hives in which all the combs, even the outer ones, are dry and clean. This means rapid building up in the spring. The two in question are remarkably strong for the season.

I should state that I remove the covers and throw old clothes and papers over the hives for the winter. The attic is unfinished and is well ventilated. The results of this experiment are so pleasing to me that, at my first opportunity, I build a beehouse in which I can set 30 or 30 hives. This would be a tight, double-walled house with double windows. It would have ample ventilating facilities—this for dryness. The bees would get their rain by the entrances. An oil-stove would be set in the house on extremely cold nights, for I believe that extreme cold robs the bees of much of their vitality. There would be an arrangement to shade the windows when sunlight would do harm. Such a house would be simple enough in winter stores and in bees to pay the cost of it.

Introducing a Queen-Bee—Her Normal Good Graces the Key to Success.

BY W. W. M'NEAL.

I WOULD better, dear reader, impress you with the fact that the honey-bee in all her actions is governed more by cold business principles than by any feeling of love for kin or stranger. I have watched closely the habits of bees for years, and am old in the bee, but I have not yet come to believe that they are swayed by a selfish love only. Her motives may be good; and that from necessity she employs harsh methods. However, it is by her methods that we are fitted to judge; and, judging from these we say that her motives are unrelenting.

Let me cite a few prominent traits which characterize the honey-bee as being utterly indifferent to the sufferings of her kind, and to the perils of her sisterhood:

1. If the worker-bees love their queen, why will they, when this same queen becomes old and decrepit, allow a young, vigorous queen, and a stranger, to dispatch the mother-bee right in their midst? Not only do the workers positively refuse to assist the old and (to them) faithful queen, but when the bloom is on the stranger queen, they welcome her with the keenest relish to the situation she covets. When this same queen has become established in her new home, and is generous to the colony in the performance of her special duties, take her from the bees for a few short hours, or until they realize fully the loss of her. This will portray more clearly their real avaricious, grasping nature, and that love with them is an unnatural, impetuous passion. For night and day, they grumble to each other: the bees, note the results: The worker-bees ball her as they would a stranger queen; and in every way evidence a spirit of revenge rather than of rejoicing because she has left them to take to them. They appear to regard her sudden disappearance as a wilful shirking of high responsibility intrusted to her, and, accordingly, the most influential member of the colony is made to feel their indignation.

2. When a worker-bee has given its life in the defense of the colony, is it to be expected by some means regains the hive before becoming helpless, why is she at once dragged therefrom, alone to die?

3. The great, boisterous drone-bee, which was so tenderly cared for when his presence in the hive guaranteed the safety of the colony, finds himself in the midst of plenty; and within the immediate presence of the queen and worker-bees? If the honey-bees have that quality, or attribute—love—which higher intelligences are supposed to have, why do they always commit these fearfully cruel acts?

Gentlemen, from my observations of the honey-bees, I am inclined to think that love is for the mother-queen, or the peculiar scent of the newcomer, that have to do with the art of introducing a queen-bee. The key to success is in retaining the normal good graces of the queen—her influence—which the honey-bee is the greediest of the greedy, and the question with her is, apparently, Has the exchange of queens been a good business deal? Of course, there are exceptions, but this can abundantly be said to be the rule. The worker-bee is after the queen's tiny home, individuality is nothing further than to serve the colony in the advancement of its selfish interests. This principle is painfully manifest in all their doings. The stranger bee, whose physical force shall be his manipulation, is always welcomed thereto, until it reaches a period or condition in life which requires that it then be helped by the colony.

Let me call your attention to a few common occurrences in the apiary, which serve to make manifest the assertion that this is the ruling principle with the honey-bees.

1. Note, please, that young bees having just reached the zenith of their physical power and beauty, are, upon returning from a flight, allowed to enter almost any hive they choose. Surely these have not lost their identity—the distinct impress of the queen's scent during the little while they were out of the hive! Oh, no, nothing of the kind. It is seen at once by the elder heads within, that these are just the ones of helpful value needed; and so they are permitted to join ranks with them.

2. Note, that there is no fighting upon exchanging supers with two or more colonies, when honey is being stored. Why, then, is this and case of manipulation, to take them the peculiar scent of the queen of that particular hive? To be sure they do; but then they always carry with them what is of vastly more importance to the stranger colony—the fact that here is a company of able bees, and ample evidence in the shape of newly built comb and honey, of their willingness to work.

3. Note, that at swarming-time there is no fighting when two or more swarms unite, each swarm evidently feels that it is nothing to lose, but lots to be gained, by an addition to their forces.

4. Note, that any colony feeling the need of drones will welcome them to its hive; but when not needing their assisting bees, it will reject them at once; that a worker-bee laden with honey and pollen may, and quite frequently does, enter the hive of some near-by colony; and that a colony frequently calls its reigning queen when there has been no outside disturbance of the hive. Note, that when the mother-queen, or reigning queen, is found in an unexpected quarter of the hive, she is often sung by the workers; that a colony having a good laying queen will attend upon a score or more of queens in cages, promising that there shall not be lacking to the family the natural development; and that a virgin queen will be allowed to starve to death, her entreaties for food availing nothing. Now, why this partiality? Verily, the virgin is regarded as bringing with her no security to the colony, while the queen of the other class, so soon as it is seen that she will not, or can not, molest the reigning queen, is reserved unto future use should any accident befall that queen.

Please note, also, that the bees of a colony in whose hive there are so many caged queens, are just as able to pick out a robber-bee at the entrance as though there was but the one or reigning queen within. If it is the scent of the queen that entices them, or the understanding of what matter does the queen having the freedom of the hive, so impress upon the bees of her colony her own peculiar scent as to protect them against the depredations of theiang bees? My bee-keeping friend, I believe that all this matter of the queen's scent is but a vapor cloud, and in due time will have blown away.

I will repeat that the key to success along this line of introducing queen-bees consists in having the queen in the best possible physical condition at the time she is to be given to the colony. She must be the peer of the colony—must be equal to their expectations. Not only must the queen's scent—evidence of the latter's—manifest a willingness to do the same. Is it not enough to break the even tenor of her ways—the worker-bee's—to take away the queen in the prime and beauty of life, and offer instead, a poor, half-starved and frightened little queen to fill the place made vacant?

I have exchanged the queens of two colonies during the
season of surplus, and had each laying in the hive of the other within an hour of her removal. It is this way: Catch both queens, and then close the hives; smoke each colony a little from the entrance, and then run the queen into both to supply my own tables with home, but I had so many calls for honey that I decided to increase the number of my colonies. I now have 25, but that is not enough to supply my trade, which is growing larger each year.

I have quite often seen this question asked, in the bee papers, as to what cause you think is best to divide swarms? I do not believe that's the best way to divide. It's one of the easiest ways, but not the way for best results. If you leave the queen on the old stand with half the brood, that part ought to do good work, but the other half will have no field ready at first, and will be in a discouraged condition, which is not the best thing for rearing a young queen. You could use the nucleus plan without making very frequent visits, and have a chance for better queens. Or, here is a way that might suit you, with no nuclei in the case:

Get some good cells started, and when they are within three or four days of having the young queens emerge, make your divisions. Take from a colony all its brood but

very strange when I say that he never entered a complaint against me.

If you will take another look at the picture you will see my two "swarm-catchers" standing at the end of the rear row of hives. They are not the automatic or patented kind, but as swarm-catchers they are a success, because they have not let one swarm get away. If a swarm issues, they are sure to see it; they first notice which hive it came out of, and then there is a race to the shop to see which one will sell me that the queen is swarming. I have sold these "swarm-catchers" by the hundreds.

Questions and Answers.

CONDUCTED BY DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Detecting Queenlessness in a Box-Hive Colony.

I have a box-hive in which is a large colony of bees. It wintered well, but seems to be at present without a queen. How can I tell that they have none? WISCONSIN.

Answer.—Give the bees a little smoke, turn the hive over, blow smoke down between the combs, putting them apart at the same time, and if there is no queen, you will be able to see sealed brood. Another way is to get from a movable-frame hive a piece of young worker-brood and crowd it between two combs so it will be held in place. Two days later if you find no queen-cells started on this brood, you may safely conclude they have a queen. If they are queenless, the bees are very old, and unless quite strong they are not worth a queen.

Dividing to Prevent Swarming.

I have moved 30 colonies of my bees three miles up the creek, right in the midst of hundreds of acres of alfalfa. Now I plan to divide them just as soon as the alfalfa commences to bloom, as I will not be able to watch for the swarms. I wish you kindly tell me whether I can just scatter starters of honey and bee brood-frames in the frames I put in, or must I have full sheets for fear they will make drone-comb? The way I thought to do was just to take out half of the frames of brood and bees and put them into a new hive, and then fill in the vacant spaces with frames with starters on them. Of course I have young brood and eggs if I do not know they have a queen.

A year ago last winter I visited at the home of a sister of yours, in Denver, where I learned so many pleasant things about you, and Miss Wilson, too, that I feel quite as if I knew you, and that you will not laugh if I do ask foolish questions; I have nearly 300 colonies of bees to care for the coming summer, and all I know about bees is from reading. I have never even seen a properly conducted apiary, but I have managed to have this many bees with only 5 colonies to start with in 12 years, with only one year's failure, when most of my bees died during the winter and spring. I have very few new swarms of late years— I think it may be because I have so many bees in one place—150 colonies or more.

COLORADO.

Answer.—If you divide the way you propose, you just must put in full sheets of foundation if you do not want a considerable part of your bees going on swarming. Of course, I don't believe that's the best way to divide. It's one of the easiest ways, but not the way for best results. If you leave the queen on the old stand with half the brood, that part ought to do good work, but the other half will have no field ready, and will be in a discouraged condition, which is not the best thing for rearing a young queen. You could use the nucleus plan without making very frequent visits, and have a chance for better queens. Or, here is a way that might suit you, with no nuclei in the case:

Get some good cells started, and when they are within three or four days of having the young queens emerge, make your divisions. Take from a colony all its brood but

Biographical.

JESSE M. DONALDSON.

On our first page this week is shown Mr. Jesse M. Donaldson, of Franklin Co., Mass., and his nice city apiary. He gives the following account of himself and his bee-keeping experience:

My first lessons in bee-keeping were learned in the early '70's, in the apiary of my uncle, James P. Sterritt, of Mercer Co., Pa. At that time I intended to become a bee-keeper, but, like almost all other boys, I had a desire to travel and see some of the world.

Nature had endowed me with very flexible joints, so I concluded to take advantage of that and become a professional acrobat and contortionist. In that line of business I visited every State in the Union, also Canada, Newfoundland, Mexico and Cuba.

I was married in May, 1886, and a few years afterward decided to quit the show business and "settle down." With that object in view I found employment in the shoe factory where I now live.

Soon after settling here I became afflicted with that old disease—bee-fever. As it was the second attack, I knew the only remedy, and applied it at once by buying a colony of bees. The advertisement in one of my bee-papers that read something like this:

FOR SALE—400 colonies of Italian bees in 10-frame Langstroth hives, all in good condition. Price, $4.00 per colony, on board the cars here. Reason for selling, sickness.

I sent my $4.00, and in due time received the colony of bees, which I examined as soon as possible. When I saw the inside of that hive I began wondering which it was, the bees or the advertiser that was sick. If that colony was a fair sample of the other 399, it is no wonder that he was sick.

Some of the frames were minus an end-bar, others had no bottom-bar, and the whole 10 frames did not contain enough worker-comb to fill six frames.

When I bought my first colony, I intended to keep just enough bees to keep my family and home in honey, but I had so many calls for honey that I decided to increase the number of my colonies. I now have 25, but that is not enough to supply my trade, which is growing larger each year.

I have quite often seen this question asked, in the bee papers, as to what cause you think is best to divide swarms? I do not believe that's the best way to divide. It's one of the easiest ways, but not the way for best results. If you leave the queen on the old stand with half the brood, that part ought to do good work, but the other half will have no field ready, and will be in a discouraged condition, which is not the best thing for rearing a young queen. You could use the nucleus plan without making very frequent visits, and have a chance for better queens. Or, here is a way that might suit you, with no nuclei in the case:

Get some good cells started, and when they are within three or four days of having the young queens emerge, make your divisions. Take from a colony all its brood but

very strange when I say that he never entered a complaint against me.

If you will take another look at the picture you will see my two "swarm-catchers" standing at the end of the rear row of hives. They are not the automatic or patented kind, but as swarm-catchers they are a success, because they have not let one swarm get away. If a swarm issues, they are sure to see it; they first notice which hive it came out of, and then there is a race to the shop to see which one will sell me that the queen is swarming. I have sold these "swarm-catchers" by the hundreds.
one frame, and in this case you may use only starters, and have a fair chance for little drone-comb. That leaves on the old stand the old queen and the field-force, and if the colony is very strong you may risk shaking off a few of the bees from the old hive from the frames you remove. The old bees will return to the old stand in a day or two, and it might leave the new colony with hardly enough bees to care for the brood, so it will be safer to take all the adhering bees with the conical frame from the old hive. Two days later take the remaining frame of brood from the old colony, and at the same time give to the new colony a sealed queen-cell. I have a suspicion that you are not anxious for increase from these colonies, but instead to divide them because you know they will die if you do not divide. If that is the case, your plan is easy: Just before there is any danger of swarming, remove from its stand a hive and put in its place a hive filled with foundation, putting the queen in this hive. Then it will be found that in the course of your experience you may count on freedom from swarming, unless your experience is exceptional, and you can make your increase nearer home where you can have it directly under your eye. You will readily understand that 2 or 3 days after opening it will be no work to make a similar box by the lower story. There may be some drones in the upper story that can not escape, but I have found this trouble more theoretical than real. The remains of the drones will be there the first time you open the hive, and you can easily shake them off the excluder.

Don’t be afraid of asking foolish questions. Bless your heart, if you can study up any more foolish than this, I don’t think you can. In the course of my experience you must be an adept in the line of foolishness. The worst of it is that in my case I haven’t yet outgrown it, and expect to make more or less blunders as long as I live. I confess to you (but this is only between ourselves) that I do sometimes feel quite inadequate when one or two questions that are plainly answered in every text-book published; but when one has studied the text-books carefully there will still be always plenty of questions to be asked, and with such I am quite willing to be flooded—glad to answer them just so far as I know how. And this suggests to me that you may ask why leave that one frame of brood instead of taking all, and then why take it away later. If the bees are left with larder entirely bare, they may desert the hive, and if the frame of brood is not taken away within a few days they may prepare to swarm. If you ask why they will swarm if that one frame of brood is left, I may explain that—that is—well, the fact is I don’t know.

Using Old Combs—Getting Increase—Italians vs. Blacks.

1. Will the combs of a colony of bees that died with the dysentery do use again?

2. I have 8 colonies of bees which I wish to increase to 20. Would you advise dividing, or natural swarming?

3. Are the Italians more apt to have dysentery than the blacks?

A. In losing 3 colonies that is made of tiny close material. When the weather is cool this will matter little, but on a hot day it would be very uncomfortable, and to wear it all day long on such a day would be, I judge, quite a trial. I would advise you to wear a cooler or closely woven material. It is quite clear that you have one on for some time on a hot day, for I find it better fit for you.

I doubt whether you would dislike his way of smoking bees before opening a hive, if you were actually to see him at work, for it is not very likely he does just as he says. It is quite common to say that a man preaches better than he prac-tises, which is, I think, only a part of the truth; it is better than the preaching, and no doubt writing away from the hive he had not in mind as clearly as he might just what his practice was. Taking it, however, just as it reads, his first act was to blow smoke into the entrance for about 30 seconds, working the bellows with slow, steady pressure so as not to alarm the bees with the noise of quicker motions. Just what is meant by that last I do not fully understand, for it is hardly possible that any noise made by the smoker can alarm the bees a tenth part as much as the horrible flood of smoke that many of the bees have never before experienced. Indeed, the very object of the smoke is to calm the bees.

I very much doubt that in actual practice Mr. Gehring blows smoke into the entrance for 30 seconds, first starting “a good volume of smoke.” I have just been trying it by the watch, and working the bellows what I consider a slow, moderate, steady, smoke for 30 seconds, and dry puffs when putting at the usual rate. That would certainly be an unnecessary amount of smoke, in some cases driving the bees out of the hive, and in any case frightening the bees so much that if it would be necessary to wait a few minutes for the bees to get themselves. A “few minutes” would hardly be understood as less than three minutes. That would leave the bees in good condition to handle, but the smoker would hardly feel he had nor to take so much time. If I may be allowed to refer to my own practice, instead of taking 5 minutes from the first puff in the entrance before opening the hive, I do not take one-sixtieth of that time, for the bees are all that are given, when, without waiting a fraction of a second for the bees to get themselves, I immediately open the hive, giving them two, three, or four puffs on top of the frames. That will usually be sufficient; but if at any time the smoker puffs in 30 seconds, and the humming noise spoken of is a proof of thorough submission; I would hardly consider it one of “satisfaction,” but the opposite. Neither would I want to have the bees proceed to much of a humming noise unless I wanted to drive them out.

Gehring’s Bee-Veil and Way of Smoking Bees.

I have been reading Mr. Gehring’s series of articles now running in the American Bee Journal, but not quite like his bee-vill, nor his way of smoking bees before opening a hive. What do you think of them, Doctor?—BUNGHAD.

ANSWER.—The bee-vill described by Mr. Gehring in his very interesting articles will answer a very good purpose, although is objection is its bulkiness—it is quite close material. When the weather is cool this will matter little, but on a hot day it would be very uncomfortable, and to wear it all day long on such a day would be, I judge, quite a trial. I would advise you to wear a cooler or closely woven material. It is quite clear that you have one on for some time on a hot day, for I find it better fit for you.

I doubt whether you would dislike his way of smoking bees before opening a hive, if you were actually to see him at work, for it is not very likely he does just as he says. It is quite common to say that a man preaches better than he practises, which is, I think, only a part of the truth; it is better than the preaching, and no doubt writing away from the hive he had not in mind as clearly as he might just what his practice was. Taking it, however, just as it reads, his first act was to blow smoke into the entrance for about 30 seconds, working the bellows with slow, steady pressure so as not to alarm the bees with the noise of quicker motions. Just what is meant by that last I do not fully

Bees Cross at Swarming-Time.

I purchased 3 colonies of bees in the fall, and the person delivering them put them down in the most convenient place, and I let them alone until I could familiarize myself with them. I came home in the forenoon of April 20th, and found they had swarmed (about a peck measure full), so I have made a virtue of necessity, and went about it according to the formula in the "ABC of Bee-Culture." I got a hive with full frames of foundation, laid it down on the top of a sheet, got a box and a turkey wing and went to sweeping them into it (as they do after the top rail). I got some of them into the box, but it did not take me long to tumble what I had in the box down in front of the hive, and make a very hasty retreat.

Now I take it for granted that there was something wrong with my manipulation, for Mr. Root says that they would be so full of honey that they would not fight, but I need not tell you that I am nursing my wounds yet. I had
a brand new smoker, and got it out, but really did not know what to do with it. I got some rags, lit them, and went back in fear and trembling. I gave them a good smoking, took the same box (with a long-handle this time) and a long-handled brush, and got out the bees, dumped them down again in front of the hive, and when they would not go in I smoked them in, and they stayed.

TENNESSEE.

Answer.—It is true that bees swarm they are filled with honey, but very soon after that they may hive their bare-headed and bare-handed. But it is also true that sometimes they are cross enough, just why I don’t know. Very likely there was no fault on your part, only you had one of the “sometimes” cases.

Transferring Bees.

Several weeks ago I bought 5 colonies, and found 2 of them very strong, and consequently did not disturb them. Two of them were very weak, so that only one frame could be covered in one, and two frames in the other. It happened that the old home-made frame fit in the new dove-tailed hives which I use, and so I put them into the new hives.

1. Now, would I not better take from them both queens, and unite them into one hive, then give them a new queen? I then have the queens united.

2. Now, the fifth hive was a mess—it was chock-full of honey, and although it was a movable-frame the bees had built their combs diagonally in the frames. I began to cut out from one side where there were no bees, and proceeded until I hit the fifth frame, when I came to the bees, then I lifted the remaining frame, and got the bees out of the fifth frame, and made a new hive. How can I get those bees out on straight combs? Would you advise leaving them and gradually coaxing them over on new frames filled with foundation?

Penn.

Answers.—1. As your letter is written in April, it is quite possible that a colony very weak at that time may build up to good proportions by the time of the honey harvest. At any rate, it is a common observation that if a colony has been started this fall, and has been in a good condition as to building up, the united will hardly do any better.

Are you sure about the queens being old? If you are experienced in such matters you may judge somewhat by the appearance of the queens, but even then you may not be sure. If a colony threw out a swarm last year, you may know it has a young queen less than a year old. The swarm will generally have an older queen, although there may be exceptions. Generally, however, the bees will supersede a queen before she is old enough to be worthless. Very likely you will do well to leave the two colonies as they are, unless you want to introduce a new queen for the sake of improving the stock.

2. Yes, fill up the hive with frames filled with foundation, and let the bees work over upon it at their own sweet will.

Weak or Queenless Colony.

I have 2 colonies of bees, and both seemed to winter well, but I notice this morning a great many dead bees in front of one of the hives, and that colony seems weak and not nearly so active and strong as the other. What is the trouble and the remedy?

Alabama.

Answer.—It may be that there is nothing beyond the fact that the colony is weak. A good many bees die every winter, and some strong colonies will keep them, carried away so that you may think that none were lost, while a weaker colony may leave them on the floor of the hive or at the entrance. The chief question is whether there is a good chance for some of the young—the second part—my bees are not the old queens in the second frame, and if you find nothing of the kind there, you are hopeless queenless, and the bees left are so old that they are not inclined to fuser with. There is a bare chance, however, that they have reared a young queen that has not begun laying yet. In that case you may find no brood except a little sealed brood. If you want to make sure of it, give them a frame of young brood from the other colony, and if they start queen-cells on it you may believe them queenless; but if no queen-cells are started in two or three days, there is still hope they may have a queen. If they start cells, and they are sufficiently strong in bees, you may allow them to mature the queen-cell, but the game is not likely to be worth the candle. If you find the sealed brood in worker-cells raised like little bullets instead of being flat, you may know they have a drone-laying queen or flying-workers, in which case the only thing to be done will be to destroy them.

The Commonplace.

A commonplace life, we say, and we sigh;
But why should we sigh as we say?
’Tis the commonplace sun in the commonplace sky
Makes up this commonplace day;
And the moon and the stars are commonplace things,
And the flower that blooms, and the bird that sings;
But dark were our fate, and sad were our lot,
If the flowers should fade and the birds sang not.

Oh, God, who watches each separate soul,
Out of commonplace things makes this beauteous whole.

—Selected.

“DAD BUTTER” HOME COURTESIES.

This would seem a curious text for our greeting to “The Home Circle’s” friends. Yet it suggests some valuable thoughts, as we see.

I taught my first school when I was young—in my teens. How vivid are some of the things of our childhood and youth! How stamped upon memory was the ride—11 miles—with my dear old father, as I went to try my skill at the teacher’s desk. Among other wise things my father said was, “Start right.” That might well be a text for any epistle or sermon. Again, “Never lose your self-control.” A man near Claremont was shot yesterday—another man lost his self-control. The one will be marred through life, if not worse. The other will doubtless languish for months behind prison doors, and will have long, bitter, regretful thoughts. Did I say too much in a previous article? Can we say too much to our dear children at the very first, from cradle up, regarding the importance of self-control? I am glad my father impressed it upon me that memorable ride, as I went to fashion the still younger lives.

Again, my father said, “Never be callous in the morning.” I was to “board around,” and such evidence of energy he thought would win me favor. I think I was never called, and I was often first up, and in the quiet of those early hours I not only carefully read my New York Tribune (which was a good school for a school-teacher), but also read during the winter Irving’s “Life of Washington.” Whatever some may think of this advice, its results were certainly good in my case.

Again, father urged that I use no words that I would not use in the presence of the most refined ladies. This was good advice. I hope I followed it. Were I to train children to-day—were I to bring up my children again—I would start urging the “yea, yea,” and “nay, nay,” which the blessed Master enjoined upon all his disciples. There is something so sweet, wholesome, and impressive in the pure, direct speech, especially in these days of slang, that I wonder more are not more popular.

But why my text? I often noticed as I boarded with the good people, that the language of the children was not always courteous, respectful, refined. The people were for the most part—indeed, almost in their entire—through good people; people who would sacrifice heavily to aid a neighbor who might need comfort or assistance; people who prided themselves upon their honesty; whose word was honored in matters of common report, or in business. It was a neighborhood that would sooner empty itself in case the country should be threatened and assistance required. This was proved two or three years later, when the call for 100,000 men was sounded by that glorious man who then guided the great “Ship of State.” It was a goodly folk to meet, and I used my opportunity and dwelt among them poor and rich alike. No home escaped my visitation. I have rejoiced ever since that the poorest and least respected
The "Old Reliable" seen through New and Unreliable Glasses. By E. E. HASTY, Sta. B Korall, Toledo, O.

THE UNCAPPING FORK.

If the implement known as the uncaping fork has been in use 20 years, and has occupied all that time in getting itself heard of on this side of the world—well, one would say it can hardly be of very great value. Perhaps that’s not the way to look at things, however. At any rate the slowness of truth which attended a product of the 18th century is certainly a match. This is anest those pictures furnished by Mr. Griener, on page 215. All tools for uncaping, one would say, which operate like a garden- rake, and draw all they get hold of in front of them, must manifestly be self-clogging and too slow for general business.

THE UNCAPPING ROLLER.

How about that, roller fail of fine pickers to puncture the cappings instead of removing them? Can it be depended on to let go of the cappings? The pickers must be near together else some of the cells will be missed; and if near together will it not, first you know, pull off small patches of capping and hold on too long and the rollers snap. I have a little pricking arrangement not a roller which departs itself in about that style: and picking things clear is an unendurable waste of time. Perhaps a rolling motion instead of a patting motion would do the business whole or in part. I fear not, however, that the uncaping roller is one of the Galatians—"run well for a time"—and short time at that. It is by no means absolutely necessary that an uncaping device should remove the cappings at all. It’s nice to have that done; but if the new device works rapidly enough, and well enough, we can afford to float out the cappings with the inverted syphon, or lift them off the gravity tank. There is another thing to be thought of, however. If we give back most of the cappings to the bees, there may be a temptation to throw away the most of them, to the serious loss.

MR. CHAPMAN’S METHODS AND MANAGEMENT.

The long article of S. D. Chapman, pages 215–217, very valuable as it is, needs lots of discrimination on the part of the reader. Things which will work in one locality will not in another; and any one of two or three operations may work well when the most captivating member of the series, turned out and used alone, might be ruinous. Or, again, take the plan of killing all queens early in July—the man who overworks his queens so that they do not have more occasions to suffer than the man does whose bees run their brood-rear as according to their own sweet will—albeit there are some other reasons not directly connected with premature old age.

The idea that queens will lay much faster in the middle of the brood-nest than in outside combs will come to some of us as rather a novel one. It is quite likely to be correct; and if correct it is a large-sized item to conjure with.

Another prominent idea is not exactly new, but one which many of us have entertained (perhaps a little sheepishly or clandestinely) that the time spent on very weak colonies in spring is time thrown away.

I note that he does not claim for his diligent taking out of brood and putting in of empty combs that it doubles the size of the colony, nor yet doubles it, but only puts it 40 percent to the good. It is of value to have the experience of an expert that a dozen queens hatching in an upper story do not necessarily make the colony swarm. I believe it has been said that one queen is enough both for section-honey and extracted is a practice poor if not un economical. Here we have a forecible and plump denial at strong hands—more bees, and more comb honey, and some extracted honey as so to free grade.

Raspberry bloom and berries in all stages in northern Michigan up to November 1st, is simply another of the many evidences that last autumn was a very abnormal one indeed.

That out of 140 colonies 50 should neglect to start cells when queens were killed, until brood was all too old, is a very strange experience. Good case to bear in mind as evidence that “one can’t pretty much always tell” what bees will do, or what they will not do.

AMERICAN Bee JOURNAL

May 16, 1901.

The "Hum of the Bees" in the Apple-Tree Bloom is the name of the finest bee-keeper’s song—words by Hon. Eugene Searc and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Searc and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

The Premiums offered this week are well worth working for. Look at them.

QUEENS!

Improved Golden and Leather-colored Italian queens are what H. G. QUIRIN
tears in. We have one of the longest Red-Clover Breeders from their 12000 queen, and
a Golden Breeder from Dollittle, who says it is a BREEDER OF SUPERIOR STOCK.
It is a fact that 12000 queens reared in the U. S. during
this one is worth that sum. The above breeders have been the origin of our already im-
proved strain of queens for the coming season.
J. L. Gundl, of Humboldt, Neb., wrote as on Aug.
5th, 1906: "It is my opinion that, having one
of our queens had already stored over 400
pounds of honey. Under these circumstances
he stated that he is certain that our bees work on Red
Coves, as they were the only kind in his locality and
apart.
A. I. Root's folks say that our queens are extra-
ordinary, while in the American Bee Journal tells us that he has good reports from
our queens from time to time. We have
files of unselected testimonials.
A pure Italian royal jelly, feed, are

WINTERED ON GRANULATED SUGAR.
Mr. Gill, a beekeeper here, put a colony on
nothing but granulated sugar in the fall, and

Bees Expelling Water from Nectar—Fruit-Bloom Honey.

Prof. Cook says on page 119, in his "Review of A. B. C of Bee-Culture": "I have always wondered at the statements we so frequently see of bees expelling water from the honey while on the wing. I never saw it, and I don't believe they do it," etc.

I was indeed surprised to read this from Prof. Cook. I have seen bees expel water from the honey as they left buckwheat fields for the hives, and I think all doubt will be removed when it is tried. If those who do not believe it if they will get bees to work on a piece of comb containing honey as bee-hunters do, they have some of that water that it will be only sweetened water, but sweet enough that the bees will work on it. If you watch some of this into a empty comb, remove the original comb, and place the watered honey in its place. Watch these bees, and then after ex- pelling a quantity of the load in the form of water (soon after leaving the box, and always before she got out of sight), make the trip of one or two miles, and return in much less time than when a thick syrup of honey was used for ball. All good bee-keepers know this.

On the same page Prof. Cook speaks of Mr. Root being in error about fruit-bloom honey. I think this is Mr. Root's great mistake of this, and he acknowledged his mistake. I have seen hundreds of pounds of pure apple-bloom honey. Ship in May, and I think I have had a few cases of comb honey gathered from it by my own bees. With the exception of raspberry honey it is the best produced in the State.

Worcester Co., Mass. JAMES F. WOOD.

Three Hive-Bodies Per Colony for Extracted Honey.

On page 137 I read the questions on ventilating supers, and then I read Dr. Miller's replies, and was very glad to find that I was walking to some extent in the footsteps of some of the bee-keepers who have run entirely for extracted honey, and for every colony I use three 8-frame dovetailed hive-bodies in the super. After the bloom, when the summer stands in two hive-bodies each, and in the spring I feed so as to cause all to swarm. The parent colony in my apiary is left all summer by the old stand, and facing at right angles to it, and when it is re- quired to go out, but before the bloom issues I put a ventilator under the old colony, about 1½ inches deep, about three days after they swarm I examine the parent colony, take it with eight of the frames that are nearest to being empty, and put it on top of the new colony with a honey-board between and another ventilator on top 1½ inches deep. So you see there is plenty of ventilation, but in case of a stoppage of the honey-flow I am not afraid of the honey getting too hot.

My principal reasons for using three hive- bodies to the colony are as follows:

1. I do not want to go out to get warm air after the blooms are over. I will send the bees to a little strip along the top of each comb in the bottom story. This method of doubling up every fall I have the same number year after year, and do not have so many come to protect from pests.

We have had a very mild winter, and bees have flown at least one day in every week, and now I have them busy engaged in casting artificial pollen to the hives. I use one to five pounds of flour a day mixed with flaked oatmeal, and they visit it by the thousands, and I expect the hum of these bees would beat the "hum of the bees in the apple-tree blossom." A few miles from a crop made from 20 pounds of the best granulated sugar, 40 pounds of water, and 15 pounds of honey to a barrel, and a few weeks after the bloom, the next week, my work will be over for awhile.

W. H. ALDER.

Callahan Co., Tex., March 4.

More Rain in California.

It began to rain last night, and up to the present time has been the wettest period in April in the San Francisco basin, about four days earlier than last year. Then we had a cold, wet time, killing all the early blossoms, for two weeks, and now the bees have a hard time to live, as they had a quantity of brood—in fact, it has been the wettest April for bees that I can remember. The past few days everything has been coming rapidly forward, and the trees are in bloom. It is looking like spring, and there seems to be no nectar in the blossoms. I have made a few improvements or discovering since my last report, and will write about them later.

D. H. METCALF.

Worst Spring for Years.

My bees came through the winter seemingly stronger than when closed up in the fall. They made a good showing in April, and four days earlier than last year. Then we had a cold, wet time, killing all the early blossoms, for two weeks, and now the bees had a hard time to live, as they had a quantity of brood—in fact, it has been the wettest April for bees that I can remember. The past few days everything has been coming rapidly forward, and the trees are in bloom. It is looking like spring, and there seems to be no nectar in the blossoms. I have made a few improvements or discovering since my last report, and will write about them later.

D. H. METCALF.

Report from the "Old Dominion."

I began the season of 1901 with 47 colonies, seven spring, count and increased to 52, working on Doddle's plan of spreading brood. I met with perfect success in using that plan, securing populous colonies which were in readiness when the honey-flow came. We destroyed all drone-comb in colonies in we did not wish to parent, and used the best and the best drone-comb and the best drone-comb, and also some from the colonies with the best layers and honey-combs. We have worked very hard.

Our honey season was tolerable good during the months of June and July, when our bees gathered the most surplus. During August and September the bees did not do so much, but the latter part of September and the first of October they laid in a good supply for winter, and we had a good sugar-brood, and some surplus from sweetwater.

We tried the golden plan on one colony, and it worked well. It adopted to some extent during this season. We want to increase to 65 or 75 colonies. Many of our bees have been weakened all winter all right with the exception of two that became queenless, and we have 48 colonies now. During the month of February the weather has been very mild and pleasant, but it doesn’t look now as if we were going to have much more. Over the season as the snow is flying in all directions,
end the mountains around about us are clad in miles of snow.

Our crop last season amounted to over 10,000 pounds of comb honey (we do not extract any honey, which we consider pretty good for the season, as was a drouth which cut our corn crop short by over one-half."

P. F. Huffman.

Rockbridge Co., Va., April 22.

Clipping Queens’ Wings.

G. M. Doolittle enumerates the advantages in the American Bee-Keeper, viz.: Greater ease of finding a clipped queen in a hive; security against runaway swarms; freedom from keeping two or getting two from distant places. Either one of which might be sufficient reason for the practice.

Queens Fating in the Hive.

This is reported in Gleamings in Bee-Culture by H. L. Jeffrey as a success, but Editor Root thinks there may be some mistake about it.

A Swarming-Stick.

For those who depend upon having their bees settle so as to hive them, it is by no means a pleasant thing to have the swarm on a very high tree, or in the middle of some thorny shrub, tree, or hedge. Mr. J. F. Mun
day has this to say about a “swarming-stick” which he uses:

It is therefore advisable for a bee-keeper to prepare suitable places near his apiary for his hives to settle on. The plan I adopted was the following: I bored an angle-hole in the top rail of the fence which enclosed my apiary. I fixed a stick about two feet long, one end of which would slip into the hole made in the rail; on the other end of the stick I fastened a small bag of dry grass about the size of a small pumpkin. Before making the bag, I placed the material of which it was made (a piece of burlap) on the top of the frames of a hive of bees for a few days to obtain the scent of the bees on it. Well, I simply placed this stick with the little bag of grass on it in the hole made in the rail of the fence, and I had the satisfaction of seeing my swarm settle on it, or rather them, for I had four of them in different places.

Now, I do not wish to imply that all my swarms settled on those prepared places, for they did not, but the majority of them did, and when they did, after placing a hive ready for their reception, I gently removed the stick with the swarm on it from the hole in the rail and carried it to the hive. With another little stick I carried, or with my hands if I had not gone. I always took a few bees from the cluster, letting them fall at the mouth of the hive, and when I noticed them entering the hive satisfactorily I shook off the rest of the swarm, and when most of the bees had entered the hive I returned the swarm-stick to its place in the fence again.

Foul Brood—An Important Subject.

Every little while there comes a frantic inquiry from some bee-keeper to know what is the matter with his bees, and what he shall do for them. He suspects the presence of foul brood, but has always skipped it in his reading—let those troubled with the disease trouble themselves with the reading. The wise bee-keeper will not wait till he is per-

OIL QUOTATIONS. 3.-Fancy white comb honey we quote at 15c per pound. 4.—Fancy white comb honey for export, f.o.b. Chicago, 15c; f.o.b. Rockford, 16c. May be sold for 15c.

BEE SELLERS.

Cincinnati, Apr. 19.—The demand for comb honey is nearly over. The stock of it also well cleared. Fancy white comb honey has been pretty uniformly sold, and the price of it is firm and steady. All the comb honey is now on hand, and the demand for it is small.

KANSAS CITY, May 4.—Practically no shipments arriving, and very little selling. We get our supplies at 15c per pound, and sell fancy white comb honey for export at 16c.

ALBANY, N. Y., May 3.—Honey market very dull. Very little call for anything but choice comb honey, of which there is a scarcity. Ex- tracted quick.

BOSTON, May 4.—Fancy white comb honey we quote at 15c. A No. 1, 15c; No. 2, 16c. No call at 15c for dark honey. Reports are that supplies of white comb honey and dark comb honey are very scarce.

SAN FRANCISCO, May 1.—White comb 11@ 12 cents; amber, 80@85; dark, 60@67. Extracted white, 95@97; amber, 80@85; dark, 60@67; fancy white, 100; fancy amber, 85@90; fancy dark, 85@90; fancy white, 100.

The market inclines in favor of buyers, with considerable honey offering, spot and lots, and the inquiry not very active. There is some of last year’s honey still in stock, one of our firms reporting as having about 3 car-loads, including comb and extracted.

Our market on comb honey is firm with light stocks and at fairly good prices, for the same time of the year.

BLAKE, SCOTT & COE.

AMERICAN BEE JOURNAL

GEORGE W. YORK, Editor.

CHICAGO, ILL., MAY 23, 1901.

WEEKLY

FORTY-FIRST YEAR

No. 21.

APIARY OF MR. J. B. ALEXANDER, OF PULASKI CO., ARK.
(See page 326.)
Weekly Budget.

Dr. Peirce has removed to 75 State Street, Chicago, opposite Marshall Field's, where he would be pleased to see friends of the American Bee Journal at any time when they are in the city.

G. M. Dollittle, "gets off" the following in one of his editorials in the Progressive Bee Keeper for May:

PACKING POLLEN—An amateur beekeeper once told how this was done in these words: "When a bee brings pollen into the hive, she advances to the cell into which it is to be deposited, and kicks it into another bee; one of the indoor hands, comes along and rams it down with her head and packs it into the cell as the dairymaid packs butter into a frirkin. The paper publishing, said, "We prefer not to have any dairymaid pack our butter that way." An editor seeing both of the above, remarked, "If our butter must be packed in that way, let it be done by a bald-headed queen as it is not possible to keep them all." and after reading all the above, ventured, "We will add that in either case it would be "dand-ruff" on the butter."

DAFT CITY FATHERS—The Daily Camera, of Boulder, Colo., for May 4th, contained this paragraph which is of interest to beekeepers:

"Our neighbor, Longmont, is beginning to feel quite metropolitan. She has passed an ordinance to keep cows off the main street and now tackles the bee question. Hereafter no person shall be allowed to keep more than 4 colonies of bees in the corporate limits. This ordinance has caused a humming and buzzing beside which the noise of the bees was as nothing. The matrons and farmers of the town are up in arms and really it looks as if the town council is putting on unwanted airs. Why banish the busy bee and the luscious honey?"

It must be that Longmont rulers think their city needs a charming look or something and that they must do what they can to keep them down, or drive them out. Instead of trying to encourage an honest and honorable industry there seem to be people who prefer to destroy it entirely. But we can hardly believe that a majority of the residents of Longmont will permit such an imposition upon their beekeepers as the one suggested in the foregoing quotation.

MR. MACKENZIE, THE PROPOLIS MAN—Those who attended the National Convention at Chicago last August will recall the discussion of the question as to the practical use of propolis, or whether it has any commercial value. A man by the name of John MacKenzie, of Troy, N. Y. was present with samples of leather and furniture polish, in which propolis was a prominent ingredient. We believe he offered to pay 50 cents per pound for propolis, saying that he expected to be able to use it in large quantities.

It seems that Mr. A. G. Wilson, of Vernon Co., Wis., sold Mr. MacKenzie a quantity of propolis, but he could not make any use of it for the purpose for which he purchased it. He wrote us during the winter about it, asking us to do what we could to help him get what Mr. MacKenzie owed him for the propolis. We wrote the Troy man, but received no reply. A few weeks ago Mr. Wilson again wrote us, when we again wrote MacKenzie, saying that if we did not hear from him within two weeks we would mention the matter in the American Bee Journal. We are now simply keeping our promise to him. Mr. Wilson, writing us May 8th, gives the following facts:

FRIEND YORK—On or about Nov. 1, 1900, I sold and shipped to John MacKenzie, of Troy, N. Y., 65 pounds of propolis at 25 cents per pound. After waiting a reasonable time for settlement, I wrote and reminded him of the shipment and the amount due which he made no reply. I then drew on him in New York, and you will see the results (dishonored drafts, etc., are enclosed). I have not heard from him in any way since. That is all the propolis to him. The propolis was sold through a sample sent to him, he agreeing to pay for it the price I set, which was approximately 25 cents per pound.

We do not know whether there are any other beekeepers who have been so unfortunate as to have shipped any propolis to MacKenzie. We trust not. We were hoping that Mr. MacKenzie was all right, and that he really had found a good use for propolis, as we were aware that certain beekeepers would be able to supply it in fair quantities.

If our memory serves us rightly, Mr. Frank Benton also met Mr. MacKenzie, and told him he had about 40 pounds of propolis saved up, but he would be glad to have it. Mr. MacKenzie asked him to ship it C. O. D. We have since wondered whether Mr. Benton sent his stock of propolis to him; and if so, whether he received anything in return for it.

MR. J. C. ARMSTRONG, of Marshall Co., Iowa, when renewing his subscription recently, had this to say about some so-called beekeepers:

"I have delayed renewing some time, thinking to get a couple of subscribers to whom I sold bees, but they are not ready. They want to wait until they get their money's worth before they will send any more. I have a man to a man and asked him to take the American Bee Journal and a book on bee-management, which he said, 'No, I will wait till I see what luck I have.' I told him if he had good luck he didn't need a book, but the way to have him was to read up. I saw him occasionally through the summer and he was having good luck. He had gotten two swarms! I have not heard from him this spring; but I suppose he will sing a different song now—no luck. That is the way with them. They will come in at the wrong end of the bee business. If a farmer were to go to work on his farm with no more knowledge of the business than they have of bee-management, and trust to luck, we would think him foolish. Yet they are wise!"

A "MEASLEY" EDITOR is Mr. H. E. Hill, of the American Bee-keeper, if we may take the following paragraph in his May number to refer to himself instead of to a youthful member of his family:

"It is our rare privilege this month to have a case of measles against which to charge any editorial short-comings."

That reminds us of the exceedingly "measly" time we had with the bee disease last year.

We were 21 years of age, and as is well known when this disease takes hold of an adult, he is liable to have a hard time of it. We were attending college at the time, so away from home and mother. We will never know whether those of us who arrived the sick boy began to mend almost at once. Ah, can any one ever forget a mother's love and tender care? God bless all the dear self-sacrificing mothers—and yes, all the boys who are away from home and mother.
City Ordinances Against Bee-Keeping.—We have received newspaper clippings from the Rochester, N. Y., daily papers, announcing that an ordinance relating to the keeping of bees within the city limits was passed there by the common council April 30th, to go into effect May 2d. It provides that no bees can be kept within the city limits without the written permission of lot owners within 100 feet of the hives; such written permission to be filed in the office of the city clerk.

The passage of the ordinance grew out of complaints made by several residents of the 10th Ward to its alderman, against W. R. Taunton, a bee-keeper. We understand that Mr. Taunton is prepared to test the legality of the ordinance, and is backed by the National Bee-Keepers' Association, and also the New York State Association. Personally, we are in favor of having the matter pushed to the fullest test, as we are very confident that no such ordinance is legal anywhere. Of course, there may be certain instances where the keeping of many colonies of bees is not advisable on account of the locality being closely built up with occupied houses, and yet, even in such a place, if the bees were kept on the roof there would likely be no danger whatever. This is the case in several places in Chicago, and so far as we can learn there has been no complaint from the neighbors. Whenever there is trouble it usually grows out of some spite or jealousy on the part of those living near the bee-keeper, and very likely from troubles arising from other sources than the bees.

We understand that in several other cities in this country there are municipal ordinances prohibiting the keeping of bees within the city limits. We do not know whether their legality has yet been tested, or whether the bee-keeper has simply moved outside. We certainly would not encourage the keeping of bees in thickly settled portions of any city, even though no harm would come from it to any one. But there are many portions of every city that are so sparsely settled that there is no reason at all why bees could not be kept, if so desired. Bees in such places are not only a source of pleasure, but often yield profit to their owners. It would hardly be advisable to make a business of bee-keeping in some cities, but in a large one like Chicago, where there are hundreds of acres of vacant property within the limits of the city, it appears to work all right. In some portions of Chicago there are almost whole farms that are not more than an hour's ride and built upon for many years to come. There is no reason why hundreds of colonies of bees should not be kept in such places, especially when there is such an abundance of bloom that is going to waste for the want of bees to gather the nectar.

In view of the many demands upon the National Bee-Keepers' Association for funds to be used in the defense of cases which are constantly coming up for settlement, it behooves every bee-keeper to send in his dollar and become a member. No one knows when he may have trouble of his own, in the settlement of which he will be glad to call upon the Association. We wish that all readers of the American Bee Journal were members of the National Bee-Keepers' Association. Even if any of them should never need its aid, they have the satisfaction of contributing to what has often proved a “Gibraltar of Defense” in the pursuit of bee-keeping. It should never lack for funds to carry on its righteous wars.

Breeding for Good Stock.—The Luxembourg Bee, gives some of the principles that are held by Swiss bee-keepers:

Parents transmit their good qualities with more or less certainty to their progeny. The longer a trait of character is continued from generation to generation, the more certainly it is transmitted. The more alike the parents are in their traits without being nearly related, the more surely are those traits transmitted. Every country has its own conditions, which affect the course of time; affect the character of its animals, so that the natives are the best for that country.

As to the last item, it might be said there is no native race of bees in this country, and the fact that the black bee was first imported into this country by no means settles the question of its superiority, for this country.

Slow Cooling of Wax.—The American Bee-keeper quotes the Progressive Bee-keeper as saying "the color will not settle." Probably both will admit that the dirt settles, and when the dirt settles the color of the dirt settles with the dirt, and the color of the dirt, as well as the dirt itself, is part and parcel of a cake of wax in which the dirt has not settled.

Unpainted Hives are discussed by G. M. Doolittle in the American Bee-keeper. He figures as to the matter of economy. He has hives and covers 20 years old that are still good. If he had kept them painted it would have cost him $1.15 for the 20 years for each hive, while $200 will get that part of the hive new. It is only single-walled hives that he believes should be left unpainted, the advantage being that in unpainted hives the dampness has a chance to dry out. To the objection of Arthur C. Miller that the inside coating of bee-glue prevents evaporation, he replies that "with the freezing of winter and the moisture coming in contact with it, the bright, shining surface of this varnish becomes dull and full of very fine cracks and holes so that moisture and air pass through it."

Honey as a Remedy.—We desire to call particular attention to the article by Dr. Jas. McLean, on another page of this issue, it will repay a careful re-reading and heeding. Bee-keepers and their families ought to be the healthiest people on earth. Undoubtedly they would be very much healthier than they are if they really knew how best to utilize one of their most common home productions—honey. The reading of a few articles like Dr. McLean's would be a great help to all. It should have a wide reading.

Artificial Ripening of Extracted Honey.—W. S. Hart, in the American Bee-keeper, says he gets more honey and a more uniformly high-grade article by extracting it when one-third capped, and ripening it artificially. He built a room adjoining his honey-house, covered it with glass, and put in an evaporator of tin, in which the honey runs slowly from side to side in a thin stream four inches wide a distance of about 110 feet, under the full heat of the Florida summer sun. By drawing off from the bottom of the tank he gets only the heaviest, while the thin honey at the top of the tank is constantly evaporating.

Pictures of Apiaries Wanted.—All have doubtless noticed that during the past year or two, since using a better quality of paper, we have been endeavoring to present to our readers half-tone pictures of apiaries in different parts of the country. Of course, we are after the nicest and best ones, and it may be that there are quite a large number that have not yet been shown, that are far superior to any that have appeared on these pages. At any rate, we would like to receive good, clear photographs of modern, up-to-date bee-yards for the use mentioned. Should any pictures be received that for any reason we could not use, we will return them, if requested to do so.

It may be those who have not already had photographs taken of their apiaries will be led to do so the coming summer, by reason of the above suggestion.
Medicinal and Nourishing Properties of Honey.

BY DR. JAS. M'LEAN.

A PERUSAL of Prof. Cook's able review of Thomas W. Cowan's book, The Honey-Beey, which appeared in the Bee Journal for Dec. 20, 1900, suggested the following remarks on pure honey, etc.

The physiological effects of honey are singular, though mild and passive in their character. Honey occupies a broad line between alimentation and therapeutics, being both food and medicine: therefore it belongs to the class of medicinal remedies that cure indirectly—that is, by putting the vital forces in such a condition as to enable them to overcome diseased action. Mineral water, cod-liver oil, malt, etc., all belong to this class of remedies.

Before speaking of the curative properties of honey we will note its physical properties.

In the first place, where does honey come from? Some assert that it is a secretion of the bees, others that it is a natural substance. Of course it is a natural substance. Each product the laboratory would have furnished us long ago with genuine honey. It must be remembered that the sugar and glucose that bees resort to in flowers and fruits, is nearer honey until it has passed through the stomach and intestines. It is well known that bees do not make honey, it is produced by their saliva, and the other to make it assimilative for the formation of an oil, that is perfect wax.

It is generally supposed that after a bee returns to its hive, it has treated it hurriedly down into a cell, and goes out for another, but this is not the case. When the bee returns, because of fatigue and under the stupifying influence of digestion, it has to abide for a time, both to recover its strength and to assimilate the product of its labors. We have reason to believe that even after the honey is deposited in the cells it has yet to receive the finishing touch of perfection, which in all probability is given by the younger bees of the colony. They live on the honey importations, and as the process of assimilation, digestion, and excess of gastric secretion: when coming to a certain point it creates a regurgitation something akin to vomiting. This is a preparation of bees preparing for the cell, thus completing the process of honey-making.

Another point as to the character of the bee's stomach. As soon as it is unloaded an insatiable sense of hunger and restlessness ensues, which at once forces the old bee to work or be disposed of. It is an insult to the bee to respect the buzz of the hungry bee, and admire the sweet disposition of the one that has just finished a sumptuous repast. Ah, how rare are family jigs when the pantry is ever full! It is Nature's law, all the same.

We go more especially into these details to point out the medical properties of honey. It has two physical elements that make it particularly a medicine, namely: First, an aromatic irritant imparted to it by the stomach of the bee. Second, its ready transformation into fat without those complicated physiological operations necessary to transfer other saccharine elements into this material. These make it at once both a local and a constitutional remedy. Laxative, diuretic, antispetic, resolvent, rubefacient, and a parasiticide. Constitutionally it is nutrient, demulcent, laxative, deoh- struent, alterative, restorative, tonic, expectorant, febrifuge, and antiphlogistic, being a most beneficial, containing poisons proper to the human body. These are manifested under peculiar circumstances.

When we say that honey is both an irritant and a sedative we mean that its first effects may irritate, and be followed with a sedative effect. All stimulants and poisons, whether taken internally or applied externally, act upon the system at first with the most of eye- waters, etc. The solution of honey as an eye-water proves particularly beneficial on account of its antiseptic, absorbent, or resolvent properties. It cures inflammation of the eyes in the way a solution of boracic acid does, that is, mainly by reason of its antiseptic and sedative properties.

The irritant properties of honey are, in a great measure, destroyed by dilution. Therefore, as a topical irritant where we wish to favor resolution by counteraction it is used in a pure state, or in conjunction with more active irritants. It is its irritant or rubefacient effect, joined with its emollient nature, that precipitates local inflammation into suppuration, and, therefore, a suitable remedy for chronic ulcers and boils, which do not answer to any other means. I have known a case precisely similar to one who applies a honey plaster over an inflamed eye in place of the solution. As a rubefacient and absorbent it makes an excellent local application in glandular swelling, and tuberculous inflammation; particularly when joined with iodine, iodoform, or mercury.

On account of the temperature of the body it is difficult to keep pure, undiluted honey on the surface. This can be alleviated to some extent by dipping the eye, as the Canton flannel, and applying them, changing frequently. I speak of it as a parasiticide not in connection with the theory of the pathogenesis of diseases as advocated by Pasteur, Cohn, Koch, Klebs, and others, who have investigated the bacteria, but even those who created general skin diseases, well known to almost every one. Take honey for the destruction of the bacteria, because of its antiseptic, tonic and laxative effects. Its daily use would disarm every dire and malignant disease of its destructive force. Cholera, yellow fever, smallpox, scarlatina, and diphtheria, may run their course as before, but comparatively in such a mild form as to afford but little, if any, suffering for the patient. I speak of it as a suppressant of malignancy in these diseases, and not as a curative agent.

The constitutional effects of honey can not be fully understood and appreciated, except it be studied from its medical properties, as represented above. All scientific solution of a complex mixture, which is worth the time of the reader, I have purposely left in the text to a long and complicated sermon. Every physician will read in it such a multiplicity of applications as would astonish the uninitiated.

As a nutritive and stimulant we speak of it as a food, but in connection with its properties which serve to arrest certain diseases, particularly consumption. The important features of the medical properties of honey lie in the nutrient, antiphlogistic, deoh- struent, expectorant, and resolvent, and the management of consumption, and its allied diseases.

Now, let us go back to a fact that exists in the process of making honey. No honey could be had if it were not for its ready metamorphosis into wax. In the making of wax, as stated. The great object in the treatment of consumption is to arrest waste. Therefore we resort to the use of oils, or remedies that will readily make fat in the system. But the great difficulty in the way is to get the system to accept these remedies and effect their assimilation. Under Liebig's authority we give sugar freely to make fat, but the system often refuses it. This alone gives us a great advantage in giving honey to the patient for food, and for that reason we invert it.

In being assimilated honey is disposed of in three ways. What is not deposited in the cellular tissue as fat is consumed by the liver, and its volatile principle is eliminated by the lungs. This elimination is a matter of the greatest importance. It is a part of all applications and uses of the honey. The most remarkable feature of honey as a sedative is in administration by atomization and inhalation. The spray arising in extracting has been proven to exert a very beneficial effect upon cough and dyspnea, thus revealing its curative tendency.

The most effective and enjoyable way to benefit from the general use of pure honey is to have in every home a ready supply, diluted with, say one pound to a quart of water. Let this be used when a large dose must not be used—from which about one tablespoonsful put into a cupful of warm or cold water and taken at each meal, would benefit one a thousandfold more than the stubborn application of nostrums which dilute the system and seriously disarrange our physical and mental machinery. Let any one who suffers from kidney and bladder trouble try this simple and pleasant substitute for one week, and be as well as, or better than he ever was. Indeed, must mankind be to reject one of Nature's very best disease-preventing remedies, in order to temporarily relieve their perverted appetites.

That we would learn seriously to feel and honestly to say, with the Psalmist of old:—"How manifold are Thy works Lord, God, Almighty, in wisdom Thou hast made them all"—including the divinely inspired honey-manufacturing bee.

Let me close by suggesting a trial of one table- spoonful of pure honey, dissolved in about half a glass of cold water, and one teaspoonful of tincture of myrrh, for the cure of indigestion.

San Francisco Co., Calif.
Prevention of Increase—Other Matters.

BY G. M. DOOLITTLE.

In a letter from a correspondent I find the following: "What is the best way to keep down increase? The colonies which I now have furnish all the honey I may need. I do not want to increase my number of colonies further than I now have. Please answer through the Journal, as I am not familiar with beekeeping.

The surest way is to give plenty of comb-room, and then extract closely till the swarming season is over. Probably not one colony in 50 will offer to cast a swarm treated in this way. In fact, very few colonies will offer to swarm where tiered up for extracted honey, and the extracting not done till the end of the season, providing that empty comb-room is given as fast as needed. But when working for comb honey the case is different, and the bees are almost sure to swarm, no matter how much section-room is given or whether these sections are filled with foundation or not.

I know of some apiarists who keep their apiaries at the original number of colonies, while working for comb honey. They are unifying all the brood and before the honey harvest, making one colony out of two, they preparing for this in advance by keeping each colony shut on only half the combs contained in the hives they use, making the stronger help the weaker till all have the half of their hives filled, in the manner just given, and then the bees will divide by natural swarming to the original number, keeping down all after-swarming. Or you can let them swarm without uniting before the honey harvest and, after the swarming season, is over, then divide the swarm to the original number. This accomplishes the same object as the former, only the colonies are not as strong in numbers for storing, and it gives more months to feed after the honey harvest is over, with less losses in section honey.

Swarming is the bane in comb-honey production, and Dr. C. C. Miller and myself are waiting, and living in hopes, that some bright bee-keeper will yet invent something, or evolve some plan, which will entirely do away with the swarming. This plan is based on the thought that they will work all the "livelong days," and all the days of the season, with the vias manifested by a new swarm, with no such a thought as swarming ever entering their heads. What fun there would be, then, in having a number of out-apiaries, all piling up the comb honey—yes, and home apiaries, also.

DRONES FROM VIRGIN QUEENS.

Another correspondent writes thus: "Please tell us through the columns of the American Bee Journal whether virgin queens ever lay any but drone-eggs? And are the drones from these queens capable of fertilizing other queens?"

To the first question I think it would be perfectly safe to answer no, although one or two cases have been reported but rather little as if these drones, which are only few eggs which matured into workers; but I think this can not be other than a mistake.

The second question is one which has not been settled satisfactorily to all parties. Some claim that such drones are just as good as any, arguing from a scientific standpoint that it must necessarily be that, as the drone is the "son of his mother," he could not be otherwise than as good as a virgin queen from a virgin queen as from the same queen after becoming fertile. On the other hand, some of our most practical bee-keepers claim that such drones are not capable of fertilizing queens, and give instances where plenty of such drones were flying but no queens would get to laying because the drones were flying when they should fly to, when they would become fertile and make good mothers.

I have had very little personal experience going to prove the correctness of either, but have always supposed drones from a virgin queen, when reared in drone-comb, were as good as any. Such drones, when reared in worker-comb, may be virile, and, even were they not so, I would not expect any queen to prove first-class which had mated with a drone reared in a worker-cell.

Can you tell us anything about this line? A practical article by some one having experience in these matters would be read with interest by thousands of apiarists.

"OUTGO MUST ALWAYS BE LESS THAN INCOME."

This is what Prof. Cook tells us if necessary if happiness is to result. (See page 248.) And I agree with him exactly as applied to successful business, or to "successful" health. But when he intimates that the "balance of trade" between this and other countries is "very cheering," because our exports exceed our imports, I can not harmonize his logic; for this, to our nation, is like Macawber's "Annual income.
Experiences With Swarming, Hive-Making, Etc.

BY J. B. ALEXANDER

I HAVE been keeping bees for three years. My text book is "A B.C. of Bee-Culture." I take two bee-papers, which cost me about one dollar, and turn over the pages of them I like them very much, because I think they are published by good men—men that try to do the right thing.

Last spring I had a colony of bees to swarm; I caught and caged the queen, and let the bees return, as I did not want to increase. One evening I looked through the brood-chamber to cut out the queen-cells, and the first cell I found the queen had just hatched—I saw her on the frame that contained the vacant queen-cells. I cut all the queen-cells that I could, as I did not want to leave one. I let the newly hatched queen stay in the hive. I noticed there were eggs in the combs at the time. In six days from the prime swarm they swarmed out again. Clustering for half an hour, then returned to the hive. I looked through the hive again and found one or two of the combs, to see if I had left another queen-cell. I found nothing but the cell that had first hatched, and one unassembled queen-cell with a larva in it. I cut this out and they did not try to swarm any more.

My next experience with the peculiarities of bees was in dequeening a colony of five-banded bees (these being the only five-banded bees in this portion of country). I noticed in the course of half an hour a great quantity of dead bees in front of the hive. I watched them for quite a while to see if robbing was the trouble; there was no robbing at all, for the bees all had the same number of bands, so I was sure they were having war among themselves. I opened the hive, and to my great astonishment it appeared to me that every bee in the hive was in a state of war with one of its mates. I swept the dead bees from the bottom-board, which I am satisfied would have filled a quart measure. I cleared the hive quickly, and smoked them with tobacco-smoke at the entrance. In five minutes they were perfectly peaceable.

Now some one will say that it was caused by robbing, but everything went to prove that there was no robbing going on.

I make my hives 16 inches long inside measure, and 12½ wide inside. I cut the frame-rabbets 3⁄8 of an inch deep, and 3⁄4 inch wide, and cut a piece of tin 12½×2½ inches, and double it so it is 1 inch wide, then make the other frames in the round edge (caused by doubling) of this piece of tin. Commencing 13-16 of an inch from one end, I file the notches 1½ inches apart. Then I nail the tin in the hive so that it cannot slip, and I have an extra inch in width. I am not afraid of my bars slanting, and if I do not believe the measurements are without value. It seems a pretty clear case that with long enough tongues there ought to be no difficulty about getting the red clover. If I could get all the red clover honey going on to waste within the reach of my bees, it seems to me I should hardly consider it either a sad or a fallacy. The fact that the midget destroy's Mr. Doolittle's chances does not make red clover honey any less desirable to me. We
are not all "migded." Thousands upon thousands of bee-keepers are located where red clover is all right except the depth of the flower-tubes.

Without knowing anything definitely about it, I am of the opinion that $200 would be a low estimate of the gain it would be to me annually if I could have all the red clover honey within easy reach of my bees. At any rate, I would be willing to give $25 or even $100, for a queen accompanied by a guarantee that I should have all of said red clover honey, and high $1 and $2 to the keeper. It is such a scoundrel that he would stretch the tongues in so as to palm off on me a $10 queen for a $25 one.

Although Mr. Doottle may have no red clover, he might be willing I should have some bees to harvest the hundred thousands of others. McHenry Co., Ill.

Small Neglects Affecting Apiarist Profits. Read at the last Convention of the Ontario Bee-Keepers’ Association

H. W. Z. HUTCHINSON.

"For want of a nail the shoe was lost; for want of a shoe the horse was lost; for want of a horse the rider was lost; being overtaken by the enemy and slain; and for want of a horseshoe nail a kingdom is lost.

Most emphatically is bee-keeping a business of details. Of course, there are certain broad principles that must be observed before success can even be hoped for. The apairy must be located where there are honey-producing plants, and there must be plenty of bees to gather the nectar. The bee-keeper must understand his locality, know when to expect the harvest, and have everything in readiness for it. If in a Northern climate, the bees must be protected from the cold in some kind of packing or by putting them into the cellar. If comb honey is to be produced, some system must be adopted that will keep the working force together instead of having it divided up into two or three colonies. But after a man has mastered all of the basic principles of bee-keeping—yes, after he has become conversant with the details—he may lose a large share of his profits simply from out-and-out neglect.

The bees are in the cellar. He does not go near them. He has made a perfect wintering place for the colony low and, if so, it might be possible to add to the protection afforded by the walls. Boards might be set up around the walls, held in place by strips of wood tacked to the sides of the house, and the space filled in with sawdust. This little colony, secure in its wintering quarters, may come through the winter in poor condition. The bees are in the cellar under the home of the bee-keeper he might employ artificial heat at those times when it is necessary to have a large oil-stove having a hood over it, connected by means of a pipe with the stovepipe in the room above, will answer every purpose. A cellar may become infested with rats or mice that will gnaw comb and do much damage if not gotten rid of. Equal parts of flour, sugar and arsenic placed in dishes in the cellar, will make quick work with the rodents. Mice will play sad havoc with colonies left out from doors if the entrances are neglected. The bee-keeper should make a wintering, he should not neglect them. A perfect wintering of the apiary lays the foundation for a successful season.

After the bees are placed upon the summer-stands don’t neglect them. As soon as the conditions are favorable, look after the wintering bees. Here and there will be a weak one. United, such colonies may prove as good as there are in the apiary. Neglected, they will be of little value—the queenless ones will certainly perish, perhaps because a prey to robbers, thus stirring up bad blood in the apiary at the time of the year when all should be peace and happiness. Some colonies will be found with a great abundance of stores, others on the verge of starvation. Neglect here means the loss of all colonies that are short of stores.

As the harvest comes on, don’t neglect to have the hives, sections, frames, etc., all in readiness. Some of you may be ready to shout, “Chestnuts!” Well, if only those who have never been caught, I think none of us will need to cover up our cars. Nothing will more quickly change the mood, and disposition, and intention of a colony than the neglect of its queen. It is, I think, simply, than the neglect to furnish it surplus room when it is needed. The disposition to store honey is laid aside for that of swarming. A colony with the swarming fever will do little work until that fever is abated. If a colony first swarms for a large portion of the hive will be kept, it will often continue on in this way the entire season with no thoughts of swarming. And, speaking of swarming, reminds me that the neglect to clip off just one little eighth part of a prime hive, the supposed losses from the bee-keeper striking a dejected attitude, as he gazes sorrowfully in the tree tops where he sees, appearing, as little specks in the sky, the last, some straggling members of the rear of a prime hive, that has just swarmed. If perhaps 50, perhaps 75, pounds of honey for its owner had he not neglected to clip off that little one-eighth of an inch.

When it comes to the extracting of honey there is on point that I wish to mention, although it may be more a mistake than a case of neglect; it is that of extracting the honey before it is ripe. Of course, it is possible to evaporate artificially thin honey, but with this evaporation goes a portion of the fine aroma. Not only this, but the evaporation of honey does not ripen it. The bees in their hard work has taken from the nectar a certain amount of water and sugar. They change the raw nectar into ripened honey. If we take it away from them before this change is completed, it lacks that much of perfect ripeness. It lacks the "tang" that tickles our palate. Thin, unripe, watery honey is not a thing to be desired. It is raw nectar, and not much disturbed. It is full of acids and disgusts and disappoints everyone one who has anything to do with it. Nothing has done more to destroy the market for honey than the placing upon it of unripe honey.

Little neglects in preparing the honey for market are very expensive. The neglect to scrape the propolis from the sections, the neglect to use non-drip cases, the neglect to put the cases into a larger case or crate when small shipments are made, may mean the loss of two or three cents on each pound. (Sectional cases are to be used, with roofs and bottoms put on one case and dabbing the one below it, coal dust and cinders rubbed upon the dabbed cases, greatly lower the price and retard sales. Before the days of no drip cases and outside crates I went so far as to wrap a paper around each case before shipment, that the cases might be clean when they reached their destination.

Men who make exhibits at fairs often lose premiums that they might have captured had they not neglected to label their packages tastefully. It is a little thing, but it adds to the finishing touch.

Then there are little things, like, “Where do you keep your smoker and fuel?” The neglect to provide a proper place for them may mean a costly fire. I once kept my smoker and fuel in the same storehouse with the bees, and was charged $50 for a fire that started just before I removed the cover, the flames burst out. Suppose the boiler had been a wooden box kept in a building, and the fire had not been discovered while still confined to the box? I now keep my smoker and fuel in a large box, with a hinged cover, out in the yard.

The matter of saving wax ought not to be neglected. It is a good deal like saving paper rags—just about as easy to save the odds and ends as to throw them away. A solar wax-extractor is a nice thing for this purpose. Keep it out in the yard and the bees will carry it to the comb toss it into the extractor. One year when I did a large job of transferring I threw all the odds and ends into a barrel, and pounded them down hard with the end of a large stick. The bees got down on it, and before I was through until that barrel two-thirds full of pounded-down comb was one mass of webs and wriggling worms.

But why multiply examples? We all know that the profits of an apiary can be entirely wasted or destroyed by such little neglects. Nevertheless, in some places, in some cases it is simply a combination of indolence, procrastination, and a sort of belief that things will come out all right of themselves. Then there is the neglect that comes from having to do so many things, and a certain amount of business that you can only half attend to, that something must be neglected, two courses are open: hire some one to help you, or else dispose of part of your business. There is more pleasure and more profit in a small business well managed, than in a large business that must be neglected. Some men are so constituted that they can not employ help to advantage. They have done all of their

May 23, 1901.
work so long that they feel no one else can do it properly. It would put them all inidgets to see some one else cleaning their sections, or uncapping combs for the extractor. Other men have learned that it is much more profitable for them to quilt, and plan the work, leaving the carrying out of the details to competent help. You know yourself or ought to, so choose the course to which you are adapted, but don’t keep on conducting your business in such a manner that you are compelled to neglect it. Be thorough, up-to-date, program, and expand, and don’t lose half your profits as the result of little neglects.

Questions and Answers.

CONDUCTED BY
DR. C. G. MILLER, Marengo, Ill.
(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Enron.)

Queen Laying Several Eggs in a Cell.

What is the cause of a queen laying from one to four eggs in a cell? It is a weak colony, with a hive full of honey, and some chilled brood. It is not a laying worker that is doing the laying, but a fine, large queen.

Answer.—The colony though small is lively and ambitious, and the queen is probably fed as much as she would be in a much larger colony. The eggs must be laid somewhere, and as the space that is warm enough for egg-laying is too limited there is nothing for her to do but to use the same cells over again. As the colony becomes stronger you will find that she lays only one egg in a cell.

The Nail-Spaced Frame Preferred.

I have had more of the Hoffman frames than I want, and as I have sold all my bees and fixtures, and wish to start this summer, I wish to know first if the Danzenbaker is just as bad to manage for the reason of propolis, and are the general features as good as the nail-spaced Langstroth standard?

Answer.—The Danzenbaker frames are closed-end frames in full, and the Hoffmans partly closed, so there is more surface in contact to invite propolis in the former than in the latter. After giving a pretty thorough trial to both, and all to other kinds, and nothing so satisfactory as the Miller frame already described in these columns. I commenced using them on a somewhat small scale, feeling a little afraid that continued use would develop some objection not suspected in advance, but the more I use them the better I like them, and have perhaps 2,000 of them now in use.

Keeping Down Increase.

1. I have five colonies and do not wish to increase. The swarming-fever struck them a week ago and has not stopped yet. My neighbor told me how he does but I do not like his plan, viz: Take a soda-cracker box five inches long, about 8 x 10 inches, and about 8 inches deep, and put in the cluster into it, and place a bottom-board over it. Take it to a new stand, invert it, and as an entrance has been previously made we have a new but small hive which my neighbor says will be filled solid.

Yesterday one of these swarms came out of the box three times, clustering on the same post each time. The third time I gave them a new box with two pieces of foundation stuck to the top 1/2 inches wide, and they seem to stay all right. The neighbor says early in the spring he gives these cracker-box bees back to the original colony, and has a fine colony to begin the harvest, and then repeats with the same boxes next year. This is my first experience with bees, so I don’t like to fall too heavily on my instructor, but it does seem to me that the number of bees which I have put into these small boxes will be terribly crowded.

What was the reason of those bees coming out three times? As I am a half-invalid, through eight years of throat affection, it nearly exhausted me, going to and fro.

2. Now, to-day, another swarm came out of the hive that swarmed day before yesterday, at which time we requeened the colony, killing the old queen, of course. The bees are maintaining the new queen, just hatched yesterday, How can you account for to-day’s swarming with such a new queen? or do you think the new queen never materialized? Would they swarm under those conditions? We cut off all the rest of the queen-cells in that hive.

California.

Answer.—1. I’m a little inclined to think I’d pay off that instructor and hire a new one. To put a strong swarm into a box containing no more than 640 cubic inches—less than 10 quarters—in these days of expansion is pretty severe contraction. The combs built are not in movable frames, hence not the most desirable. The probability is that the bees were too crowded and warm, and swarmed out on that account. Shaking well and raising up the box inch from the bottom-board would help. If your object is to keep down increase, perhaps this plan might suit you better: When the colony swarms, kill the old queen and return the swarm. If your queen is clipped all you have to do will be to pick her up and kill her, and the swarm will return of its own accord. A week later cut out all queen-cells but one, and the work is done. There will be no more swarming for that colony till another year.

2. If I understand you, when the colony swarmed, you killed the old queen and returned the swarm to the queen-cells and giving them another cell, then two days later the colony swarmed again. It is not easy to say just why they swarmed the last time, but there are several possibilities in the case. One is that a queen may have entered from another hive. Another is that the cell you gave may have been well advanced, the queen having been held in some time by the bees so that two days after you gave the cell she was old enough to make her wedding-flight, and the bees swarmed out with her, and when she made this flight, which is not a very unusual occurrence.

A Question on Bee-Management.

White honey is produced in this locality early in the spring, and the nights here on the coast are cool so the bees fell to breed up to good working force in time to get the first flow. How will it do to form a nucleus say in June, and in the fall place it on the old colony with an excluder between; then when both are well filled with brood take out the excluder and kill one of the queens in the spring? Florida.

Answer.—I don’t know. I doubt if it would work to your satisfaction. The object would be to throw, in the spring, the force of the two queens together. I suspect you might do that better by having the two colonies side by side in the same hive. In this way you have a third division-board between them with no communication between the two sides. Then in the spring they could be thrown together. But it would be worth while to try very hard to have colonies so strong in the fall that there would be little need for feeding in the spring. Then the weakest could be united with the medium ones.

Managing Bees in a “Beer-Keg Hive.”

I have a very strong colony in a “beer-keg” nearly filled with honey. I propose to add one or two 8-frame hives underneath until the white clover flow begins, then change them to the top of the keg with a queen-excluder between, with the queen below. Will the bees carry the honey, or do you think they will form a separate colony and live in the brood alone until hatched, then put on sections. My idea is to get the honey now in the beer-keg in sections, and let the bees winter in the keg. Indiana.

Answer.—I’m afraid that thing is so mixed up that the bees will hardly know what is expected of them, especially if there is any of the beer left in the very bottom to stupefy their little brains! Evidently, your idea is that the keg will be so filled with honey by the time of clover that the bees will have worked down so as to fill one if not two stories of combs in frame hives.

That may be so, and it may be that they won’t come up to your expectations and will have very little done in the hive under the keg. Suppose, however, it works to your
satisfaction, and your two hives are fairly filled, it will be mostly brood in them. When you put them above the excluder, the queen you will put below in the key that is now solled with honey (for you may count that it will be filled with honey if the bees have been driven down to occupy the two hives.) At this time the bees will turn all their energies toward storing, and the likelihood is that while the bees will do some emptying to give the queen a chance, the chance will not be a very large one, especially as the queen up to this time has had unlimited room to spread herself and by this time has become somewhat exhausted with laying. The brood will be all the time having a home to turn and as your two hives are solid with honey there will not be such a great deal of time left for the bees to work in sections, for they will not do much in sections so long as room is left in the hive-bodies. I don't quite see what you expect to gain by getting your key filled with brood and emptying the top. If you want the bees to winter in the key, why not leave them their brood-nest there all the time, putting sections on the key? One good plan would be to leave them in the key till they swarm, then hive the swarm in a hive and throw the field-force all into the swarm, leaving the key to strengthen up for the winter.

**Transferring Bees on Crisscross Combs.**

I bought two colonies of bees and they are in small hives, one is a seven-frame and the other is an eight. The frames had no foundation, and the comb is built in every direction. Is it advisable to transfer them to another hive? If so, when is the best time? and will that prevent them from swarming?  

**ANoNTARO.**

**Answer.**—If you don't expect to handle the frames at any time, then it is not worth while to transfer, and it will be better to leave the bees as they are. If, however, you want to handle the frames at any time, then by all means they should be transferred. You can turn the hive upside down if the bottom can be taken off; cut down a long knife or saw so as to loosen entirely the combs from the side of the hive, then when you lift the hive-body off the frames it will be easy to get at the combs.

It is a good time to transfer, and it need not prevent swarming. Nowadays the tendency is growing toward waiting till the bees swarming, and transferring 21 days after swarming, when there will be no brood in the hive except a little sealed drone-brood.

**Curing Pickled Brood.**

What can I do to cure pickled brood?  

**WEST VIRGINIA.**

**Answer.**—In an able article in this journal five years ago, Dr. Wm. H. Howard wrote: I have recommended, with successful results, placing the bees on full sheets of foundation, confining them for three days (giving them plenty of water) before removing all of the insected material, that none of it might be deposited in the new combs to be covered with new pollen or honey.

---

**Convention Proceedings.**

**Report of the Chicago Bee-Keepers' Convention.**

The Chicago Bee-Keepers' Association held its 23rd annual meeting at the Briggs House, Chicago, April 4, 1901. There were 35 in attendance, and several new members were secured.

The secretary had some correspondence with Mr. C. P. Dadant, about being present, and had given up hope he would come. But about 10 a.m. on April 4th a telegram was received by Pres. George W. York, saying that Mr. Dadant would arrive at the Union depot at 2:30 p.m. Of course this was an agreeable surprise, but we had known it a week earlier we might have filled the clubroom of the Briggs House at our meeting.

I would like to say right here that those 250 bee-kepers, within reach of Chicago, are standing very much in their own light in not attending our semi-annual meetings. We have really good times and exchange many valuable ideas.

Of course Mr. Dadant's presence made a good convention, above from any other annual meeting. He held up to us about Paris and the great Exposition: about the French people; about the little old man who had carried him in his arms when he was a very small child; and of course he was ready to answer any and all questions asked of him by the A B C class of bee-keepers as well as the X Y Z class—and the questions were numerous.

Prof. E. N. Eaton, State Analyst of the Pure Food Commission, was present, and addressed the meeting, and also forced his annual dinner tackle. He told us about Paris and the great Exposition: about the French people; about the little old man who had carried him in his arms when he was a very small child; and of course he was ready to answer any and all questions asked of him by the A B C class of bee-keepers as well as the X Y Z class—and the questions were numerous.

**Report of the Texas Bee-Keepers' Convention.**

The Texas State Bee-Keepers' Association held its 23rd annual session at Greenville, April 3 and 4, 1900. President W. R. Graham being sick, was unable to preside, and vice-president A. M. Tuttle being absent the meeting was called to order by the secretary, J. N. Hunter, who acted as chairman. He made a few preliminary remarks, reviewing the history of the Association from its organization to the present time. Prayer was offered by the Rev. W. R. Lowery.

Messrs. Hagood, Osborn and Scott were appointed a committee on program for discussion.

About 40 bee-keepers were present during the two days' session, representing some 2000 colonies of bees, the average yield of which last season being over 100. Secretary Hunter explained his method of transferring bees. He prefers the hybrid bees and uses full sheets of comb foundation.

J. R. Scott explained his method of transferring and feeding. He gives the black bees due credit for gathering honey from cotton.

Peter Lambert and some others are satisfied that bees gather honey from corn-tassels.

Mr. Tuttle has discovered that ants rob cotton-bloom of its honey on the sandy lands. He thinks that is the reason why bees gather more honey from black-land cotton-bloom.

Messrs. Graham, Hagood and Lowery were elected to represent the Association at the bee-keepers' meeting to be held at College Station, Tex., next July.

W. R. Graham was re-elected president; J. M. Hagood and W. R. Lowery, vice-presidents; and J. N. Hunter, of Renner, secretary.

After its usual vote of thanks for hospitality and entertainment the convention adjourned to meet in Greenville the first Wednesday in April, 1902.  

**J. N. HUNTER, Sec.**

---

**Why Not Help a Little**—both your neighbor bee-keepers and the old American Bee Journal—by giving to the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

**The Chicago Convention Picture** is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for $1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.
EASTERN FROM THE SOUTH.

As Dr. Miller, on page 219, queens may arrive from the South when it's not altogether safe to introduce them. General requeening with young queens is often urged; and I think that this practice should be discontinued. The queen is seldom danger to the hive, and usually a word to the wise is sufficient: but if it is a printed word he may not see it—so I think a little more "racket" on the point would be well. Doubtless the Southern breeders will be willing to assist in the racket—to moderate the push for extra-early queens.

QUEEN KIND OF CHAFF HIVE.

Mr. Ochsenner, of the Wisconsinans, seems to have a queen kind of chaff hive. Pumps down heat so that melting occurs, and frames and colony have to be put into single-walled hives to stand the sun. That's not the kind of chaff hive which prevails elsewhere out west?

WEAK COLONIES IN THE SPRING.

Why does a weak colony in spring survive when left alone, but dwindle out and perish when united with several others like itself? I have made an off-hand guess that although not fighting when united they felt more like fighting than they did like going to work—disgruntled at the mixed company. Am quite willing, page 246. I am fairly disposed to give Mr. Doolittle's more thoughtful solution—too much activity, too much brood started, and nearly all the bees dying off, in regular course of nature, before any young bees emerge. Page 291.

SWARMS CLUSTERING WITH CLIPPED QUEENS.

Prof. Cook gives us a good, hearty stake to tie to on page 250. Has seen hundreds of swarms issue whose clipped queens could not go with them; and only a few in the lost fail to cluster (either wholly or in part) before going back.

HYMYOPTERA—"MARRIED WINGS."

I'm a little disgruntled at Prof. Cook's Greek on page 233, where he translates Hymyoptera (the order to which our bees belong) "membranous wings." Don't wish to deny that the word will bear that translation, as meanings of words go; but what in hymenopterous is the matter now with the straight-out translation "married wings?" This is an allusion to the fact that each wing is bound to its neighbor on the same side both fore and hind, thus marrying the one to the other. It's marriage become a failure even among the wings of bees?

DISCIPLE OF IZAAK WALTON.

And, so according to page 238, its fishing you're going to set me at next. On the familiar principle, that a man can go on the most freely on a subject when he draws it fresh out of his own head (unpestered by facts and natural laws and experiences and things), I ought to be able to write a two-volume work on fishing. Tell Mr. Blunk it's 57 years this spring since I cast my first hook in the waters for fish. But I didn't catch any. Neither did I on any subsequent occasion. Never in my life caught even a minnow the size of your little finger. So in this sub, for the volumes, if you want 'em.

WHY BEES BUILD A CERTAIN KIND OF COMB.

It is something of a mystery—and a mystery that we should care much about—why a bee should build worker-comb when they build it, and drone-comb when they build that. One rather feels that Mr. C. P. Radant is walking on the water instead of touching bottom in that part of page 207. The facts are as he states them; but the reasons—well, we must ask the respect to the reasons, too, till some one can offer better ones. In fact, if we assume that (for some unknown reason) a bee prefers to build drone size, except when the queen (by some unknown means) causes them to build worker size, that will pretty nearly cover the ground, perhance. If the queen caused them to do it we would not need to assume that she intelligently caused it, nor yet that they fully understood the effect of their own work. But even then we might have trouble to answer when asked: Why then do they build any worker-comb in an upper tier of sections?
and it is better still that the most of our beekeepers will prize it most because of this very fact. Any one who knows Mr. Hatch and his kindly thoughtfulness, can readily understand how Mr. Wallenmeyer, and Mr. Miller might say that it was a prize that was of no worth to the rest of the household. Some may wonder that I speak of wax as “dirt.” A weed is a plant out of place. Dirt is matter out of place. Purslane (pusley) on the common or by the roadside is no weed. In the garden or field, it is a pestiferous one. This is the same as can be said of the dirt that is neither dirt nor dirty. Inside the kitchen it is usually both.

THOUGHTFULNESS FOR OTHERS.

The above suggests what I believe will prove the best ornament in the household—thoughtfulness to help and to give pleasure to all its members. In many a home the thoughtful habit becomes almost instinctive. If any member of the household has the habit of rising earlier than the others, he or she will do his or her best to keep the others from sleeping. Thrus at this earlier hour he will find himself tiptoeing about the house, which he would not think of doing later in the day. The door will be carefully shut and the lights will be turned off to keep the others from sleeping. This caution may become so instinctive that it will even last through the day, as I have known the father frequently to find himself tiptoeing even in the daytime as he approached the bedrooms.

It has been my privilege in my past life frequently to pass, often quite late in the evening, by the house of an old gentleman whose habit it was to retire early, with a person who thoughtfully closed the doors and shut off the heat, to make an inspiration to me. This one, as we approached the house, the old gentleman, would always lower the voice or cut short the laugh which might awaken the sleeping one. This never-failing thoughtfulness did more to beset thoughtfulness in old hands than perhaps a dozen requests to act in like manner.

We often hear people lamenting that there is so little reverence at the present time among us. I believe this implies an error. I believe there is more genuine reverence among us today than ever before. The greatest of these examples is my father. I am always displeased at the complaint. Want of reverence is so hateful a thing that even fear that it is a growing evil may well cause unrest and regret. We must remember in this day of telephone and rapid transit, we have traveled over the whole world, each day, and our fuller knowledge often misleads us in regard to the condition of society.

I repeat, I believe the world never has so much of reverence as it has today. It is certainly true that nothing so increases the reverent spirit among us as thoughtfulness. There is no place where thoughtfulness pays such large interest as in the home. I remember once a girl asked me for a sure test in selecting the right person for a life companion. I believe there is no one person on this earth, not even the thoughtful father, mother, yea of all the members of the home circle—always intent to add to the pleasures of others, and equally careful never to wound or make uncomfortable—has been requested to stop playing the part of God.

Unselfishness must always be at the root of thoughtfulness. Unselfishness is a Godlike attribute. If we can only teach our children from the very cradle always to be thoughtful of the happiness of others, and always to be on the lookout for opportunities to make the home more a place of comfort and good feeling, we surely have done our part toward the building of an unselfish and a reverent character.

In the years when I lived at the Michigan Agricultural Colleage, there was a Sunday morning habit of my wife and family to go to the church in Lansing, three and a half miles distant. In going, we almost always passed one of the business men of the city going with his family to the same church, a little boy who was~his brother. In the early years, up to the teens, they were always hand in hand, and the evident attention of the brother, and watchfulness for the comfort of his little companion were often the subject of remark in our family as we passed the church. This boy and his little brother, unconscious of it, were helping us to become better people. As the young people grew into their teens, the same attention on the part of the brother was always in evidence. Walking on the windward side of the church, while the others passed first into the church, were all signs of a lovely character which from the first challenged our admiration. Mrs. Cook often remarked, “There is the making of a model housekeeper.” True, if it is a true judgment, it was not accidental. There are a few things which we in the home circles should never forget—love of truth, self-control, and this habit of thoughtfulness; it is a trinity of blessed qualities, and means so much not only to the life of the individual but to the comfort and blessedness of the home, that we should commence at the very cradle to speak their importance to the loved ones whose characters we are to fashion.

NEATNESS AND ORDER—A FOURTH VIRTUE.

It has been my happy fortune to visit very many of the beekeeping homes of our country. It is always a rare treat to visit those who are interested in the same things that occur in the audience-room, one of the best pleasures comes from the study of others, their habit and manner, so in these visits it is not the least pleasure that comes to us to study the special fitness of our hosts.

I remember my first visit to Mr. T. F. Bingham’s apiary. I had often met Mr. Bingham in conventions, and was always pleased at his perfect attire and every courtesy, and so was prepared to find his shop and apiary the perfection of order and neatness.

I have one other example that is quite-as striking, and no one will wonder that it is suggested. It was that of Mr. Hetherington, who has been so long associated with Mr. Bingham in the matter of the honey-knife. Many of my readers will remember how pleasant it was to look upon Mr. Hetherington at our conventions. One had to see him but a moment to know that system and neatness were ever in attendance at the Hetherington home. It was but to think of all hundreds of similar cases. Mr. Hilton and Mr. Taylor were other examples. These men never came to a convention without a necktie, or with spots on their clothing. These gentlemen had apilaries that were justly their pride. It always gives me a thrill to see the neatness that was so much in evidence, and they could put their hand on every utensil even in the dark. Such system implies neatness, for nothing is out of place, and so from our description above, there can be no dirt.

I have often wished that it might have been my good fortune to have visited the apiaries of Captain Hetherington, of New York State. I have no doubt he has the same habit of order and neatness that I admired in his brother. We have all wondered that one man could manage so large a business as is carried on by Captain Hetherington, and win success all along the line. Does not the word system give quick explanation?

We have given above a trinity of qualities so excellent that we should commence at the cradle to develop them in the lives of our children. Would it not be well to make it a quartet, and add the virtue of neatness and order? This can be done by teaching the children always to hang their clothes neatly on a chair as he retires to keep his playthings in perfect order; and his room, if we can afford him one, always neat and orderly. Put a premium upon such habits, and if we cannot, let him be urged to keep his playthings in order and his room neat and orderly. We can put a premium upon such habits, and if we cannot, let him be urged to keep his playthings in order and his room neat and orderly. We can put a premium upon such habits, and if we cannot, let him be urged to keep his playthings in order and his room neat and orderly. We can put a premium upon such habits, and if we cannot, let him be urged to keep his playthings in order and his room neat and orderly. We can put a premium upon such habits, and if we cannot, let him be urged to keep his playthings in order and his room neat and orderly.
A Young Bee-Keeper's Report.

My grandfather was a bee-keeper, and he gave a colony of bees to the oldest grandchild in each of his children's families, and I, being the oldest in our family, got one of them. We now have 12 colonies working nicely on fruit-blossoms. We make our living mostly by selling section honey and poultry, and would like to have 30 colonies to help us get our own honey. I help manna the hive and bees and take off the honey; my father is not able to help any, so I've taught children all help a little. I go going 3 sacks of bees to work about an hour 3 times a week, and when I do that I will have to help my father. I am not afraid of them as a great many people are. I am a girl of 13 summers, and not a very big one at that.

GERTHIE HENRY.
Page Co., Iowa, May 3.

Bees in Fair Condition.

At this time our bees are in fair condition, and we hope for a good crop of honey. All our colonies wintered well.

Miss. D. W. WOODMANSEE.
Arapahoe Co., Colo., May 9.

From a Young Bee-Keeper.

I am 18 years of age, and have been trying to keep bees for the last four years. I got up to 75 colonies, and about one third dry years I lost 60 of them, so you can see we have hard times as well as anybody else.

Los Angeles Co., Calif., May 1.

An Industrious Lady Bee-Keeper.

We think we will have a good honey crop this year. Our bees are storing in the supers now, and are swarming right along. We have 48 colonies. You ought to have been here last week and the week before, I, myself, put up 75 hives, driving every mail, and then painted them, and caught all swarms that came out. My husband is a railroad conductor, and can't be here to do any work, so I have to hire anything done on the place. I was out putting up hives one evening when a lady came in. She said: "Oh, the bees are to have it that way? You have got a gold watch." I said: "I have silk dresses in the wardrobe, but I like to work. My husband tries to keep me from it, but he can't.

I think if more women would work there would not be so many bankrupt men. Of all things, a lady woman is the worst. The bees teach us such good lessons. For 20 years my health had been so bad every spring that if I didn't use a tonic I was bedridden; but the little bee is the best tonic. For five years we have kept them, and I am out almost all day with them. I do not need a drop of medicine now. I tell many women if they would keep off the streets and go to bed before the stings of a few colonies of bees, watch them, and read bee-books instead of novels, they would be better wives and mothers. They say: "Oh, the bees will sting." Well, if they do it will not last long. I would rather be stung trying to make something than to be stung for the want of something.

MRS. J. TUCKER.

Prospect Good—Bees Stinging Chickens.

We are expecting a good honey crop this year. Bees wintered well, seen strong, and are building up fast at present. Fruit is a little past its best now. Vine maple will be the next to bloom after apple; it makes a very nice honey, and has a flavor like maple syrup.

I have about 30 colonies, mostly hybrids, though some of them are blacks. Last year

PAN-AMERICAN OPENING.
The Nickel Plate Road will sell excursion tickets from Chicago to Buffalo at $13.00 for the round-trip on each Tuesday in May (the 7th, 14th, 21st and 28th), with limit of 5 days, normally returning good on any train to and including midnight train from Buffalo on Saturday following Tuesday tickets are sold. They will be good going on all trains on date sold.

Daily train from Chicago at 10:30 a.m., arrives Buffalo 2:05 following morning; daily train from Chicago at 2:30 p.m., arrives at Buffalo 6:45 next morning; daily train from Chicago at 10:30 a.m., arrives Buffalo 4:45 next afternoon.

All trains carry through vestibuled sleeping-cars. Individual Club Meals, ranging in price from 35 cents to $1.00, and no meal in excess of the latter figure, are served in dining-cars.

For sleeping-car reservations and all other information, call Chicago City Ticket Office, 111 Adams St., or write John Y. Calahan, General Agent, 111 Adams St., Chicago, phone Central 2027. Chicago Depot: Van Buren St. and Pacific Ave., on the Elevated Loop.

No. 7—20A2t
A Home in Colorado FOR

I have a fine Fruit-Ranch of 14 acres here at Fruita, all set to fine fruit, principally winter pears, prunes, pears, peaches, peaches, plums, cherries, apricots, plums, and about 700 grapes; 100 colonies of bees, mostly Italians, and 1000 bee boxes. I will sell with the place. The orchard is in fine bearing, being about 10 years old, and is clean and handsome, and of the black bee, one of the best 7-room ones, nearly new, with bath and water: a good new barn for two horses and two cows, and a brick hen-house and two good cellars, good lawns, and a very fine spruce, and also a paid-up water-right with the place, with an abundance of water at all times for irrigation. I am desirous of being near the town in my occupation, and will sell the place at a bargain. With the proper party the yield from the place this year will be about $2,000. It joins up to within 20 rods of the town site of Fruita, where we have one of the best high schools in the state, employing 7 teachers. It is only one mile to the depot, churches, school and post-office, and has telephone connections with all parts of the state. This is a good, healthy climate, and good society.

Address for terms and further particulars, J. C. CARNAHAN, Box 64, FRUITA, MESA CO., COLO. Please mention Bee Journal when writing.

Red Clover Queens

LONG-TONGUED BEES ARE DEMAND ed NOW.

O NE Untested Italian Queen FREE as a Premium for sending us TWO new subscribers to the American Bee Journal for one year (with $2; or, one Tested Queen free as a premium for sending us FOUR new subscribers with $4.00).

We have arranged with one of the oldest and best queen-breeder (having many years' experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The queen if you will use a direct from Italy, having imported him herself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They store red clover honey last season.

Orders for these "queens" will be filled in rotation—first come, first served—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be clipt, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO.

Please Mention the Bee Journal when writing Advertisers.......

When it becomes cool the bees will shrink away from the space between the top-bars, and cluster on the combs above and below. So you need not have a colony full of bees in two stories. Now put between these two stories another story filled with dummies and Queens that will attract 10 percent more bees to "man*" the combs than it did before! I suspect 5 percent would be plenty.

Even if the loss were all be supers—1,000 to 2,000 cells, or 3-3 of the brood-chamber—I should still want the top-bar 3/8 deep. At one time I used, entirely, white, red, yellow, and mixed, eight sections; and when I put on a super I put in the middle of it a brood-comb from below. The bees very promptly accepted that super, but it did not answer to leave the brood-comb there very long. If I left it long enough the bees would be in direct contact with the sections, they would carry across some of the old comb, and the sections would be about as dark as the combs opposite. With 5 top-bars, which I used exclusively for many years, the same thing would happen to a certain extent if no slab honey-board was used, especially if the sections were left on some time before being sealed.

So if the prevention of burl-combs by deep top-bars be all a delusion—which I do not believe—and if there is a loss of 1,000 to 2,000 cells to a comb—a lesion which I very much fear—then I am believing— I still want 3/8 top-bar for the sake of having the sections so far from the brood-combs. The bees would not find it convenient to carry up a lot of black wax to spill the snow-white sections.

The Poison of the Bee.

The inflammation and other unpleasant sympotms which usually appear after a bee sting are often attributed to that sharp sting, so widely distributed in the animal kingdom, and known under the name of formic acid. This acid is, however, has not only the power of causing swellings, its utility to the bees is quite another character. Prof. Joseph Langer, of Prague, a little while ago, in the sections 2,000,000 of the poison-glands of 25,000 bees. This he found to be a clear liquid, soluble in water, with a slight acid, and a very characteristic smell, which, however, soon passes away; this scent can, therefore, be the poison. The formic acid which gives its peculiar acid reaction to the contents of the gland is also very eavénescence. The contents of the gland itself retain their poisonous properties, however, even when dried and subjected to heat. The poison is, therefore, suppose, a vegetative base, an alkaloid, in the most active poison-sens in the vegetable kingdom is known to be.

Prof. Langer proved that the poison has no effect whatever on a healthy skin; if, however, injected under the skin, all the symptoms of bee-sting set in. Should it reach the larger veins or arteries it causes, a general disorder of the system, which remains one of snake-poison. The weight of the poison injected into the wound made by a bee's sting is between 2-10,000th and 6-10,000th part of a gram. The largest part of this is in the formic acid, which is such an important factor for the well-being of the bees. This works as a poison, which destroys the honey, owing to its acid reaction. The bee allows a little formic acid to fall into each cell filled with honey before the closed top, so that the quantity is enough to prevent fermentation. Honey extracted from unsealed combs never known to bee unless 0.1 percent formic acid is added, which is all that is required. — Translated from the German by R. Hamlyn-Harris, in the Brittish Bee Journal.

Weight of Bees and Their Loads.

The following Stray Stray appears in Gleanings in Bee-Culture:

Alex. Astor reports in Reven Int., that he made an examination of 12,300 bees in all, and he gives in milligrams the weights of different kinds of bees. From this

1 I deduce the following table, showing the number of bees in a pound avoirdupois:

<table>
<thead>
<tr>
<th>Bees</th>
<th>Pounds</th>
</tr>
</thead>
<tbody>
<tr>
<td>4604</td>
<td>just out of the cell.</td>
</tr>
<tr>
<td>4986</td>
<td>falling before a swarming colony (probably 2-3 days old).</td>
</tr>
<tr>
<td>2457</td>
<td>wax-workers.</td>
</tr>
<tr>
<td>3574</td>
<td>swarming workers.</td>
</tr>
<tr>
<td>4500</td>
<td>black workers in May-June.</td>
</tr>
<tr>
<td>5056</td>
<td>Italian workers in May-June.</td>
</tr>
<tr>
<td>5151</td>
<td>black workers in July-August.</td>
</tr>
<tr>
<td>5272</td>
<td>Italian workers in July-August.</td>
</tr>
</tbody>
</table>

According to that, the load of honey of a swarming bee is about 1/4 it's own weight. —This table is exceedingly interesting—the more so, as I think the figures very well the figures that have been given heretofore. It appears, then, that bees weigh more during the swarming season than that which weighs the most of any. This fact is as well as interesting. It appears, again, that in May, June, July, and August the black workers are heavier than the Italian. I had always supposed that the average Italian bee was, if anything, a shade larger or heavier than the black. Is it not possible that the black bees referred to were Carniolans, or of that race, and so weigh a little more, or that the difference of those in the relative weights, for we have to assume that the Carniolan is the largest bee of the species Aüsa mellifera; and we have also assumed that the little black bees of this country are not the same as bees—the smallest. With regard to the amount of nectar a bee can carry, it seems to me the figures I have here before me as without any in excess of one-fourth its own weight. There, I have just looked it up. Yes, Prof. Knowles says that a Carniolan weighs 0.001 lb. in a pound, and that 10,000 bees can carry a pound of nectar, this being the fewest number to carry an amount of nectar, according to this, than a bee can carry half its own weight in nectar. But Prof. Knowles estimates that on an average it will carry more than one-fourth its own weight in nectar; and he estimates with the above figures. But so far as wing-power is concerned, we know that one can carry one pound of nectar in its own weight, and that there is a difference of one-fourth its own weight between and there is a difference of one-fourth its own weight between and has dissected the honey-sac of worker-bees when they were filled with nectar, so that they almost drooped lower than the floor in that entrance. This was, at the time, about the size of a No. 4 shot, or perhaps a little larger.—Extr. in American Bee Journal when writing.

R. W. W. WEBER.

CHICAGO, May 7.—There is very little being done in honey as present with practically no demand for the extracted grades; several consignments for some time have been the receipt of rapeseed oil, I am told, which is being used by some of the larger concerns, with the result that honey prices are being held down. A little choice white comb is in demand, and there seems to be an improvement in the market for white honey. The prices of black honey are about the same as last year. There was a small fair at the recent convention in Nebraska, but the sales were not particularly good.

Weekly Budget.

An appropriation of $6000 is to be used in helping to make an exhibit at the Pan-American Exposition. Up that way they know how to get up a good show.

Dis-eases of Bees and Legislation.

The title of a new nomenclature issued recently by N. E. France, State inspector of apiaries for Wisconsin. It treats of foul brood, its cause and cure; pickled brood, black brood, dysentery, etc. Under "Legislation" it gives the laws of Wisconsin relative to bees. It can be had free by the beekeepers of that State.

The Home Circle department is thus very kindly referred to by "Stenog" in Gleanings in Bee-Culture:

"Prof. Cook's talks for the home circle, now running in the 'Old Reliable,' constitute an excellent feature of it. They bear largely on the proper management of children, and home conduct in general. All who have Mr. York's newspaper will do well to read these lines of Prof. Cook's first thing, as they fit one for what follows. Best of all, we know that they speak from experience, and in his daily life is an expanse of what he enjoys."

French Honey-Caramels.

The Gazette d'Aleppe, a French exchange, gives the following recipe for making caramels, which it pronounces "incomparable." Rose water, 15 grams; powdered sugar, 100 grams; fine honey, 200 grams. Mix and boil, stirring constantly, until a drop of the compound, when cooled, is hard and fragile. Pour out on a buttered or oiled marble slab, and shape the mixture into suitable pieces by means of a teaspoon. So reports Gleanings in Bee-Culture.

Dr. C. C. Miller is nothing if not a crank on the subject of roses. Of course, any one who's kind of a crank is a delightful crank. In Gleanings in Bee-Culture he wafts this bit of rose perfume through a single straw:

"One rose in September is worth more to me than ten in June; as soon as the blossoms-buds show on the hybrid perpetuals I carefully pinch off every one except one or two of the most advanced on each bush. Then the bush is not exhausted with its June crop, so as to give no roses later. Of course, that will not do for June roses, but their stalks are cut back severely in spring, which makes the blossoms a little later, and perhaps a little finer."

Cuban Honey-Plant or Belleflower.

Mr. O. P. Poppleton, of Dade Co., Fla., wrote us as follows May 1:

Friend York — I send you to-day a photograph of my 'Belleflower' plant, taken last December, while it was in full bloom. It grows over the porch of my house. This plant is the source of the honey obtained in Cuba, and I am informed that it is also abundant in other Islands of the West Indies also in Porto Rico, "Pentas belladonna," common name, 'Agualmaido,' while in English it is usually known as "Belleflower." This is one of the Morning-glowes, probably the most abundant bloomer of the entire genus. It is confined to the tropics, as frost kills it to the ground.

The flowers are shaped like a church-bell, are about 1 oz. inches across, and are nearly all pure white, shading into purple and yellow in the bottom of the inside of the bell. In Cuba it blooms from the 25th to late in February. It is a very showy flower, and when in full bloom it looks, at a distance, almost like a snowbank, especially when it runs over hedges or fences. It not only yields large quantities of honey, but it is also the most delicious honey, not equal to the first, but better than the last.

The principal interest this flower has to American bee-keepers lies in the fact that it furnishes nearly all the foreign honey that competes with our product in our own markets. Those of us who have to dispose of our crops in the Eastern seaboard markets, are already feeling the result of its competition.

Mrs. Geo. Jackson, of Grand Traverse Co., Mich., is one of the growing number of very successful women who keep bees. The following paragraph from Gleanings in Bee-Culture tells something of the results she has obtained:

"In the fall of 1898 I had 18 very strong colonies, and in the spring of 1899 I had still 18 strong colonies. Well I feared and do still feel, proud of those bees. They commenced work the first day they were out of the cellar, and worked every pleasant day in May and June, until heavy frost came in the fall. One colony, the 'Queen' of my apiary, did itself proud. During the season we took 10 supers of well-filled and nicely capped white honey, each super containing 24 pounds. It did not swarm, and we had a heavy flow of basswood honey. The other colonies swarmed early, and June 30 I had 35 strong colonies. I did not get less than two supers of honey from any colony, and from many of them four."

Mrs. Jackson says that Mr. Jackson has given up all claims to "the only privilege of eating the honey." He is a wise man. Any man who has a wife that can get such results from bees as Mrs. Jackson has done, can do no better than simply to lay claim to his wife only, and then let her manage the rest. Her price is far above — well, say $200 red-clover queens?"

Manfield Parish's fine decorative design on the cover of The Ladies' Home Journal for June forms a fitting introduction to an admirable illustrative article, in which the most interesting features of this number are a double-page of pictures, entitled, "Where Golf is Played," showing some of the handsomest country club houses in America; a series of curious "Love Stories of the Zoo," told by Clifford Howard; the first installment of a fascinating new serial, "Elven," by Elizabeth Knight Tompkins; a touching full-page picture of "The Passing of the Farm," by W. L. Taylor; the queer experiences with "Some People I Have Married," by the Rev. D. M. Steele, and a vigorous article on "Women as Poor Pay," by Edward Bok. Numerous other articles of special and broad interest fill out the rest of the number. By The Curtis Publishing Company, Philadelphia, Pa. One dollar a year: ten cents a copy.
The Freight-Rate on Comb Honey was left unchanged by the Western Classification Committee at its recent meeting in California. We suppose bee-keepers ought to be grateful for this, but in all justice to comb-honey producers, the rate should be reduced. Perhaps with the proper effort on their part at some future time the reduction will be secured.

Steam-Press Wax-Extractors.—A late number of Gleanings in Bee-Culture occupies several pages discussing wax-extractors. It seems that for several years in Germany and France, and more recently in this country, wax-extractors have been in use by which the wax is pressed out by a screw-press, the press the all while being kept within steam, so that there is no danger of the wax charring as when taken from a heated plate and put in a press in a lower temperature. Some object that these steam-press extractors are on too small a scale for rapid work. Gerstung, a German editor, has invented a press to work in hot water, which he claims is better than in steam. It is possible that the solar extractor may have to take a back seat for something that will do more thorough work in getting the wax out of old combs.

Four Brooks in Michigan.—Geo. E. Hilton, president of the Michigan Bee-keepers’ Association, sends us the following concerning the four-brook law in that State, which he desires all Michigan bee-keepers to read:

To the Bee-keepers of Michigan.—So many letters are coming to me regarding the four-brook law in Michigan, that I will try, through the bee-papers, to answer in a general way, and save myself valuable time at this busy time of the year.

First, the law is in operation to-day, and the inspector is appointed. I feel very much relieved, I have made four trips to Lansing in behalf of the measure, and it required all the influence that myself and others could bring to bear to secure its passage, as its importance was so little understood. I have paid out about $50 in expenses, to say nothing of the time I have donated, which would amount to as much more. And now I want the bee-keepers of the State to take advantage of the law, and receive the benefits that may come from our efforts.

I went to Lansing last week, spending a portion of three days, and succeeded in having John M. Rankin, our State apiculturist, appointed as our inspector, and I know of no one that can better attend to the work, or who is more worthy of the position. The work is under the management of the State Dairy and Food Commissioner, Hon. W. B. Snow, of Lansing, Mich., to whom all communications should be sent. He is in direct communication with the Agricultural College, and will inform Mr. Rankin what is expected of him.

We have but 8500 to use this season, but as the necessity of the work becomes apparent we shall be able to get more. The disease has an alarming foothold in our State, and it behoves every bee-keeper in Michigan to do his whole duty in assisting in the extermination of this dread malady.

Trusting this will make everything plain, and save me many personal letters, I am

Very respectfully yours,
Geo. E. Hilton.
President Michigan Bee-keepers’ Association.

Mr. Hilton and others deserve the thanks of every Michigan bee-keeper, for their successful efforts in securing the passage of their four-brook law, and also for the appointment of Mr. John M. Rankin as four-brook inspector. Now, let all cooperate in the attempt to eradicate completely the scourge which Mr. Hilton says has already gained such a foothold in Michigan.

Other States should promptly follow the good examples set by Wisconsin, Michigan, Colorado, and some other progressive States that have been wise enough, and energetic enough, to enact laws for the purpose of protecting the bees from the deadly disease of foul brood.

Let us all hope that after the bees, the hogs, the cattle, and all other farm livestock have been fully protected, our legislators will wake up to the importance of protecting that "best crop of the farm"—the boys and girls—from the curse of the saloon. Up to the present time they are not considered of sufficient value in most States to overbalance the greed for ill-gotten financial gain.

Simkins’ Method of Introduction seems to be gaining in favor. Confine the queen lasting for 30 minutes, keeping her warm, and let your queen quietly in at the top of the hive, invading and following with a puff of smoke. This at night. Then do not disturb the colony for 18 hours.

Decay for Swarms.—Mr. Doolittle says in the Progressive Bee-keeper that years ago he hung up dried mullen tops that had been out over winter, for swarms to settle on, and three out of four swarms chose those settling-places. For those who allow natural swarm-ing he commends the following, which he cut out of an old newspaper:

"A good way to catch swarms is as follows: After each melting of wax preserve the residue of dirt, pollen, cocoons, etc., which is left after the wax has been pressed out, until enough for the purpose has been obtained, then will add to it one-half pound of resin and melt it all in an old vessel. Then having secured some old mullen tops, take an old spoon and spread some of the mixture onto one side of two or three, then keep adding more tops and of the mixture, until the whole covered together is a fairly good representation of a swarm of bees, when you have an excellent bee-bob. When the swarming season comes on, hang your bee-bob on the limb of a tree or a pole in the apiary, within the reach of your hand, and of the bees also, and surely every swarm will settle on it. For something to hang it up by, put in a good, stout wire while making, cementing it in at the center."

A School for Bee-keepers is one of the up-to-date things in Vienna, Austria. Government aid has been secured, ground purchased, and a building erected. The German bee-journal, Bienen-Vater, has a fine picture of the building, and another of the apiary. A chief course is to be held some two weeks, beginning in June, with a possibility of the same being repeated. Only 20 applicants will be received at these chief courses. Subsidiary courses will be held on 10 specific afternoons on different dates from June to September, allowing 40 to attend. Tuition is entirely free.

Depending Upon Bees Alone for a Living.

BY C. DAVENPORT.

I have noticed that the question, "Is it safe for one to depend upon bees alone for a living?" is one that is frequently asked, and Dr. Miller has ably handled the subject a number of times, but perhaps a few words from me in regard to the bee-keeper’s livelihood will be considered out of place. I am one of the few who are specialists, that is, I have no other business or occupation of any kind except bee-keeping, and I have made a living and enough so I could stand a few failures without going to the poorhouse. But I am not bold enough to change the occupation, and it is not likely that I will ever do so. And while I should not advise a young man to take up bee-keeping as a life work, in my opinion there is no question but what a living can be made at it in a good locality, if one understands the business and is willing to work at it. There is, though, no need for a man with a family to depend altogether on bees for a living, for he should own at least a few acres where the home yard is located, so that a few cows and pigs, and a large flock of poultry, with 300 to 400 colonies of bees, would, in a good locality, insure a living for a family, and a bank account as well.

I am acquainted with a bee-keeper who has about the above number under his care, and has made something, about $1500; though this to some might be considered a small amount, here it is considered a large income, and by some would be looked upon as a small fortune. Though we are not as bad here in this respect as a man from one rival region who wrote to a firm in regard to their lowest-priced saw-mills. Soon after the information was sent, the firm received the following letter from him:

"Dear Sirs,—I ain’t a joiner but any saw-mill. What do yer take me fer? If I had $800 do what dear I wud want a saw-mill fer?"

It seems that in his locality $300 was considered enough so that any further requirements would rise to increase the amount was needless. And as with this man, some may find that it costs more to secure and properly equip 300 or 400 colonies for either comb or extracted honey than they think it does; and to make a success of bee-keeping at the present time, modern hives and apparatus have to be used. It is so now in any business or pursuit. To succeed one must keep abreast of the times, and the profession of bee-keeping is not as easily acquired or mastered in all the many details essential to success as many imagine, for practically in few if in any other pursuits is there so much conflict of opinion as there is in ours. So many of these important details must be settled and determined individually, for the methods and appliances that work well with some, may with others in a different, or even the same, locality, be a failure. For instance, about the worst investment I ever made in our fixtures was for 40 wood-zinc queen-excluders. Do not ask why I did not purchase the patent excluders, for I use a large number of them, but they are all-zinc. I know that many prefer wood-zinc to all-zinc, but with me they are worthless.

The way I remove an excluder from a hive is to insert the thin edge of my hive-tool under it, and strip it right off. When this is done here with wood-zinc, the very thin pieces of wood that hold the zinc strips to the wood partitions are also stripped off, and unless this is done, they come to pieces. It is the amount of character or stickiness of the propolis gathered in my locality that causes this. Even with the all-zinc-wood-bound ones, the thin part of the wood frame that holds the zinc soon peels off, and the frame is made for them that will hold to be stripped right off, no matter how badly stuck to the hive and top-bars they are. Of course, one could use enough care to remove anything without injury, but I have not time for this. During the busy season I have to make things move quickly, and it is money worse than wasted for me to invest in, or keep any appliances with which much unnecessary care has to be used, or that requires needless time to handle.

To illustrate again, last season I was explaining to a bee-keeper the great superiority of hives that did not have an entrance cut in the hive itself, which allowed them to be quickly hived up, moved, and be ready for use. He replied that if entrances were cut in the hives, it was desired to tier them up, they did not take long to stuff in rags. It takes more time, though, than I can spend for them. "When the bees are not to be stuffed with rags, it soon goes to the wood-plot. Not but what they can be used so as to help secure as much surplus honey as those which are not defensive, but with me the time lost in fussing with them is soon worth more than the cost towards the hives, and the time saved by me. For, if I must overcome this trait. And after, they have put anywhere from 15 to 30 pounds of white honey in the brood-chamber which should have been in sections, instead of then being willing to work in sections, they are determined to swarm, and I do not, with me, do as much section-work as do the swarms of brown bees. With the latter I can secure practically all the white honey in the sections, whether they swarm or not.

But in my opinion there is as much difference in brown bees as there is in Italians. For extracted honey I prefer Italians; they will gather more honey, go a greater distance, and protect their hive and combs from the ravages of the moth-worms much better than will brown bees, and this is no small advantage.

Some claim that moth-worms never injure strong colonies of any kind of bees, but this is a mistake, for the combs will be injured, and hundreds of eggs, larvae, and hatching brood, will sometimes be destroyed here by moth-worms in strong, thickly colonies of brown bees.

Short-Cuts in Extracting Honey.

Read at the Wisconsin State Bee-Keepers’ Convention, at Madison.

BY FRANK MINNICK.

Solomon says, in Ecclesiastes 1:9, "The thing that hath been is that which shall be; and that which is done is that which shall be done; and there is no new thing under the sun." In passing through the historical records of our State, and after some years ago, I say that the hand of an Egyptian mummy, and wondered if it had not wrought in accord with Solomon’s words; or, in the words of the poet with a line of my own added,

"Perhaps this pretty hand now pinioned fast,
Has loathed glass to glass of Pharaoh’s glass;
Or dabbled his but elegy Queen Dido’s dyes;
Or handled Langstroth or similar hives which are first-class."

But whatever may have been, or whatever of lost arts are buried in the sediment of the Nile, or wherever they may be, we are where we are. Historians look into the past, poets into the future, but we are to deal with the present, so let us get down to business.

Very often the shortest way across is the longest way around, but I wish to call to your minds a few of the short-cuts I have discovered in reading a few workhave culture, and in the 20 short years that I have made bee-keeping a means of gaining a livelihood.

In the first place, it is very desirable that the bee-yard be as large as is in some parts of the country where the bees live in such a way as to swarm toward each other, and the rows far enough apart to leave plenty of room for the "honey-carriage," and a space to work in where scarcely any bees are flying. It is also well to have a lower than the best yard, for one can wheel very much more down hill than up.

After handling many different sizes of combs I have settled down to what the "father of American bee-keep-
ing," our beloved and lamented Langstroth, considered the very best—his 10-frame hive, in brood and extracting departments. I have worked my winter repositories (which are cellars) into extracting-musums, and they are very cool and pleasant on a hot summer day. I have discarded screen-doors and ventilate through screen-windows. Bees will not accumulate on a wooden door and rush in with you by the thousands.

Place the extractor on a platform from two to 4 feet high, and dig a pit so that the honey goes by gravity from the extractor through the strainer to the keg. My strainer-box is made after the Rambler pattern, which is a tight plate, but fairly near the top. The cheese-cloth which I use for a strainer is rolled up on one end and stretched to the other, as it becomes clogged. It is rolled by means of a ratchet-wheel on each roller, held in place by a stake into which the roller will down into. I have also a tin strainer above the cheese-cloth, which catches all the coarse stuff.

For an uncanning—can I use a 200-pound honey-keg with the cells placed on the platform in a box with a bend and nail it together so it will drop down into the bottom of the keg; then make another one that will fit inside of the first one; place unprinted wire screen-cloth on the larger hoop, pressing the smaller one down into the work, which is held in place with a few pieces of lath makes a fine strainer for the uncanning-can; and a hole made in the bottom allows the honey to drain out.

For a frame to hold the comb while uncanning if a strip across the top of the keg 12 inches with a nail driven through each end, between the hoop and stave, to hold it steady; but before I nail it down I drive an 8-penny wire-nail about 6 inches from one end from the upper side, for a piece of wood to hold the hoop and stave. I have this point on which turns our fortune (or misfortune, I sometimes think) holds the frame at almost any angle desired without slipping, and I can reverse it. All these motions which are necessary in uncanning are accomplished with one hand without lifting the comb.

I know of no better uncanning-knife than the Bingham & Hetherington. I used to lay the knife on the strip on top of the keg with the handle projecting over the edge, but usually found one who upsets the "shaver," and I was acting in that capacity one day, when, in handling a heavy, slippery comb I let it drop on the projecting handle, which caused it to jump at me like an animal thing; as poor as its aim was it made a "shar" cut" in my ear, and drew forth rich, royal blood. So now I drive a small nail part way into the end of the handle beside the shank, and hang it inside of the keg.

The Porter bee-escapes are a great invention. I try to get them on at least 24 hours before the first honey is to be extracted, and generally use the same one who upsets the "shaver," and try to have enough to keep us running all day, so I put the escapes on another lot immediately so that they will be ready to extract the next morning.

Now coming to the pleasantest part of bee-keeping, with veal laid aside, sleeves rolled up, and my honey-kegs previously tested with boiling water, I am ready for a big day's run. As the combs are uncanned they are placed on the platform in a box with a tin bottom, from which an active, careful boy runs them through a Cowan extractor. The empty keg is placed on scales under the strainer-box, which will sink at the desired weight, and cause the honey-keg to close automatically, by the spring of the side of the keg, and the frame.

The keg is quickly removed and replaced by another, and so the work goes merrily on, and I am content.

 Shall Bees Be Taxed?—A New Yorker's Opinion.

by Friedemann Greiner.

It is my opinion that every patriotic person, and all good citizens, should be willing, nay, anxious, to pay their just share of taxation, bee-keepers included. If our patriotism makes us liberal only in the expenditure of cashed-up property, and of the time and labor which we might celebrate the anniversary of the Declaration of Independence worthy (?) or perhaps the victory of the Republican party, or any other political party, then our patriotism is not worth much, and leads us astray. If our patriotism does not prompt us to come forward with our treasures, our stored-up papers, mortgages and notes, and demand that we are justly taxed for all we possess, as a reciprocity act for the protection we enjoy, then we would better not make much ado about our patriotic feeling. I am sorry to say that a great many people, even those of high rank, try in every conceivable way to hide their possessions from the eyes of the assessors and tax-collectors.

I am not sure that taxation will ever be equitably adjusted. The situation to-day is practically the same as in the many centuries gone before. History shows that the poor classes of citizens have always been oppressed by the strong and rich classes, which in turn again gave rise to the so-called revolutions. In other words, the common people would endure about so much, but when the pressure became too great, then they kicked. Of this I am sure, that the Christian spirit will so penetrate the heart of each individual, and the masses, that this earth will become more heaven-like, and that self-sacrifice will be driven out; but before that time will come the world will not reach this state of things. Let this be as it may. I do not wish to speak out and avoid being taxed on my bees. What I do object to, is to be picked out of the large number of wealth profiteers and owners as the only one to pay. I am in favor of having all kinds of property taxed, have brains taxed, etc. We did not succeed in having a national income-tax law passed—it was declared unconstitutional. Let us try it again—it is a just and wise course, and the same. Those that have shall give, ought to give!

If I am going to be taxed on my property am I not justifiable in demanding that my neighbors shall also be taxed? Everyone has his property and a large number of my neighbors has six fine horses; their market value is $500; nothing said of the single and double, light and heavy harnesses, wagons single and double, carriages, reapers, binders, etc; he has a head and body of hogs, with a value $800; then he has 100 sheep with a market value of $800 dollars; a herd of swine, valued at $100—all in all, his stock has a value of $2100. Let it be understood that at an open sale his stock would probably bring that amount of money, at least. But a few days ago I asked him how much tax he paid on this nice investment. Well, what do you think? Not one red cent!

I am a bee-keeper, principally. My stock of bees consists of 75 colonies, with 300,000 bees, $300, no more. Of course I would not sell them for that, not even for twice that amount. Besides the bees, I keep one horse and two cows, valued at $150, which concludes the list of my stock. In all it represents in value $450. So much tax I do not consider, unless the wealthy neighbor is exempt on his $2100 stock investment?

When all other personal property is enlisted on the assessors' list and lawfully taxed, then I will cheerfully consent to have my bees listed, also I understand in some parts of the country bees partly assessed, to furbish watches, pianos, other musical instruments, carriages and stock of all kinds. Of course, where this is the case bees should not escape.

But there is another standpoint from which taxation of bees may be viewed. The cane-sugar interest in the South, and the beet-sugar interest in the West and North, are fostered by the Government to such an extent that even a premium or subsidy is paid to sugar manufacturers on every pound of the market. Honey is sugar. Why do we bee-keepers not receive a subsidy on the honey we produce? A great deal of honey goes to waste in the flowers year in and year out. It can not be said that all honey is gathered, as until the bees are ready it is not through the mile. The honey, if left in the flowers, does no one any good. Uncle Sam ought to encourage bee-keeping, to the end that all this honey might be gathered and saved, instead of wasting, producing 25 cents a pound.

And, finally, there are thousands and millions of blossoms that need fertilizing every year. Many fail to set fruit for lack of pollen-carriers. More bees, even if they gathered no honey for us, would be an advantage to the fruit tree growers, wheat, corn, and potato growers. For the sole purpose of fertilizing fruit-blossoms. For this service the bees ought to receive pay and protection, or rather the bee-keeper ought to receive from the Government a certain amount premium, say 25 cents, or more, for each colony kept, instead of being taxed for them. This idea is not a new one, by any means. The people of the middle age valued the service the honey-bees rendered, and did pay a premium for keeping them. I believe I mentioned this
fact several years ago in a longer article on the history of the bee.

That interest in bee-keeping was manifested in a later age by that great king and statesman of Prussia, Frederick, living during the 18th century. His order was, that every minister of the gospel in his kingdom, every order of monks, and all monasteries, must keep a certain number of bee colonies, and every crown tenant paying 150 thaler rent had to keep 10 colonies: those paying higher rent 20 colonies. For every colony less than that number five thaler penalty had to be paid. Each farmer that had more than an average of four colonies, from that number down to one colony, according to the number of acres of land he owned. Failing to meet these requirements, about 50 cents had to be paid for every colony not kept, as the result of which, the queen was required to go to every colony left, and above the required number!

From this it will be seen that Frederick must have been convinced that bee-keeping offered many advantages, and produced great benefits. In this understanding he was far ahead of our time, and any suggestion if a good results could be obtained.—D. C. Roberts, Colorado.

Yes, we practice artificial swarming exclusively, though we do not call it by that name. We call it “division of colonies.” Swarming is anything like swarming. True artificial swarming is done by removing a swarm of bees, the queen in a forced way, either by drumming the bees out from one hive to another, as formerly practiced with the box-hives, or by shaking enough of the bees with the queen to a new box.

I must say, however, that if we were practicing bee-culture for comb honey with the usual eight-frame hive, such as is recommended by many bee-keepers, we should be far from recommending artificial swarming, but since we are trying to devise means to prevent the natural swarming in the limit of our power. From repeated acknowledgments of comb-honey producers who use small hives, I have concluded that this method of bee-keeping produced rather too much increase in ordinary seasons, and that a better method was a method by which less increase could be had.

By our methods, we produce extracted honey almost exclusively, with large hives, always supplied with a sufficient amount of empty comb to prevent the desire of swarming, except in extraordinary seasons. The only desire increase, usually in sufficient amount to make up for winter losses, in each apiary, we follow the artificial methods.

As to the production of as much honey with a colony that has been divided by any manner whatever, either natural or artificial, as with a colony in which all the bees remain at their post, that is out of the question. The bees that are taken away, or that leave with a swarm, go to making that swarm prosperous, they harvest honey for its brood, and for the building of its comb, and, while doing that, they surely can not be expected to produce surplus honey. But if you are in a location in which two crops may be expected—such as is very rare in this country, if the second crop is a very safe probability, then what you may lose in the first crop by dividing, will perhaps be more than repaid by the product of the extra colony which you have brought into existence. You are exactly in the position of a man who is bringing up a family. While his children are small they are a strain upon his energy, for he must support them, educate them, train them to the duties of life, but when the children are grown, they are a very great help instead of a drain upon his resources. If you begin the season with 25 colonies of bees and seek no increase, you may have a very fair crop, but if you double their numbers, though you will have no crop during the early summer, the fall crop will probably be double what it would have been had you depended upon the original number of colonies for your supply.

There are many methods of making divisions or artificial swarming. Nearly every writer describes his own plan, and they are all good, in a greater or less degree, if they follow the first principles of the trade—of leaving colonies queenless the least possible time.

For the new method of queen-rearing, among which the Doolittle method stands conspicuous, it is not very difficult to rear queens from the very best mothers to supply all swarms made. Or, if this be thought too difficult, queens may be purchased from reliable breeders, especially in the South, for a small price. Thus swarms may easily be supplied with very good, choice queens, and little time is lost.

The plan which we follow, and which proves the most economical, is to rear our own queens from colonies which are not likely to give any surplus. This, of course, applies only to an apiary in which the colonies are not all intended for forced increase. If we must have increase at the exclusion of everything else, then let us use every colony of sufficient strength to further our purpose. But if we want an increase of say only one-third, we will aim to leave the most populous colonies intact, taking the brood and bees from colonies which have bred up too fast to make a crop. This must not be understood to mean that every weak colony may be divided, for there are sometimes colonies of bees which fail to breed up, from divers causes, and which remain weak till after the honey harvest. These are of no value, and must be taken out of our reckoning.

But we have colonies of bees that breed up promptly and plentifully at the opening of spring, and begin the harvest with as full a force of field-workers as is possible for our hives to hold. We have at a small expense, and where there are colonies which have been delayed in their breeding by different circumstances, are still quite prolific, and find themselves with a large amount of brood, but with less field-workers ready to take care of it. Our plan is, to take the small colonies that are behind-time for the harvest, and it is to them that we look for the supply of brood for our divisions. There is nothing lost in the way of a crop by dividing them, for they would only just begin the harvest of a swarm, and the brood and bees that they can furnish will give us quite a good many “swarms” that will have enough to make preparations for the second crop. Thus, if there is any chance for honey, our best colonies will harvest the first, and the small colonies will have the second.

But if we breed our own queens, no other considerations should deter us from using the very best colony for breeding the young queens. Prolificness and hardness first, then durability, and lastly, reliability. Reliableness is also a consideration. But if we breed mainly from pure Italians this quality will be a matter of course with every one of our best colonies.

A vigilant eye must be kept on the divisions. Until the bees get a great deal of honey, and the combs are all built, they should not be left to their own devices more than a week at a time. In this way only can we expect to succeed.

"Long-Tongued Bees—Fad or Fallacy, Which?"”

By E. R. Root.

On page 293, I find an article by Mr. G. M. Doolittle under the above heading. “Of late years,” says Mr. D., “some of our bee-papers start off with some new idea, or some old one revived, and in a little while the heads all bloom seem to get twisted... which, a few years later, is dropped, with hundreds and thousands of hard-earned dollars wasted over the hobby or fad.”

A thousand dollars—that’s a big sum, and thousands of thousands of dollars—that’s a very big sum. All fads that have been dropped that have cost anywhere near such sums. Reversible frames? We sold, perhaps, more than any other; and yet we did not sell, all told, $300 worth of them. Self-hives? About 250, at 20th. But we must have some failure fads in order to get those that are a success.

Did Mr. Doolittle never ride a hobby, or push a fad? Well, let’s see. Did he not champion wide frames for sections, that we had to get with 17 years ago? And now they are used by very few, including Doolittle. Was he not one of the very first who started the fad for tall sections? Did any one waste thousands of dollars on short-haired bees? I can not recall one. He started the fad for rearing queen-cups, and the good show a good Queen-cups. Did he not waste thousands of hard dollars on that? But the fad may be dropped for drone-comb queen-cups. He helped boon, years ago, in his pamphlet, “The Hive I Use,” the gallop hive; and some of his followers, as I happen to know, wished afterward they had not followed him, because they had on their hands
a lot of odd-sized hives. But now Mr. Doolittle says the Langstroth is just as good as the Gallup, and has the advantage of making thought bear. And that reminds me that Mr. D. has decried other fads which he has since adopted. He condemned, for instance, thick-top bars, on the ground that they were burr-catching. But he has been compelled to use them. He also ran against the idea of warning, that there are not positively sure that the amount of honey a colony will gather is in direct proportion to the length of the tongues of its bees. But, as you say, there is nothing wrong in selling them. If one wishes beauty, he has a right to pay for it, and the breeder to sell it; but when Mr. Doolittle condemns others for pushing, I fear he has the same mania himself.

He is selling the Prominent with a promise of bringing in more honey—he should not forget that there may be others who may be equally honest in advertising and selling long-tongue bees.

He apparently questions the propriety of charging $10, $15, or even $20 for queens. If so, it is wrong for him, but perhaps in a lesser degree, to charge $5.00 for his best queens. It may be that no single bee is worth $25. I have no quarrel with any one who so thinks. I know this: We refused a five-dollar offer of a breeder to sell red clover bees right to sell stallions, Jersey bulls, dogs, and roosters of high blood, at big prices, is it awkwardly wicked to sell queen-bees at ten and twenty-five dollars? Certainly not; for Mr. D. has said that the queen is the pivotal center of the colony, and in the same way an extra-golden one is the pivotal center of a whole apiary.

He quotes Stengel, in "Pickings," as saying that no one claims that the long-tongued bees would be any better except of red clover honey. He is on to say if this is correct, "then these long-tongued bees are of no special advantage to me nor to two-thirds of the acreage of North America. I never claimed that the long-tongued bees would be any use to me..." There is no access in bee-culture. The fact is that there are other honey-plants that have deep corolla-tubes. I refer especially to the Compositae family. Then there are certain corolla-tubes in the heads of alaski that are too long for the bees to reach to the bottom; and there are certain tubes of even white clover that are somewhat long for the tongue-reach of the average bee. If there are other honey-plants that have deep corolla-tubes, then practically all of Mr. Doolittle's arguments fall to the ground. He certainly knows, however, that in his own bee-paper, the United States is decidedly different, especially in the South; and he must not judge the whole United States by the vicinity in and around his place of residence in Onondaga County, N. Y.

He says, further, that he finds breeders in the extreme Southern States, such as Florida and Texas, advertising long-tongued queens, "as just as if those long tongues were a great desideratum for that Southern country." Why, Mr. Doolittle, is it not a fact that most of the Southern bee-queens are sold in the North? Can't you see, for instance, how a manufacturer of stump-pulling machines, located on the prairies of Illinois, might sell such machines in localities in other States where such machinery would be in demand?

The quotations Mr. Doolittle makes are, in fact, from one of Mr. Hutchinson's advertisements, from some of my own writings, and from a statement or two in the American Bee Journal. 100% of these statements were:

"To give misleading statements, or those that are actually false, is something that our bee-papers of the present day should not stoop to do—not even when the motive of gain kornered its advertising." Why, Mr. Doolittle, is it possible that Mr. Hutchinson, the editor of some of the other bee-papers, and all these other brethren whom you have quoted, are putting out "statements..." that are actually false, just to "sell"...? "gain"? I can not think you believe that. They may be misled; they may be mistaken; they may be wrong in their opinions; but falsifiers for gain, never.

The next point is whether it is necessary to "call a halt," I partly agree with you; but it seems to me, Mr. Doolittle, in view of what I published on page 295 of Gleanings, that you are somewhat late in the day. After making all those quotations, and putting them in such a way as to give the impression before the readers, not that those of us who sold long-tongued stock had quite lost

our heads, you might, in all fairness, have given other quotations from the same writers that hold up the danger-signal. For example, on page 285 of April 1st Gleanings, I said:

"There is danger that many who get queens of this blood (long-tongue) will be disappointed, and in the end the whole business be prejudiced. The reason for warning...is not positively sure that the amount of honey a colony will gather is in direct proportion to the length of the tongues of its bees..." In any case, we do not love our local "bees.")

Again, on page 401 I published something more in the same line. I did not give these editorials because I thought it was necessary to call a "halt," but only to draw attention to certain phases of the question that were liable to abuse, and to prevent, if possible, probable disappointment.

Mr. Bond is not repeating that the red clover is not the only plant, by any means, that has long nectar-tubes. Second, that, if we succeed in getting long-tongue stock, we shall have bees that will get more honey out of alaski, as well as more honey out of red clover, and they might be the answer to the beehivists who have been telling us for years past that clovers have a stocky, vigorous growth. I have seen the corolla-tubes of alaski as long as the tubes in ordinary red clover in common seasons, and I have seen the nectar-tubes of red clover, which are the same length as those of them—too deep for the average bees to reach the bottom of.

I desire to say that I believe Mr. Doolittle is in his position; but he has allowed his prejudices to warp his judgment, I fear. I bear no ill will toward him, and hope he does not toward me.

No. 5. Practical Lessons for Beginners in Bee-culture.

BY J. D. Gehringer.

Continued from page 295.

"Now, Mr. Bond," I said, after returning with him to the hive chosen as our object lesson, "right here is a practical illustration of what may be accomplished in the direction of increasing the chances in bee-culture. This hive has done wonders so far this season. In fact, it has stood first-rank ever since I first started it with its present queen.

Bee-books tell us that a queen should be superseded the third or fourth year, because at that age queens begin to decline in egg-laying power. I have seen this seemingly orthodox deliverance asserted, re-asserted, and elaborated in the bee-books by bee-keepers whose orthodoxy one would scarcely venture to call in question. But neither bee-books, nor orthodox bee-keepers, are entirely reliable in all things; owing, however, to the fact that many things come to our notice by practical experience and observation, as we pursue each his own theory or plan, that are unique in the sense of being new, or without precedent. My experience with this colony for three years proves that this assertion, which may seem to some like an unjust aspersions, is neither rash nor egotistical.

Well, to illustrate: I took from this hive, this morning, before you came, four supers of 25-pound sections each, all well-filled and beautifully finished, and nearly as white as snow. The fifth super—the one I took off a little while ago—is also full of honey; but, as the sections are not all sealed over, I leave it on the hive until the bees complete their work in it. But, in order to provide honey-storing room for them I shall give them a fresh super directly.

"Now, you see, here is a honey-yield from one colony of five supers, or 140 pounds—all white clover honey. And, the white clover yet being in fairly good condition, there is a prospect of at least one more super being filled and finished: making six in all. Then there is the late honey; the nectar from the alfalfa, of which there is a super for me, and store from 30 to 40 pounds for themselves to winter on."

"Excuse me, Mr. Gelting, for expressing my opinion, but isn't this about the finest honey stock I've ever heard of?"

Mr. Bond was leaning against the apple-tree under which was the champion colony when he made this slangy remark. When I turned to look at him in order to interpret. The beehive on his face was covered, and the honey in his dress not only covered his other honey, but his face, too. He had removed his bee-vest, with his hat, and was...I thought rather nervously—mopping his jovial face with his red pocket handkerchief. It was evident that he had quite forgotten his previous precautions. I had put through them just then, however, for I had not yet opened the hive, but was standing near it with my
frame-prying instrument—an old chisel—in one hand, and smoker in the other. I saw a merry twinkle in my friend's blue eyes, but otherwise he looked supremely unconscious of having said anything at all funny of improper.

"Mr. Bond," I do, said I, "do you at all think they would allow the poor old bee-queen to live, and proceed from the time it was put into winter quarters. At the top edge of is seen the figure 4, which denotes the number of the colony.

"Why don't you put the number on the front of the outside," queried Mr. Bond.

"Because it is better to number the colony instead of the hive," I replied. "When a certain number is made once painted on the outside of a hive I can't very well change it to another number, though I may have the best of reason for wishing, and a rainy day the larger the excellent bekeepers who do paint the number on the outside of the hive, and they have the right so to do. But I think a better way would be—if they must have the number on the outside—to paint it plainly with the Queen designated on the front of the hive; then it would be easy to change them from one hive to any other when occasion required it.

"Your idea looks reasonable and sensible to me," remarked Mr. Bond. "But," he continued, "will you please tell me what kind of an occasion would require the change you speak of?"

"One such occasion would be, when the colony casts a swarm," I answered. "Take, for illustration, the swarm we have just hived. The hive it came from is number 9, on the card inside the cover. That number designates the colony, or more correctly, the queen. But the colony left the parent hive, and the queen went with it; hence, I take the record-card from the old hive and tack it inside the cover of the hive the swarm is in. In that way I keep track of the mother-queen as long as she lives, without confusion, and with the least possible trouble. But there is another reason why I transfer the number from the old to the new hive. If I do not do this, I shall have to get back to it to look after that drone-brood, and to do one or two other things that will be found necessary, I think, within a week—or I don't think we can more than finish the lesson I have for you here this afternoon.

"Why, you don't intend to keep me here till dark, do you?" anxiously inquired Mr. Bond.

"No," I answered. "And that is just the reason why we can't finish the lesson to-day. You see, I make it a rule in my classes never to molest my bees, in any way, after sunset.

"That's queer," remarked Mr. Bond; "I had a notion the night-time was the best to monkey with bees. My father thought so, for he never touched a hive during the day, except to hive a swarm."

"That merely proves that you and your father knew nothing about the nature and habits of bees," I replied. "I know lots of people who think a cloudy day is a better time than a sunny one for bee work on or among the bees, supers, looking for queens or drone-brood, or exchanging and interchanging brood-frames—bears without an novice on a clear, warm day. The bees are then nearly all busy about their own business, and the warm weather is in the fields. Hence, there are less stings and less labor for the manipulator, and less annoyance for the bees. There is only one exception to this, when regarded as a standard rule, and that is a case in which I am going in the apiary. In that case all regular work among the bees must be suspended until the fraises is settled, and everything is restored to its normal state in the apiary. I will tell you more about robbing and robbers some other time. We must hurry and get on with the lesson in hand.

"Well, you can see that this record-card indicates the age of the queen, and that she is full-blood Italian. It also shows that she is clipped.

"Clipped?" queried Mr. Bond, doubt and wonder in the tone of his voice as he spoke the word. "I don't understand what you mean by that."

"I suppose you don't," I replied, "but I haven't time just now to explain. Besides, should I proceed to do so I would probably forget where I am in the course of our lesson.

"Well, the next thing the card shows is the interesting fact that the colony has sealed a number of several frames in February: and the next, that it cast a large swarm April 12; and the next, that before the end of the month the colony was doubled up."

"What's that?" interrupted Mr. Bond, eagerly, coming a step nearer.

"Never mind now, Mr. Bond; it's quite a little story, and a very important thing to know—but I'll have to put you off for a full explanation because it's getting late.

"What I am trying to do is, in an orderly way is that proof which I mentioned concerning the honey-yield from this hive. But first—lest you lose a part of the lesson this card teaches—notice, please, the next items on record:—February 12: 20; Second frame was removed. Following that item you see here a record of dates when the five supers were put on, successively.

"Another thing: Please notice there is a little card on this record—this super'—directing Mr. Bond. to address to the super which I was preparing to remove from the hive when the swarm interrupted us.

"Well, on this card, as you see, is the number of the colony; and next, the number of the super in the order it was placed on the hive. The other four standing in the honey-house are marked in the same manner as this.

"This is the special proof I wanted to direct your attention to in order to satisfy you that bees can, and do, perform wonders in honey-gathering when they have a first-class chance."

"What do you call a 'first-class chance'?" inquired Mr. Bond.

"Now, you've asked a hard question," I replied. "A hard question in the sense that a full, comprehensive answer would cover nearly the whole range of successful beekeeping. I can, therefore, give you only a crumb, as it were, of the whole loaf.

"The first factor in the first-class chance, in this particular case, was, an uncommonly rich growth of white clover, yielding nectar very profusely and continuously for a long time. And another, plenty of young bees in the hive to gather the honey in this; in this case, I think, the super was put on April 12, and thousands more crawling out of their cells every day.

"But the bee-keeper also has a share in the first-class-chance program, if he knows his business and attends to it, and that is, he must know exactly when to give the colony supers; and he must watch very closely to be sure that they never lack honey-storing room above the brood-chamber while the honey-flow is on.

"These are, I think, the main points. But numerous other things are important also, which, if ignored, or neglected, or not recognized, will cut an abnormally large hole in the honey crop, whether the crop is from one or 50 colonies.

"Do you put all the supers, needed by a colony, on at once?"

"I glanced at my friend sharply, when he asked this question, to see whether he was earnest or in fun. Satisfied that he meant it seriously, I answered:

"No, indeed, Mr. Bond. I put one on first. When that is about full, and I see that the bees are sealing the sections over, I take off and put an empty one in its place, replacing the full one by putting it on top of the other. Thus I continue to put on supers as needed, Mr. Bond."
Questions and Answers

Conducted by
DR. C. C. MILLER, Marengo, I1.
(The Questions may be mailed to the Bees Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail—Errors.

Perhaps a Starving Condition.

I have wintered my bees all right, but I have noticed for several mornings that the full-grown young bees come out until the ground in front of the hives is covered with them; and they won’t go back to the hive, but crawl around until they die away. These bees must either go out at night, or very early in the morning.

ANSWER.—It is possible your bees are in a starving condition. If you find no stores in the hive, feed at once. Sometimes a colony swarms out in spring because short of stores, or for some other reason, and if the queen does not go with them they return to the hive leaving the young bees crawling about on the ground. The most you can do is to see that they have stores, and keep the hive as warm as possible by shutting up any cracks and allowing entrance for only a few bees at a time.

Carrying Queen-Cells a Distance.

Can queen-cells one or two days before hatching be taken three or four miles if left on the comb? Have you ever tried this?

ANSWER.—Yes, I have tried it successfully a number of times. I have taken to an out-apiary a queenless colony with a good queen-cell on each frame, put each frame with its adhering bees in an empty hive as a starter for a nucleus, and obtained good queens thereby. I suppose, however, you mean to take the queen-cell without bees. That I have also done occasionally with success. The cell should be well advanced, and must be kept warm and not subjected to severe jarring. Pack in cotton in a little box, and carry the box in the vest pocket or some pocket close to the body so it will not chill.

Poisoning a Neighbor’s Bees a Crime.

1. When I cook and prepare poison like Bordeaux mixture, etc., for my plants and shrubs on my own property, and my neighbor’s bees come and eat it, are killed thereby, can I get into trouble for it?

2. When my neighbor’s bees come and rob mine, kill them and take their honey, and I, in a chemical way kill the robber-bees on my own property, is there anything wrong in it? If not, this protects my property?

ANSWERS.—1. The man that cooks poison that his neighbor’s bees may get is cooking trouble for himself, most decidedly. The idea that a man can do wrong to others just because on his own property is a pernicious mistake. If a man comes on my property that I don’t want there, and he has no business there, and I may order him off; but if I shoot him because he doesn’t go I’m sure to get into trouble. Still more have I no right to destroy my neighbor’s bees when they come on my property, for bees have a right to come and eat food when they want it, and if I put poison where they will take it I am responsible. There is, however, no danger in spraying plants and shrubs unless they are in bloom, and an intelligent man will understand that it is of no use but a harm to the plants to spray at that time. When not in bloom, there is no danger to the bees, because the bees visit the plants only when in bloom. Of course if the poison were sweetened the bees would visit them any time, but the sweetening would be of no use to the plants, and a man that would sweeten the poison for the sake of poisoning the bees ought to suffer the full penalty of the law.

2. Most assuredly there would be great wrong in it. If your bees come to rob my bees, it is not your business to keep them away, but it is my business to manage my bees so that no other bees will rob them. If I leave honey standing around so as to start robbing, then I am to blame and have done a wrong to myself and to you. If I have weak or queenless colonies, I must protect them or unite them, so robbers will not trouble them. Set it down as a fixed principle that if I allow your bees to rob mine, I am the one to blame, and it is a damage to you to get your bees in the way of robbing, and if I then try to poison your bees I am stooping to so mean a thing that the law ought to handle me pretty roughly.

Extracting Propolis.

I have quite an amount of propolis scrapings on hand. What is the best way to extract or melt it?

ANSWER.—I suppose your object is to get the beeswax out of it. I’m not sure I know the best way. I once took a dripping-pan filled with it, put it in the oven of the cook-stove, and when all was heated for some time poured or dipped off the wax. Possibly if water was added before heating, the wax would rise to the surface and the propolis sink to the bottom. Then when cool it would be easy to lift off the wax.

Simpson Honey-Plant in Kansas.

Would the Simpson honey-plant do any good in this dry climate? The cloeome does well here.

ANSWER.—Very likely it will grow well enough, but it would be worse while to sow it in waste places only. It is probably, not held by the one now that it would pay to occupy tillable land with it.

Management for Increase.

I have six colonies of bees which I want to increase to nine, and not allow them to swarm. Three are black and three are Italians, and I want to increase the Italians. My plan is this: Drive the bees with their queen from the Italian hives to new hives with full sheets of foundation, and place on the old stand, and place the old hive in the place of one of the black colonies, removing the colony of black bees to a new place. Do you think this is a good plan for dividing? Do you think it will keep them from swarming?

MISSOURI.

ANSWER.—Yes, the plan will work. The change should not be made late in the day, lest so few bees enter the hive of brood that it be chilled. Do it early in the day, or still better, the time the bees are out for a play-spell. It would, of course, be better if you could give a queen or queen-cell to the queenless hive, for only field-bees are there, and they are not the best to rear a queen. If moved, however, at time of play-spell, there will be a young bee that has been driven from its queen (and you would not do to wait late for fear of swarming) there is danger that the removed black colony will soon become strong again and swarm. It will help to prevent this if at the time of removal you shake off into the queenless hive all the bees from three or four frames. If you leave them to rear their own queen, these young bees will be an advantage in that regard. But there may be danger of swarming from the queenless hive when the cells mature, so you might cut out all cells but one.

“The Hum of the Bees” is the name of the finest bee-keeper’s song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a “hummer.” We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at $1.00.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for $1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.
The Afterthought.

The "Old Reliable" seen through New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

ACTIONS OF BEES AT SWARMING-TIME.

And so B. Ginner wants to know if bees pile up in front of a swarming hive in weight enough to touch off a mechanical alarm? And how would you handle an alarm? Bees have forty different ways of swarming. I should not be surprised to see several ounces clung together on the ground in front; but once in fifty times would be sufficient to expect it, I think. Usually the bees aren't concerned; they are mostly swept out in the rush; and many of the bees crawl around awhile before they can get the use of their wings. Machinery would have to be made pretty delicate to spring with their weight; but I guess the thing is possible. If B. G. will rig a second entrance somewhere about a half way in the rear end of the bottom-board, I think he can get all the power he needs by means of it. The idea is to have a long crack there almost wide enough to let out bees, but not quite, and a swinging plate on which the joint push several dozen bees could be utilized. At ordinary times a bee doesn't want to get out except at the habitual place; but in the usual forms of swarming the sentiment seems to be any way to get out, or any where. Page 293.

THE LAYING CAPACITY OF QUEENS.

That Langstroth experiment on page 248, where queens are made to do their work—some thirty, sixty, and some a hundred fold,—and the colonies turn out accordingly three months later— it is striking and instructive; yet there is danger of predating far too much from it. The queen that dropped only one egg may have been just as good a queen as the one that dropped twenty. It is not only possible, but probable, that each of the queens, with the exception of the first, was laying at just about the rate that the workers were able to care for the eggs. If I am right, no queen in the season will win much in advance of the wishes of the workers. Far be it from me to wish to nullify all the conclusions of the paper referred to. Two things remain after we have made all proper allowances. Stronger colonies will not keep a bitch as good for the requirements of a fair colony. To supersede them is of course just the proper thing to do; only don't make mistakes about the facts. The other thing is that some queens may not waste too much time about an immense colony in which most queens would fall far short. These presumably are of extra value; but their phenomenal laying exhausts them quickly, and they are not likely to last long.

BEES AND FRUIT-BLOOM FERTILIZATION.

Anent the articles of Thaddeus Smith, on pages 262 and 280, denying fruit-fertilization by bees—we can make believe we are Boers, and he can be a Britisher without making believe; and thus we will have a splendid chance to learn courtesy and fair conduct toward adversaries. He's right that pretty much all that class of experiments are inconclusive in which boughs or trees have been covered with fine netting. In thus preventing insect pollination other modes of pollination are also hindered, if not prevented altogether. Our folks must mend this defect and experiment some more. Apparently neither himself nor his friend are well posted in insect lore. We greatly need a skilled naturalist in Michigan in May among the islands of Lake Erie. Quite possibly he would see with half an eye that the sheltered location keeps off predatory insects, and that nectar-loving insects are abnormally thick there. Moreover, from climatic and other causes, these islands are among the choicest spots on the globe for fruit culture. The excellence of results without bees does not show all it seems to. Still, a chance for some competent and friendly hand to show how much better results can be attained without the presence of the honey bees, and your berry bloom, and see how many of us can "pick him in" on his reckless assertion (page 280) that the blossoms of pectillate strawberries do not secrete nectar. Look for bees, of course, but especially look for very small insects.

HEALTH AND BED-CLOTHING.

On pages 248, 29, Prof. Cook has a splendid article on the health of the dear ones at home. I did not attempt to say over again his good precepts, but rather (as possibly is too much my habit of late) "mouse" to see if I can't find a little heresy somewhere. He advocates plenty of bedclothing. He says it's a safe eight hours, and I think of the very prevalent evil of too much bed-clothing. Are we not getting somewhere near the bounds of heresy when we ignore such an evil—as if we should say, Folks ought to care for food, and to think about it? It's half in vain to have pure air outside the "kiver" if underneath, next to our persons, the air is thick with excreted gases and thin of oxygen. And that's the state of things which must exist when the clothes are bathing over us. And is not the result a torpid skin—almost as bad as weak lungs? Or, am I wrong about this whole business?

The Home Circle.

Conducted by Prof. A. J. Cook, Claremont, Calif.

Because You Keep in Tune.

There is a harm in going thru' all God's works of love. It rises thru' the heart of a man, and in his breath a song. And if your heart desires a part, morning and eve and noon, in the wide chorus, sing your best, and always keep in tune.

The roles close beside your ear may grate discordantly. And sometimes all the world around seems to be out of key. But hold the note you know is true, sing clear and sweet, and soon Others will join the melody because you keep in tune.

PRIMILLA LEONARD.

SUCCEEDING BY READING.

I am sure we are all glad that Mr. Hutchinson visited the Coggshalls, and gave us the beautiful picture of the home. The remark of W. L. Coggshall to Mr. Hutchinson is so pregnant with sense and truth that I wish to take it as a text on this occasion, — "The man who reads is the man who succeeds." I have always remembered something I read of Beecher's years ago: "Show me a man's library, and tell me of the company he keeps, and I will tell you the man's character." It has often been remarked that we owe our civilization to the discovery of the printing-press. Sure it is that without the stored-up wisdom which we have in the blessed books that grace our homes, our progress would be very much less rapid. I think I said in a previous number of these "Home Circle" papers that I wished I was able to put the Youth's Companion into every home in our country. I have also said that there were three things I would strive to develop in the child from the very first—as soon as he could lisp "papa" or I could make him understand my voice. These truths are: (1) to love and (2) to read, and (3) to add now that I would also strive to interest the child in reading, good reading, from the very earliest moment. The little nursery magazine should be among the child's first possessions, as soon as it can enjoy pictures or tingle with pleasure at the story. This should be followed by saint Nicholas and the Youth's Companion. Of course, the child can not read these at first, but how delightful it is for father and mother to sand along the Sunday papers to the child. Surely, the Sunday, and surely a little time each week-day can not be better spent by either parent than by giving it to the children with some good book or paper as the third party. If we commence thus early, I think there will be rarely any difficulty in interesting any child of ordinary intelligence in the child book or paper. In case the child does show indifference, the parents should tax invention till they succeed.

I know of one little boy who was quite a trouble to his parents in his very early years by a discounting indifference to book and paper. He would enjoy their reading to him but was very slow to read for himself. A visit to some little friends who possessed a menagerie of white mice, interested him greatly, and he would at once read to them like pets. The parents, of course, were interested in his desire and suggested that he find out where he could buy them, what they would cost, and suitable cages or homes for the little rodents, when they should once be secured. The result was that the little fellow hunted the papers over for advertisements regarding white mice. The parents seeing
here an opportunity at once secured the papers which treated of paper work, and delighted to note that not merely the advertisements but everything about the prospective pets was not only scanned but thoroughly read. The pets came, were housed according to the latest rules and improvements, and were kept under constant observation, and their attractiveness, but the taste for reading commenced in the scanning of the advertisements, ever remained. These parents never see white mice but they feel grateful for their share in the development of a healthy reading which has every advantage to their boy.

Mr. Cogshall’s implied reason for reading—that it brings success—is certainly one not to be neglected. We all remember “Sedan” and the speedy undoing of Louis Napoleon. I have seen it often stated that the greater intelligence of the Frenchman, compared with the Frenchman, is the result of that momentous conflict between the two great nations. I have been greatly impressed as I have visited among our farmers, not only in Southern California, but also in the East, to note how the best success in the field and orchard always were hers in hand in a good library, and excellent papers in the home. It is true that in the past, frugality, native sense, and a close attention to business, would often bring success even to the unlettered. But that day is gone with the days of the past, and we are living reading the weakening to the wall. This is becoming as true in agriculture as in other lines of business. Very soon the man that succeeds must know the best and practice it. He must be fully up to the times. To do this he must possess himself of the best and must be the reader of the same. What has given such sections as Western New York, Northern Ohio, Michigan, all of New England, their supremacy in the way of progress and advancement? I unquestionably it came from the fact that they are predominantly a reading people. The home-table gave to the home circle the best of books and magazines, and such papers as The Country Gentleman, Rural New Yorker, and American Bee Journal took no second place among the literary works in these homes.

In speaking to our people of Southern California, I often hold Mr. Hay, our Secretary of State, as he has managed the intricate problems of State Government in the past few years. We have been so honored if he had not been a man of widest view and broadest sympathy. In this case the whole world is to feel the influence and receive an uplift because of the wide-reaching strength of a single mind. It goes without saying that Mr. Hay could not have taken the proud place which he occupies except for the fact that he was a man of widest reading. His culture stopped not with his home affairs, but he shows that he understands the temper and relations of the瓦, the people, her nature, her mind, her habits, her life in the world, and her best interests in other. It is, then, one of the best assets that we derive from wide reading, that our view is broadened and we are not disturbed by the petty things of life, but are able to grasp the rich things in life, so that we are able to plan and work for the greatest good of all.

Every right-minded person loves companionship. Even the dear Master, in those bitter hours in the garden, was sorrowful when the disciples fell asleep and could not watch with him in that terrible hour. I better see a good man and a good woman treading life’s pathway alone that I do not feel sorrowful, and wish that a better fortune had granted to them the dear companionship which is the brightest crown of the best home circle. Even the most favored of us can not always have our loved ones about us. Ithaka, cruel circumstance, often forces separation whether we would or not. Then it is that the mind, as a very angel of mercy, who has not driven loneliness from our homes and hearts at least by a short-lived forgetfulness as we have chosen for our companion the treasured words of some great author. That great and best-loved American—Abraham Lincoln—it is reported, had but two books in the long preparatory days of youth—the Bible and Shakespeare. Yet what good use he made of them. The one made him companion of many of the greatest and greatest hearts that ever filled the world. It did did better than this, it gave him a heart that reached out even to the most lowly of God’s people and was ever alive to the needs and sufferings of those about him. Except for reading, and these two great teachers, who were so good companions during the long, proxie days of Lincoln’s boyhood, we should have been poor indeed, for we should not have had Abraham Lincoln to put the superlatively gliding upon the pages of our nation’s history.

The ability to entertain one’s self, and to be happy even though all our friends depart from us, is certainly one to be treasured among the best of our possessions. A library full of the masterpieces of literature, and a taste and desire to seek out the best they have for us, will do more than any else in the world to drive ennui and the gloom of loneliness from the heart. We may, through the pages of those noble books, at times, find a friend when we have no friends, a comfort when there is no comfort, a courage when we have no courage, and a strength when we have no strength. It is a problem, and one less a puzzle, to many of us to know how to keep the children interested in the home, that they may not know of the evil or be enticed by the sinfulness that the street and even worse places are ever reaching out to lure the children by the wayside. I remember once, a few summers ago, I was dropped at Yucca, one of the most desert places of our great mid-continent desert. Numerous others were alike unfortunate. I think I never knew more yarning in a single day or more complaint against fortune. Yet it was the old hard-bound volumes, describing the natural history of the country and the numerous object-lessons right at my feet which vividly illustrated the word-pictures of the book, made the day all too short. It was with regret that I greeted the evening and the coming train that was to bear me away.

The greatest good from books, is the soul uplift, for this is immortal. Space permits me only to mention it here.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very readily afterward get their subscriptions, for which we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Queenie Jeanette is the title of a pretty in sheet music size, written by J.C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

The Premiums offered this week are well worth working for. Look at them.
AMERICAN BEE JOURNAL

QUEENS!

Improved Golden and Leather-colored Itali- cans are what Home Breeders want. We have one of Root's best long-tongued Red- Clover Breeders from the St. Louis, and a Golden Breeder from Dubuque, who says if there is a BREDER of golden bees in the U.S. worth five, this one is worth that sum. The above breeders have been added to our already im- proved strain on the occasion of this season. J. L. Gandy, of Humboldt, Neb., wrote us on Aug. 31st, 1900, saying that the colony having one of our queen's was already stored over 400 pounds of honey (mostly comb), he states that he is certain they were bees reared on Red Clover, as they were the only kind in his locality and favorite. A. L. Root's folks say that our queens are extra fine, while the editor of the American Bee Journal has good reports from our queens from time to time. We have files upon the subject of queens for sale.

After considering the above evidence, you need only ask yourself, what are your Queen needs each year? Give us a trial order and be pleased. We have years of experience in mailing and rearing queens. Safe delivery will be guaranteed, and instructions for introducing sent with each lot of queens.

To make cows pay, see Sharpe's From Separators. Book "BEE keepers" C. A. H. WEBER, Westchester, Pa.
was in 1917. Since then, as one ever knows who raises California bees, they have had a series of dry years. That being the case, no industry has suffered worse than apiculture, and, to illustrate, I will cite a few of the bees that have come under my personal observation. I will begin with my own apiary: At the close of the season last I had 12 colonies of bees, but sold all but 6 of them. Since then I have bought 201 colonies, and at the beginning of this season I had 14 colonies. I have cared far better than the average, and will give a short table, omitting names, and using letters to designate my respective apiaries in the five counties of Southern California that I know of—their conditions in 1907 and in 1917.

I could go on, but it is unnecessary. This is sufficient to show something of what the loss has been in California; and it is not all, for the honey-producing plants have suffered also, many of them having die.

I think the majority of the beekeepers who have any bees left will try to build up their apiaries, but I have heard of a project that is run for extracted honey will be at the expense of the honey crop.

Up to the present time we have had so much cloudy and cold weather that my bees have stored comparatively little honey, and if any one can, under the new existing conditions, see the project for a large honey crop, in California for 1917, I vote him the prize.

Since writing the above I have received an offer of 4 cents per pound for 1½ tons of nice sage honey. How does that strike you?

J. W. GEORGE.

Riverside Co., Calif., May 7.

Nectar Going to Waste in Michigan.

The bees are very busy on fruit-bloom and dandelion. Bee-keeping is in its infancy in this locality. There are thousands of acres of cherries, peaches, plums, and other fruit-plants in the region, but they have never been used for the benefit of the bees by florists. I am 23 years old, and commenced bee-keeping at 17. I am very much interested in it, and have an apiary of 200 to 300 frames, and I have a good many in keeping.

EMMETT COYET.

Transferring from Box-Hives to Movable Frames.

Some time ago some gave instructions for transferring bees and combs from box-hives to movable frames. I am not in favor of it. I have tried it, and called for thorun through the hoes in the frames into the edges of the combs, thus pinning the bees in the frames. I had a pair of scissors, and even if I had I have a way that I like better, and I think others will. I also have been in colonies in getting the combs to stay in, and it makes them much stronger, too. My plan is as follows:

When the bees have the same as for putting foundation in them. Then cut a piece of board a scant 3/4 inch thick that will fit into the frame. I use a frame a half an inch longer than the frame, and this makes a board of convenient size. say 2 inches larger

I had 60 colonies of bees last fall, but have lost eight of them up to the present time. The bees in bloom, and fruit-trees will be in a few days if it gets warmer. It is quite cool and windy today, and the bees will be in a few seconds.

Bee-Sting Remedy.

I noticed in the Bee Journal an inquiry for a bee-sting remedy. I use iodine, and if applied once the sting will be dulling and the pain will cease in a few seconds. This remedy can be used even on the youngest child.

WALKER CO., AILA, May 14.

Uniting Weak Colonies in Spring.

This is considered by many experienced bee-keepers hive's labor lost. J. B. Hall, in the Canadian Bee Journal, has this to say:

This I have found from practical experience is waste of valuable time. It is all very well to do it as an amusement, but for profit never unite two or three, or ten weak colonies. See that they have emptied their comb, have shut down, and give them a good letting alone, and they will be sure to pull through. If you want ten, and you have only five, there is only one queen left, and that may be the poorest queen of the lot. You have not only the four for the cell, but you have destroyed the good queens, and very likely have a poor one left, and you have nothing but your queen. Don't unite in the spring, let them pull through if they can; if they don't, you have the hive for something better when the warmer season comes. That is my experience after 25 years. I used to unite them, and when I put them together they made a very good colony of bees, both in honey and combs, and in three weeks from that I had only one colony of bees, and, therefore, I think my time was wasted. You know as well as I do, that those bees are old, and will live a few weeks only, and they don't pay for the labor of uniting them with a colony that has a queen. You may lose your queen by

Red Clover Queens

LONG-TONGUED BEES ARE DEMANDED NOW.

One Untested Italian Queen FREE as a Premium for sending us two new subscribers to the American Bee Journal for one year (with $2); or, one Tested Queen free as a premium for sending us four new subscribers with $4.00.

We have arranged with one of the oldest and best queen-breeders (having many years’ experience) to rear queens for us the coming season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veiling or smoke. They stored red clover honey last season.

Orders for these fine, long-reach queens will be filled in rotation—first come, first served—beginning about June 10th. It is expected that orders can be filled quite promptly, as a large number of nuclei will be run. All queens will be guaranteed to arrive in good condition, and all will be cliped, unless otherwise ordered.

CASH PRICES of these fine queens will be as follows: Untested, $1.00 each; Tested, $2.00 each. Send all orders to

GEORGE W. YORK & CO., 144 & 146 Erie St., CHICAGO, ILL.
left the bees no place to store the diseased honey, and forced them to keep it until they removed it and disposed of it.

All of these plans and methods I studied out 25 years ago last summer and fall, when I had over 1,000,000 bees in my own apiary for foul brood.

When foul-brood matter is drying down it glows with a bright light, which is visible within the cells, and there it will remain as long as the comb lasts, and during honey-flows the bees must draw off these cells, and after that foul brood is spread through the colony in proportion to the amount of honey that is fed. From the diseased cells to the sound larve.

In the honey season, when we are taking the combs out of the diseased colony to cure them, the bees (dining on the unsalted honey so handy with no unloading to do) rush into the open cells and take all the honey they can. Most of the diseased cells are full of unsalted honey (as they usually are at such times) the bees will get pretty well filled up with diseased honey before all the combs are removed. To cleanse the bees of this honey I give them starters of comb foundation, and in four days the bees make then into little pieces of comb and store the diseased honey in them. I then take the combs out of the colony and treat them with the bees made in the four days and give them full sheets of comb foundation, and before this is worked on. I complete the process. This is the safest and most practical method for all classes of bee-keepers to follow, and one that never fails. It is one thing to have an apiary of foul brood and quite another to do it and make more or less increase and have all colonies in grand condition when the season begins.

When I am examining an apiary I mark each colony according to the condition I find it in. If I see sick colonies on the front of the hives that are strong in bees and have only a little of disease; two crosses on those that are loaded with disease, and three crosses on those that are weak in bees and badly diseased. In the evening, in the hives, I take off the combs with the bees that have the three crosses on, and shake the bees of every three into an empty hive, so to get rid of the dead bees. Next day I will then remove the combs out of the hives that have one cross on and shake the bees right into the comb.

Where I find only a few of the disease colonies that have large quantities of nice, sound brood, I save this brood with some bees on it and set them back in the hive with allowed then set these backs a little distance from the others, and when the crowd of brood is hatched I go in the evening and shake the bees into a single hive and treat them and give them a queen.

All caring and treating of diseased colonies should be done carefully. I have no reason to have any swimming out and mixing in with others, or bees returning to the old stands after being with their fresh ones. This same method of caring can be carried on at any time from May to October, when the bees are not gathering any honey, by feeding plenty of sugar syrup in the evenings to take the place of a honey-dew.

All the combs and pieces made in the four days could be disposed of by me, Wm. McEvoy, in the Canadian Bee Journal.

The DUPLEX AUTOMATIC DALL BEARING WOVEN WIRE FENCE

100 Different Styles of Fence. — It seems almost past believing that one little machine which can easily be handled and moved about can carry off the work of weaving over 200 yards of fence and kinds of farm, lawn, poultry and ornamental fencing. This is, however, true of the Duplex Ball Bearing Woven Wire Fence Machine. It is manufactured by our advertising partners, the Kettisman Brothers, of Muncie, Ind. The cut shown with this article gives a very good idea of the machine and its method of operation. It also shows one style of farm fence in course of construction. The Duplex will handle satisfactorily any and all sizes of wire, using large wire for materials and weaving on 100 to 700 smaller numbers of wires. It will also weave perfectly a fence with desirable barb wire at top and bottom, a style of fence needed in the southern states, and held in great favor in certain localities. Fence may be made of any desired height up to 50 inches. As to capacity, this will vary somewhat, depending upon many things, but the manufacturers state it conservatively at from 40 to 120 rods of farm fence per day. The Standard Duplex Machine makes a fence up to 48 inches high as stated above, but at a small additional cost special machines may be had which will make fence 48 and 50 inches high, respectively. The Duplex is well and honestly made of good material, and being the like ordinary care will last indefinitely. Kettisman Brothers are also large manufacturers of Ornamental and Gates. These fences are made entirely of wire and iron in the greatest variety of form and graceful design. They are so constructed that they will turn all sorts of materials with a style of fence which will enhance rather than detract from the beauty of the enclosure. The ornaments are built of solid iron and rails greatly set off and increase the beauty and strength and value of the fence. Write these manufacturers and tell them what you want in fence machines, ornamental fencing and gates and all classes of material, and be sure to mention the American Bee Journal when writing to them.

AMERICAN BEE JOURNAL
May 30, 1901.
Prof. A. J. Cook.—(See page 351.)
Weekly Budget.

When Lilacs Bloom.

When lilacs bloom, the winds grow still;
The velvet deepens on the hill;
The bee turns gaily as she greets
With long-drawn, happy, kiss the sweets
The lavish, love-flushed blossoms spill.

The daisy does her whitest frill:
The orbic his gladsome trill
Sings loud, and oft his joy repeats,
When lilacs bloom.

Then lives with careless rapture fill:
Then hearts with joy of living thrill;
And fancy weaves her golden cheats—
Ah! who would doubt the fair decrees?
No room for reason, thought, or will,
When lilacs bloom.

JESSE F. O'DONNELL.
In The Chatanqua.

Mr. G. SPEERMAN, says the British Bee Journal, probably has the largest apiary in Great Britain, containing more than 300 colonies.

Mr. A. P. Raymond, writing from Clark Co., Wis., had these kind words to say:

FRIEND YORK:—I am still reading the American Bee Journal, and am much pleased with the manner of your handling bees time to time in its bright pages, and which make it more enjoyable, if such a thing be possible.

I sincerely appreciate the successful efforts you are making to keep it up to date and abreast of the times.

A. F. Raymond.

Prof. A. J. Cook, the editor of the department of "The Home Circle" in this journal, is a man who has long been before the bee-keeping public. We think we can hardly do better than to copy what the "A.B.U. of Bee-Culture" has to say concerning Prof. Cook and his work:

Albert J. Cook was born Aug. 30, 1842, at Ossisco, Wisconsin. He was acquainted with the man will not be surprised to learn that his parents were thoroughly upright. Chas. Cook had a daily reading of the Bible, with comments by the father, reinforced by the constant example of a chaste, honest, and industrious daily life, left its impress for life on the character of the son.

At the age of 15 he entered Michigan Agricultural College, where he graduated at 22, having been obliged during his course to suffer the sharp disappointment of suspending study a whole year on account of sickness, his health having been rather delicate during his earlier years. Upon his graduation he went, on account of poor health, to California, where for three years he labored very successfully as a teacher. He then studied a portion of two years at Harvard University and Harvard Medical College with Azizzas, Hazen, and Dr. O. W. Holmes as teachers, and was later instructor at Michigan Agricultural College, and in 1885 Professor of Entomology and Zoology in the same college.

He is a life-long reader and is doing work unique in character, for he instructs the students, not only about insects in general, but about insects in particular. One incident that graduates goes all over the theory of bees, studies the bee structurally from tip of tongue to tip of sting, and goes through with all the manipulations of the apiary—that is, if there is any honey to manipulate; handles the bees, clips queens, prepares and puts on sections, extracts, etc. Probably in no other institution in the country, if in the world, would such a thing be produced. The reason only is here is because the good people don't stand together and cast it out. Some day they will unite, and then—good-by to the greatest vice, crime, and poverty breeder in the world. We believe every reader of the American Bee Journal is ready to join in the final overthrow.
Renewing Queens.—Bee-keepers differ in opinion and practice as to the matter of renewing queens. Some say it is best to leave the matter entirely to the bees. In a state of nature they always renew their queens when they have attained an age of perhaps not more than three years, in rare cases allowing them to become four or five years old. Others say it is best to have only young and vigorous queens, never tolerating a queen more than two years old, while still others put the age limit lower yet. They say, "Breed only from your best, and never allow a queen to reach an age of two years, and your stock will be constantly improving."

All agree that it is right to breed from the best, but it is not always easy to tell which is best if an age of less than two years dooms a queen to death. A queen would hardly be replaced earlier than some time in June, and the harvest of that year would be largely the work of the progeny of her predecessor. So that leaves only the harvest of one year to judge from, and that is not so good as more, for accidental causes sometimes come in the way of deciding that would not occur a second year.

The matter of wintering is to be considered. There is no doubt a difference in colonies in this respect, and a queen whose bees should winter well for three or four winters in succession, other things being equal, should have the preference.

It is possible that longevity should be considered. It is well known that sometimes a colony exceeds the average in storing, while at the same time its queen has not reared as many young as the average, and some think this is because of a difference in longevity, a worker living a week longer than the average, for a bee is not expected to do more than four weeks of field-work, usually. It is also true that some queens live longer than others under the same conditions, some queens doing as good work in the third year as the first. It is not unreasonable to suppose that if a queen is longer-lived than the average that her workers will share in that characteristic. So it might be safer to breed from a queen that had done good work for three years, and such queens would not be known unless superseding were left to the bees.

Still another point in favor of leaving the matter of superseding to the bees is that it interferes the least with the work of the bees. When a new queen is given by the bee-keeper, it may be so introduced that there will be very little interruption in the laying, but there will be almost certainly some degree of interruption, and it may be serious; whereas, in the case of superseding by the bees there need be, and generally is, no interruption, mother and daughter often laying for a time side by side.

Along with all this is the fact that it is a good deal easier for the bee-keeper to leave such matters to the bees, and so it is no great wonder that many of the most experienced say that superseding is a matter that rightfully belongs to the bees.

Scientific Breeding.—Arthur C. Miller, in Gleannings in Bee-Culture, broadly hints that editors of bee-books and authors of bee-books are ignorant upon the subject of heredity and scientific breeding—the charge which he is probably pretty safe in making; but the reading of his article does not add much to the reader's stock of knowledge upon the subject. About the only paragraph that gives any instruction up the subject is the following:

"Thoroughbred is not 'crossbred,' as any high-class stock-raiser will testify. Thorough breeding is careful, scientific in-breeding (do not confound this with in-and-in-breeding); and when alien blood is introduced the result can never be foretold with certainty, the chances being toward atavism, the reverting to a previous type."

Even that does not explain the difference between in-breeding and in-and-in-breeding—merely says they must not be confounded. The seeker after the difference who goes to the dictionary will not be helped much, for he will find one of the definitions of "in-bred" to be "in and in-breeding." But Mr. Miller's object is probably merely to call attention to the prevailing ignorance, and in that view of the case his article is timely. Never, probably, was attention so much drawn to breeding for improvement of stock, and Mr. Miller is quite right in saying, "It is high time we began to be scientific in our work. The haphazard, guess-at-it-rule-of-thumb ways have prevailed altogether too long."

Introducing Virgin Queens.—George W. Conrains says in the Australasian Bee-Keeper: "A virgin queen can be introduced with safety if there are queen-cells in the hive, but just running her in." Editor Pender replies in a footnote:

"Virgin queens can not be introduced with any certainty of success when more than an hour or two old. Any colony, having queen-cells started several days, will receive a virgin queen that has just emerged, and often such queens will be accepted by bees if allowed to run into the hive immediately the laying queen is removed, but there is so much uncertainty the practice is not usually adopted. Try a virgin say 12 hours old and I think you will fail every time."

It may be remarked that on this side the globe there is good authority for saying that a virgin queen just from the cell (not one that has been held in the cell by the bees) will be kindly accepted in any colony, whether queen-cells are present or not, even in a colony with an active laying queen. That is meant in the broadest sense, that such a queen will not be disturbed in any colony whatever, and yet such a statement without any additional word would be very misleading. Put such a virgin in a hive with a laying queen, and although she may be received ever so kindly, you may find her missing a day or two later. It looks as if the bees did not recognize any royalty about her till she attains a few hours of age after which she will not be tolerated. If, however, it is late in the season, when supersedes are likely to take place at the close of the harvest, then the bees may take the new-comer and allow her to dethrone the old queen.

Securing Control of a Territory is sometimes an easy matter, and sometimes not so easy. In making plans for extending by way of out-apiaries, Harry Lathrop says in the Bee-Keeper's Review that his first step would be to secure a suitable location where he would lease a small piece of ground in a sheltered nook, and then says:

"Having secured the land for a term of years, I will erect a small, cheap building that will serve as a shop, extracting, and bunk room. A cellar will be dug, in sloping ground, of sufficient size to winter 150 colonies, which would be the maximum number that I would expect to keep in that yard. I would fence and clean up the ground and make it as neat and handy as I could at a small expense. Then I would buy up all the bees that were for sale on the field, and begin to form my apiary . . . One can usually buy at a fair price what few bees the farmers have on such a field."

Perhaps, and yet in many cases the very fact that farmers knew a man was engaged in establishing an apiary of considerable size would arouse in them the thought that more was in bee-keeping in that locality than they had supposed, resulting in an immediate rise in price. Indeed, it has very frequently been the case that the establishment of a prosperous apiary has induced others to go into the business to a considerable extent who never thought of such a thing until they saw the establishment of that prosperous apiary.
CONVENTION PROCEEDINGS.

By Dr. L. D. Leonard.

The Minnesota State Bee-keepers Association held a convention Dec. 5, 1900, at Minneapolis. The meeting was called to order by H. G. Acklin, the chairman of the executive committee, the president, J. F. West, being ill; and, therefore, unable to be present.

After preliminary exercises, Vice-President G. H. Pond took the chair. The first business of importance was the report from a special committee, composed of Wm. Russell, H. G. Acklin and J. F. West, on the adulation of honey. This committee had collected samples of honey from different parts of the State, and took them to the Dairy and Food Commission for analysis. It is due to this society, through the efforts of this committee, that the Dairy and Food Commission have taken a more active interest in the suppression of the adulation of honey during the last year, than they ever did before.

Ques.—Is it well to extract all the honey from the brood-frames at the end of the white honey season?

Mr. Turnbull would not extract from brood-frames at all; Mr. Shepherd said the same; Mr. Perry would take part of the honey out; Mr. Boswell thought that in small hives one should not attempt to extract from the brood-frames; and Mr. Acklin believes in extracting from the brood-frames, and that sugar syrup is better for the bees to winter than honey.

AFTERNOON SESSION.

This session was held jointly with the Horticultural Society, which was holding a convention in Minneapolis at the same time. Dr. L. D. Leonard reviewed the literature relating to the mutual relations of bees and horticulture, and the following paper was written by Pres. West, on the same subject, and was read by Mrs. Acklin:

BEE-KEEPING AND HORTICULTURE.

There are a great many things which are of interest to the bee-keeper and horticulturist, and if I were present I think I should find much new to interest you, applicable to both occupations; but to write them is another thing.

I take for granted that every up-to-date horticulturist believes that bees are great agents in fertilizing, and that they are a great benefit where cross-fertilization is a benefit and is desired.

Flowers, as a general thing, are secreted only in such flowers as are incapable of self-fertilization; while those capable of being fertilized through the agency of the wind secrete no nectar to entice the bees. As examples, we see wheat, oats, barley and herds-grass, all capable of being fertilized by the rustling of their stalks by the wind. All the crows and buckwheat must be fertilized by insects. The poet puts it thus:

"Bees kissing the flowers; they sip its sweet, But make the buds more fruitful and better to eat."

Prof. Bailey, of Cornell University, a very eminent horticulturist, says bees are much more efficient agents in pollinization than wind, in our fruits, and their absence is always delectious.

Mr. Morton B. Waites, of the Division of Vegetable Pathology of the Department of Agriculture, says many varieties of apples require cross-pollination, and there are differences of opinion as to whether some of the varieties (from decide experiments), plant mixed orchards, or at least avoid planting solid blocks of one variety, and be sure there are sufficient bees in the neighborhood to visit the blossoms properly.

Mr. A. C. Perry, horticulturist commissioner of Tulare County, California, gives an instance where he has an orchard of several hundred acres. He says that bees and fruit go together; that he can not raise fruit without bees; and that he has them all over his orchard.
